

# The L<sup>A</sup>T<sub>E</sub>X3 Sources

The L<sup>A</sup>T<sub>E</sub>X Project\*

Released 2025-05-19

## Abstract

This is the typset sources for the `expl3` programming environment; see the matching `interface3` PDF for the API reference manual. The `expl3` modules set up a naming scheme for L<sup>A</sup>T<sub>E</sub>X commands, which allow the L<sup>A</sup>T<sub>E</sub>X programmer to systematically name functions and variables, and specify the argument types of functions.

The T<sub>E</sub>X and  $\varepsilon$ -T<sub>E</sub>X primitives are all given a new name according to these conventions. However, in the main direct use of the primitives is not required or encouraged: the `expl3` modules define an independent low-level L<sup>A</sup>T<sub>E</sub>X3 programming language.

The `expl3` modules are designed to be loaded on top of L<sup>A</sup>T<sub>E</sub>X 2 $\varepsilon$ . With an up-to-date L<sup>A</sup>T<sub>E</sub>X 2 $\varepsilon$  kernel, this material is loaded as part of the format. The fundamental programming code can also be loaded with other T<sub>E</sub>X formats, subject to restrictions on the full range of functionality.

# Contents

<b>I</b>	<b>Introduction</b>	<b>1</b>
<b>1</b>	<b>Introduction to <code>expl3</code> and this document</b>	<b>2</b>
1.1	Naming functions and variables . . . . .	2
1.1.1	Behavior of c-type arguments when the N-type token resulting from expansion is undefined . . . . .	5
1.1.2	Scratch variables . . . . .	5
1.1.3	Terminological inexactitude . . . . .	5
1.2	Documentation conventions . . . . .	6
1.3	Formal language conventions which apply generally . . . . .	7
1.4	TeX concepts not supported by L <sup>A</sup> T <sub>E</sub> X3 . . . . .	8
<b>II</b>	<b>Bootstrapping</b>	<b>9</b>
<b>2</b>	<b>The <code>l3bootstrap</code> module: Bootstrap code</b>	<b>10</b>
2.1	Using the L <sup>A</sup> T <sub>E</sub> X3 modules . . . . .	10
<b>3</b>	<b>The <code>l3names</code> module: Namespace for primitives</b>	<b>12</b>
3.1	Setting up the L <sup>A</sup> T <sub>E</sub> X3 programming language . . . . .	12
<b>III</b>	<b>Programming Flow</b>	<b>13</b>
<b>4</b>	<b>The <code>l3basics</code> module: Basic definitions</b>	<b>14</b>
4.1	No operation functions . . . . .	14
4.2	Grouping material . . . . .	14
4.3	Control sequences and functions . . . . .	15
4.3.1	Defining functions . . . . .	15
4.3.2	Defining new functions using parameter text . . . . .	16
4.3.3	Defining new functions using the signature . . . . .	18
4.3.4	Copying control sequences . . . . .	20
4.3.5	Deleting control sequences . . . . .	21
4.3.6	Showing control sequences . . . . .	21
4.3.7	Converting to and from control sequences . . . . .	22
4.4	Analysing control sequences . . . . .	23
4.5	Using or removing tokens and arguments . . . . .	24
4.5.1	Selecting tokens from delimited arguments . . . . .	27
4.6	Predicates and conditionals . . . . .	28
4.6.1	Tests on control sequences . . . . .	29
4.6.2	Primitive conditionals . . . . .	29
4.7	Starting a paragraph . . . . .	31
4.8	Debugging support . . . . .	31

<b>5</b>	<b>The <code>l3expan</code> module: Argument expansion</b>	<b>32</b>
5.1	Defining new variants . . . . .	32
5.2	Methods for defining variants . . . . .	33
5.3	Introducing the variants . . . . .	35
5.4	Manipulating the first argument . . . . .	36
5.5	Manipulating two arguments . . . . .	38
5.6	Manipulating three arguments . . . . .	38
5.7	Unbraced expansion . . . . .	40
5.8	Preventing expansion . . . . .	41
5.9	Controlled expansion . . . . .	42
5.10	Internal functions . . . . .	44
<b>6</b>	<b>The <code>l3sort</code> module: Sorting functions</b>	<b>45</b>
6.1	Controlling sorting . . . . .	45
<b>7</b>	<b>The <code>l3tl-analysis</code> module: Analysing token lists</b>	<b>47</b>
<b>8</b>	<b>The <code>l3regex</code> module: Regular expressions in <math>\text{\TeX}</math></b>	<b>48</b>
8.1	Syntax of regular expressions . . . . .	49
8.1.1	Regular expression examples . . . . .	49
8.1.2	Characters in regular expressions . . . . .	50
8.1.3	Characters classes . . . . .	50
8.1.4	Structure: alternatives, groups, repetitions . . . . .	51
8.1.5	Matching exact tokens . . . . .	52
8.1.6	Miscellaneous . . . . .	54
8.2	Syntax of the replacement text . . . . .	54
8.3	Pre-compiling regular expressions . . . . .	56
8.4	Matching . . . . .	57
8.5	Submatch extraction . . . . .	58
8.6	Replacement . . . . .	59
8.7	Scratch regular expressions . . . . .	61
8.8	Bugs, misfeatures, future work, and other possibilities . . . . .	61
<b>9</b>	<b>The <code>l3prg</code> module: Control structures</b>	<b>64</b>
9.1	Defining a set of conditional functions . . . . .	65
9.2	The boolean data type . . . . .	67
9.2.1	Constant and scratch booleans . . . . .	69
9.3	Boolean expressions . . . . .	69
9.4	Logical loops . . . . .	71
9.5	Producing multiple copies . . . . .	73
9.6	Detecting $\text{\TeX}$ 's mode . . . . .	73
9.7	Primitive conditionals . . . . .	74
9.8	Nestable recursions and mappings . . . . .	74
9.8.1	Simple mappings . . . . .	75
9.9	Internal programming functions . . . . .	75

<b>10 The <code>l3sys</code> module: System/runtime functions</b>	<b>76</b>
10.1 The name of the job . . . . .	76
10.2 Date and time . . . . .	76
10.3 Engine . . . . .	77
10.4 Output format . . . . .	78
10.5 Platform . . . . .	79
10.6 Random numbers . . . . .	79
10.7 Access to the shell . . . . .	80
10.8 System queries . . . . .	81
10.9 Loading configuration data . . . . .	82
10.9.1 Final settings . . . . .	82
<b>11 The <code>l3msg</code> module: Messages</b>	<b>83</b>
11.1 Creating new messages . . . . .	83
11.2 Customizable information for message modules . . . . .	84
11.3 Contextual information for messages . . . . .	85
11.4 Issuing messages . . . . .	86
11.4.1 Messages for showing material . . . . .	90
11.4.2 Expandable error messages . . . . .	90
11.5 Redirecting messages . . . . .	91
<b>12 The <code>l3file</code> module: File and I/O operations</b>	<b>93</b>
12.1 Input–output stream management . . . . .	93
12.1.1 Reading from files . . . . .	95
12.1.2 Reading from the terminal . . . . .	99
12.1.3 Writing to files . . . . .	99
12.1.4 Wrapping lines in output . . . . .	101
12.1.5 Constant input–output streams, and variables . . . . .	102
12.1.6 Primitive conditionals . . . . .	102
12.2 File operations . . . . .	102
12.2.1 Basic file operations . . . . .	102
12.2.2 Information about files and file contents . . . . .	103
12.2.3 Accessing file contents . . . . .	106
<b>13 The <code>l3luatex</code> module: Lua<sub>TeX</sub>-specific functions</b>	<b>108</b>
13.1 Breaking out to Lua . . . . .	108
13.2 Lua interfaces . . . . .	109
<b>14 The <code>l3legacy</code> module: Interfaces to legacy concepts</b>	<b>111</b>
 <b>IV Data types</b>	 <b>112</b>

<b>15 The <code>l3tl</code> module: Token lists</b>	<b>113</b>
15.1 Creating and initialising token list variables	113
15.2 Adding data to token list variables	114
15.3 Token list conditionals	115
15.3.1 Testing the first token	117
15.4 Working with token lists as a whole	118
15.4.1 Using token lists	118
15.4.2 Counting and reversing token lists	119
15.4.3 Viewing token lists	121
15.5 Manipulating items in token lists	122
15.5.1 Mapping over token lists	122
15.5.2 Head and tail of token lists	124
15.5.3 Items and ranges in token lists	125
15.5.4 Sorting token lists	128
15.6 Manipulating tokens in token lists	128
15.6.1 Replacing tokens	128
15.6.2 Reassigning category codes	130
15.7 Constant token lists	131
15.8 Scratch token lists	131
<b>16 The <code>l3tl-build</code> module: Piecewise <code>tl</code> constructions</b>	<b>133</b>
16.1 Constructing <code>&lt;tl var&gt;</code> by accumulation	133
<b>17 The <code>l3str</code> module: Strings</b>	<b>135</b>
17.1 Creating and initialising string variables	136
17.2 Adding data to string variables	137
17.3 String conditionals	137
17.4 Mapping over strings	139
17.5 Working with the content of strings	141
17.6 Modifying string variables	144
17.7 String manipulation	145
17.8 Viewing strings	146
17.9 Constant strings	147
17.10 Scratch strings	147
<b>18 The <code>l3str-convert</code> module: String encoding conversions</b>	<b>148</b>
18.1 Encoding and escaping schemes	148
18.2 Conversion functions	150
18.3 Conversion by expansion (for PDF contexts)	150
18.4 Possibilities, and things to do	150
<b>19 The <code>l3quark</code> module: Quarks and scan marks</b>	<b>152</b>
19.1 Quarks	152
19.2 Defining quarks	153
19.3 Quark tests	153
19.4 Recursion	154
19.4.1 An example of recursion with quarks	155
19.5 Scan marks	156

<b>20 The l3seq module: Sequences and stacks</b>	<b>157</b>
20.1 Creating and initialising sequences . . . . .	157
20.2 Appending data to sequences . . . . .	160
20.3 Recovering items from sequences . . . . .	160
20.4 Recovering values from sequences with branching . . . . .	162
20.5 Modifying sequences . . . . .	163
20.6 Sequence conditionals . . . . .	164
20.7 Mapping over sequences . . . . .	164
20.8 Using the content of sequences directly . . . . .	167
20.9 Sequences as stacks . . . . .	168
20.10 Sequences as sets . . . . .	169
20.11 Constant and scratch sequences . . . . .	170
20.12 Viewing sequences . . . . .	171
<b>21 The l3int module: Integers</b>	<b>172</b>
21.1 Integer expressions . . . . .	172
21.2 Creating and initialising integers . . . . .	174
21.3 Setting and incrementing integers . . . . .	175
21.4 Using integers . . . . .	176
21.5 Integer expression conditionals . . . . .	176
21.6 Integer expression loops . . . . .	178
21.7 Integer step functions . . . . .	180
21.8 Formatting integers . . . . .	181
21.9 Converting from other formats to integers . . . . .	183
21.10 Random integers . . . . .	184
21.11 Viewing integers . . . . .	184
21.12 Constant integers . . . . .	184
21.13 Scratch integers . . . . .	185
21.14 Direct number expansion . . . . .	185
21.15 Primitive conditionals . . . . .	186
<b>22 The l3flag module: Expandable flags</b>	<b>187</b>
22.1 Setting up flags . . . . .	187
22.2 Expandable flag commands . . . . .	188
<b>23 The l3clist module: Comma separated lists</b>	<b>190</b>
23.1 Creating and initialising comma lists . . . . .	191
23.2 Adding data to comma lists . . . . .	192
23.3 Modifying comma lists . . . . .	193
23.4 Comma list conditionals . . . . .	194
23.5 Mapping over comma lists . . . . .	194
23.6 Using the content of comma lists directly . . . . .	197
23.7 Comma lists as stacks . . . . .	198
23.8 Using a single item . . . . .	199
23.9 Viewing comma lists . . . . .	199
23.10 Constant and scratch comma lists . . . . .	200

<b>24 The <code>l3token</code> module: Token manipulation</b>	<b>201</b>
24.1 Creating character tokens . . . . .	202
24.2 Manipulating and interrogating character tokens . . . . .	203
24.3 Generic tokens . . . . .	206
24.4 Converting tokens . . . . .	207
24.5 Token conditionals . . . . .	207
24.6 Peeking ahead at the next token . . . . .	212
24.7 Description of all possible tokens . . . . .	216
<b>25 The <code>l3prop</code> module: Property lists</b>	<b>219</b>
25.1 Creating and initialising property lists . . . . .	220
25.2 Adding and updating property list entries . . . . .	222
25.3 Recovering values from property lists . . . . .	223
25.4 Modifying property lists . . . . .	224
25.5 Property list conditionals . . . . .	224
25.6 Recovering values from property lists with branching . . . . .	225
25.7 Mapping over property lists . . . . .	226
25.8 Viewing property lists . . . . .	227
25.9 Scratch property lists . . . . .	228
25.10 Constants . . . . .	228
<b>26 The <code>l3skip</code> module: Dimensions and skips</b>	<b>229</b>
26.1 Creating and initialising <code>dim</code> variables . . . . .	229
26.2 Setting <code>dim</code> variables . . . . .	230
26.3 Utilities for dimension calculations . . . . .	230
26.4 Dimension expression conditionals . . . . .	231
26.5 Dimension expression loops . . . . .	233
26.6 Dimension step functions . . . . .	234
26.7 Using <code>dim</code> expressions and variables . . . . .	235
26.8 Viewing <code>dim</code> variables . . . . .	237
26.9 Constant dimensions . . . . .	238
26.10 Scratch dimensions . . . . .	238
26.11 Creating and initialising <code>skip</code> variables . . . . .	238
26.12 Setting <code>skip</code> variables . . . . .	239
26.13 Skip expression conditionals . . . . .	240
26.14 Using <code>skip</code> expressions and variables . . . . .	240
26.15 Viewing <code>skip</code> variables . . . . .	240
26.16 Constant skips . . . . .	241
26.17 Scratch skips . . . . .	241
26.18 Inserting skips into the output . . . . .	241
26.19 Creating and initialising <code>muskip</code> variables . . . . .	242
26.20 Setting <code>muskip</code> variables . . . . .	242
26.21 Using <code>muskip</code> expressions and variables . . . . .	243
26.22 Viewing <code>muskip</code> variables . . . . .	243
26.23 Constant muskips . . . . .	244
26.24 Scratch muskips . . . . .	244
26.25 Primitive conditional . . . . .	244

<b>27 The <code>l3keys</code> module: Key–value interfaces</b>	<b>245</b>
27.1 Creating keys . . . . .	246
27.2 Sub-dividing keys . . . . .	251
27.3 Choice and multiple choice keys . . . . .	252
27.4 Key usage scope . . . . .	254
27.5 Setting keys . . . . .	254
27.6 Handling of unknown keys . . . . .	255
27.7 Selective key setting . . . . .	255
27.8 Precompiling keys . . . . .	257
27.9 Utility functions for keys . . . . .	258
27.10 Low-level interface for parsing key–val lists . . . . .	258
<b>28 The <code>l3intarray</code> module: Fast global integer arrays</b>	<b>261</b>
28.1 Creating and initialising integer array variables . . . . .	261
28.2 Adding data to integer arrays . . . . .	262
28.3 Counting entries in integer arrays . . . . .	262
28.4 Using a single entry . . . . .	262
28.5 Integer array conditional . . . . .	262
28.6 Viewing integer arrays . . . . .	262

<b>37 The l3color module: Color support</b>	<b>329</b>
37.1 Color in boxes . . . . .	329
37.2 Color models . . . . .	329
37.3 Color expressions . . . . .	331
37.4 Named colors . . . . .	332
37.5 Selecting colors . . . . .	332
37.6 Colors for fills and strokes . . . . .	333
37.6.1 Coloring math mode material . . . . .	333
37.7 Multiple color models . . . . .	334
37.8 Exporting color specifications . . . . .	334
37.9 Creating new color models . . . . .	335
37.9.1 Color profiles . . . . .	336
<b>38 The l3graphics module: Graphics inclusion support</b>	<b>337</b>
38.1 Graphics keys . . . . .	337
38.2 Including graphics . . . . .	338
38.3 Utility functions . . . . .	338
38.4 Showing and logging included graphics . . . . .	339
<b>39 The l3opacity module: Opacity (transparency) support</b>	<b>340</b>
39.1 Selecting opacity . . . . .	340
<b>40 The l3pdf module: Core PDF support</b>	<b>341</b>
40.1 Objects . . . . .	341
40.1.1 Named objects . . . . .	341
40.1.2 Indexed objects . . . . .	342
40.1.3 General functions . . . . .	342
40.2 Version . . . . .	343
40.3 Page (media) size . . . . .	343
40.4 Compression . . . . .	343
40.5 Destinations . . . . .	344
<b>VII Utilities</b>	<b>345</b>
<b>41 The l3benchmark module: Benchmarking</b>	<b>346</b>
41.1 Benchmark . . . . .	346
<b>VIII Implementation</b>	<b>348</b>
<b>42 l3bootstrap implementation</b>	<b>349</b>
42.1 The \pdfstrcmp primitive in XeTeX . . . . .	349
42.2 Loading support Lua code . . . . .	349
42.3 Engine requirements . . . . .	350
42.4 The L <sup>A</sup> T <sub>E</sub> X3 code environment . . . . .	351
<b>43 l3names implementation</b>	<b>353</b>

<b>44</b>	<b>l3kernel-functions: kernel-reserved functions</b>	<b>379</b>
44.1	Internal l3debug kernel functions	379
44.2	Internal kernel functions	380
44.3	Kernel backend functions	387
<b>45</b>	<b>l3basics implementation</b>	<b>389</b>
45.1	Renaming some T <sub>E</sub> X primitives (again)	389
45.2	Defining some constants	391
45.3	Defining functions	391
45.4	Selecting tokens	392
45.5	Gobbling tokens from input	395
45.6	Debugging and patching later definitions	395
45.7	Conditional processing and definitions	396
45.8	Dissecting a control sequence	402
45.9	Exist or free	404
45.10	Preliminaries for new functions	407
45.11	Defining new functions	408
45.12	Copying definitions	410
45.13	Undefining functions	411
45.14	Generating parameter text from argument count	411

**Part I**  
**Introduction**

# Chapter 1

## Introduction to expl3 and this document

This document is intended to act as a comprehensive reference manual for the expl3 language. A general guide to the L<sup>A</sup>T<sub>E</sub>X3 programming language is found in [expl3.pdf](#).

### 1.1 Naming functions and variables

L<sup>A</sup>T<sub>E</sub>X3 does not use @ as a “letter” for defining internal macros. Instead, the symbols \_ and : are used in internal macro names to provide structure. The name of each *function* is divided into logical units using \_, while : separates the *name* of the function from the *argument specifier* (“arg-spec”). This describes the arguments expected by the function. In most cases, each argument is represented by a single letter. The complete list of arg-spec letters for a function is referred to as the *signature* of the function.

Each function name starts with the *module* to which it belongs. Thus apart from a small number of very basic functions, all expl3 function names contain at least one underscore to divide the module name from the descriptive name of the function. For example, all functions concerned with comma lists are in module `clist` and begin `\clist_`.

Every function must include an argument specifier. For functions which take no arguments, this will be blank and the function name will end `:`. Most functions take one or more arguments, and use the following argument specifiers:

- N and n** These mean *no manipulation*, of a single token for `N` and of a set of tokens given in braces for `n`. Both pass the argument through exactly as given. Usually, if you use a single token for an `n` argument, all will be well.
- c** This means *cname*, and indicates that the argument will be turned into a `cname` before being used. So `\foo:c {ArgumentOne}` will act in the same way as `\foo:N \ArgumentOne`. All macros that appear in the argument are expanded. An internal error will occur if the result of expansion inside a `c`-type argument is not a series of character tokens.
- V and v** These mean *value of variable*. The `V` and `v` specifiers are used to get the content of a variable without needing to worry about the underlying T<sub>E</sub>X structure containing the data. A `V` argument will be a single token (similar to `N`), for example

`\foo:V \MyVariable`; on the other hand, using `v` a csname is constructed first, and then the value is recovered, for example `\foo:v {MyVariable}`.

- o This means *expansion once*. In general, the `V` and `v` specifiers are favoured over `o` for recovering stored information. However, `o` is useful for correctly processing information with delimited arguments.
- x The `x` specifier stands for *exhaustive expansion*: every token in the argument is fully expanded until only unexpandable ones remain. The `\edef` primitive carries out this type of expansion. Functions which feature an `x`-type argument are *not* expandable.
- e The `e` specifier is in many respects identical to `x`, but uses `\expanded` primitive. Parameter character (usually `#`) in the argument need not be doubled. Functions which feature an `e`-type argument may be expandable.
- f The `f` specifier stands for *full expansion*, and in contrast to `x` stops at the first non-expandable token (reading the argument from left to right) without trying to expand it. If this token is a *space token*, it is gobbled, and thus won't be part of the resulting argument. For example, when setting a token list variable (a macro used for storage), the sequence

```
\tl_set:Nn \l_my_a_tl { A }
\tl_set:Nn \l_my_b_tl { B }
\tl_set:Nf \l_my_a_tl { \l_my_a_tl \l_my_b_tl }
```

will leave `\l_my_a_tl` with the content `A\l_my_b_tl`, as `A` cannot be expanded and so terminates expansion before `\l_my_b_tl` is considered.

- T and F** For logic tests, there are the branch specifiers `T` (*true*) and `F` (*false*). Both specifiers treat the input in the same way as `n` (no change), but make the logic much easier to see.
- p The letter `p` indicates `TeX parameters`. Normally this will be used for delimited functions as `expl3` provides better methods for creating simple sequential arguments.
- w Finally, there is the `w` specifier for *weird* arguments. This covers everything else, but mainly applies to delimited values (where the argument must be terminated by some specified string).
- D The `D` stands for **Do not use**. All of the `TeX` primitives are initially `\let` to a `D` name, and some are then given a second name. These functions have no standardized syntax, they are engine dependent and their name can change without warning, thus their use is *strongly discouraged* in package code: programmers should instead use the interfaces documented in [interface3.pdf](#).

Notice that the argument specifier describes how the argument is processed prior to being passed to the underlying function. For example, `\foo:c` will take its argument, convert it to a control sequence and pass it to `\foo:N`.

Variables are named in a similar manner to functions, but begin with a single letter to define the type of variable:

- c Constant: global parameters whose value should not be changed.

**g** Parameters whose value should only be set globally.

**l** Parameters whose value should only be set locally.

Each variable name is then build up in a similar way to that of a function, typically starting with the module<sup>1</sup> name and then a descriptive part. Variables end with a short identifier to show the variable type:

**bitset** a set of bits (a string made up of a series of 0 and 1 tokens that are accessed by position).

**clist** Comma separated list.

**dim** “Rigid” lengths.

**fp** Floating-point values;

**int** Integer-valued count register.

**muskip** “Rubber” lengths for use in mathematics.

**skip** “Rubber” lengths.

**str** String variables: contain character data.

**tl** Token list variables: placeholder for a token list.

Applying **V**-type or **v**-type expansion to variables of one of the above types is supported, while it is not supported for the following variable types:

**bool** Either true or false.

**box** Box register.

**coffin** A “box with handles” — a higher-level data type for carrying out **box** alignment operations.

**flag** Non-negative integer that can be incremented expandably.

**fparray** Fixed-size array of floating point values.

**intarray** Fixed-size array of integers.

**ior/iow** An input or output stream, for reading from or writing to, respectively.

**prop** Property list: analogue of dictionary or associative arrays in other languages.

**regex** Regular expression.

**seq** “Sequence”: a data type used to implement lists (with access at both ends) and stacks.

---

<sup>1</sup>The module names are not used in case of generic scratch registers defined in the data type modules, e.g., the **int** module contains some scratch variables called `\l_tmpa_int`, `\l_tmpl_int`, and so on. In such a case adding the module name up front to denote the module and in the back to indicate the type, as in `\l_int_tmpa_int` would be very unreadable.

### 1.1.1 Behavior of c-type arguments when the N-type token resulting from expansion is undefined

When c-type expansion is applied, it will produce an N-type token to be consumed by the underlying function. If the result of this process is a token which is undefined, TeX’s behavior is to make it equal to `\scan_stop: (\relax)`.

This will likely lead to low-level errors if it occurs in contexts where `expl3` expects a “variable”, e.g. a `prop`, `seq`, etc. Therefore, the programmer should ensure that c-type expansion is only applied when the resulting N-type token will definitely exist, i.e., when it is either defined prior to the application of the c-type expansion or will be by the underlying N-type function.

### 1.1.2 Scratch variables

Modules focussed on variable usage typically provide four scratch variables, two local and two global, with names of the form `\<scope>_tmpa_<type>/\<scope>_tmpb_<type>`. These are never used by the core code. The nature of TeX grouping means that as with any other scratch variable, these should only be set and used with no intervening third-party code.

There are two more special types of constants:

**q** Quark constants.

**s** Scan mark constants.

Similarly, each quark or scan mark name starts with the module name, but doesn’t end with a variable type, because the type is already marked by the prefix `q` or `s`. Some general quarks and scan marks provided by L<sup>A</sup>T<sub>E</sub>X3 don’t start with a module name, for example `\s_stop`. See documentation of quarks and scan marks in Chapter VIII for more info.

### 1.1.3 Terminological inexactitude

A word of warning. In this document, and others referring to the `expl3` programming modules, we often refer to “variables” and “functions” as if they were actual constructs from a real programming language. In truth, TeX is a macro processor, and functions are simply macros that may or may not take arguments and expand to their replacement text. Many of the common variables are *also* macros, and if placed into the input stream will simply expand to their definition as well — a “function” with no arguments and a “token list variable” are almost the same.<sup>2</sup> On the other hand, some “variables” are actually registers that must be initialised and their values set and retrieved with specific functions.

The conventions of the `expl3` code are designed to clearly separate the ideas of “macros that contain data” and “macros that contain code”, and a consistent wrapper is applied to all forms of “data” whether they be macros or actually registers. This means that sometimes we will use phrases like “the function returns a value”, when actually we just mean “the macro expands to something”. Similarly, the term “execute” might be used in place of “expand” or it might refer to the more specific case of “processing in TeX’s stomach” (if you are familiar with the TeXbook parlance).

If in doubt, please ask; chances are we’ve been hasty in writing certain definitions and need to be told to tighten up our terminology.

---

<sup>2</sup>TeXnically, functions with no arguments are `\long` while token list variables are not.

## 1.2 Documentation conventions

This document is typeset with the experimental `l3doc` class; several conventions are used to help describe the features of the code. A number of conventions are used here to make the documentation clearer.

Each group of related functions is given in a box. For a function with a “user” name, this might read:

---

<code>\ExplSyntaxOn</code> <code>\ExplSyntaxOff</code>	<code>\ExplSyntaxOn ... \ExplSyntaxOff</code> The textual description of how the function works would appear here. The syntax of the function is shown in mono-spaced text to the right of the box. In this example, the function takes no arguments and so the name of the function is simply reprinted.
---	--

---

For programming functions, which use `_` and `:` in their name there are a few additional conventions: If two related functions are given with identical names but different argument specifiers, these are termed *variants* of each other, and the latter functions are printed in grey to show this more clearly. They will carry out the same function but will take different types of argument:

---

<code>\seq_new:N</code> <code>\seq_new:c</code>	<code>\seq_new:N &lt;seq var&gt;</code> When a number of variants are described, the arguments are usually illustrated only for the base function. Here, <code>&lt;seq var&gt;</code> indicates that <code>\seq_new:N</code> expects a sequence variable. From the argument specifier, <code>\seq_new:c</code> also expects a sequence variable, but as a name rather than as a control sequence. Each argument given in the illustration should be described in the following text.
--	---

---

**Fully expandable functions** Some functions are fully expandable, which allows them to be used within an `x`-type or `e`-type argument (in plain `TEX` terms, inside an `\edef` or `\expanded`), as well as within an `f`-type argument. These fully expandable functions are indicated in the documentation by a star:

---

<code>\cs_to_str:N</code> ☆	<code>\cs_to_str:N &lt;cs&gt;</code> As with other functions, some text should follow which explains how the function works. Usually, only the star will indicate that the function is expandable. In this case, the function expects a <code>&lt;cs&gt;</code> , shorthand for a <code>&lt;control sequence&gt;</code> .
-----------------------------	--

---

**Restricted expandable functions** A few functions are fully expandable but cannot be fully expanded within an `f`-type argument. In this case a hollow star is used to indicate this:

---

<code>\seq_map_function:NN</code> ☆	<code>\seq_map_function:NN &lt;seq var&gt; &lt;function&gt;</code>
-------------------------------------	--

---

**Conditional functions** Conditional (`if`) functions are normally defined in three variants, with `T`, `F` and `TF` argument specifiers. This allows them to be used for different “true”/“false” branches, depending on which outcome the conditional is being used to test. To indicate this without repetition, this information is given in a shortened form:

---

---

```
\sys_if_engine_xetex:TF ★ \sys_if_engine_xetex:TF {\true code} {\false code}
```

---

The underlining and italic of TF indicates that three functions are available:

- \sys\_if\_engine\_xetex:T
- \sys\_if\_engine\_xetex:F
- \sys\_if\_engine\_xetex:TF

Usually, the illustration will use the TF variant, and so both `<true code>` and `<false code>` will be shown. The two variant forms T and F take only `<true code>` and `<false code>`, respectively. Here, the star also shows that this function is expandable. With some minor exceptions, *all* conditional functions in the `expl3` modules should be defined in this way.

Variables, constants and so on are described in a similar manner:

---

```
\l_tmpa_tl A short piece of text will describe the variable: there is no syntax illustration in this case.
```

---

In some cases, the function is similar to one in L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> or plain T<sub>E</sub>X. In these cases, the text will include an extra “**T<sub>E</sub>Xhackers note**” section:

---

```
\token_to_str:N ★ \token_to_str:N <token>
```

---

The normal description text.

**T<sub>E</sub>Xhackers note:** Detail for the experienced T<sub>E</sub>X or L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> programmer. In this case, it would point out that this function is the T<sub>E</sub>X primitive `\string`.

**Changes to behaviour** When new functions are added to `expl3`, the date of first inclusion is given in the documentation. Where the documented behaviour of a function changes after it is first introduced, the date of the update will also be given. This means that the programmer can be sure that any release of `expl3` after the date given will contain the function of interest with expected behaviour as described. Note that changes to code internals, including bug fixes, are not recorded in this way *unless* they impact on the expected behaviour.

## 1.3 Formal language conventions which apply generally

As this is a formal reference guide for L<sup>A</sup>T<sub>E</sub>X 3 programming, the descriptions of functions are intended to be reasonably “complete”. However, there is also a need to avoid repetition. Formal ideas which apply to general classes of function are therefore summarised here.

For tests which have a TF argument specification, the test is evaluated to give a logically TRUE or FALSE result. Depending on this result, either the `<true code>` or the `<false code>` will be left in the input stream. In the case where the test is expandable, and a predicate (`_p`) variant is available, the logical value determined by the test is left in the input stream: this will typically be part of a larger logical construct.

## 1.4 T<sub>E</sub>X concepts not supported by L<sup>A</sup>T<sub>E</sub>X3

The T<sub>E</sub>X concept of an “\outer” macro is *not supported* at all by L<sup>A</sup>T<sub>E</sub>X3. As such, the functions provided here may break when used on top of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> if \outer tokens are used in the arguments.

**Part II**  
**Bootstrapping**

## Chapter 2

# The l3bootstrap module

## Bootstrap code

### 2.1 Using the L<sup>A</sup>T<sub>E</sub>X3 modules

The modules documented in `interface3` (and this file) are designed to be used on top of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and are already pre-loaded since L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> 2020-02-02. To support older formats, the `\usepackage{expl3}` or `\RequirePackage{expl3}` instructions are still available to load them all as one.

As the modules use a coding syntax different from standard L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> it provides a few functions for setting it up.

---

<code>\ExplSyntaxOn</code>	<code>\ExplSyntaxOn &lt;code&gt; \ExplSyntaxOff</code>
----------------------------	--

---

<code>\ExplSyntaxOff</code>	
-----------------------------	--

---

Updated: 2011-08-13	
---------------------	--

---

The `\ExplSyntaxOn` function switches to a category code régime in which spaces and new lines are ignored, and in which the colon (`:`) and underscore (`_`) are treated as “letters”, thus allowing access to the names of code functions and variables. Within this environment, `~` is used to input a space. The `\ExplSyntaxOff` reverts to the document category code régime.

**T<sub>E</sub>Xhackers note:** Spaces introduced by `~` behave much in the same way as normal space characters in the standard category code régime: they are ignored after a control word or at the start of a line, and multiple consecutive `~` are equivalent to a single one. However, `~` is *not* ignored at the end of a line.

---

<code>\ProvidesExplPackage</code>	<code>\ProvidesExplPackage {&lt;package&gt;} {&lt;date&gt;} {&lt;version&gt;} {&lt;description&gt;}</code>
<code>\ProvidesExplClass</code>	
<code>\ProvidesExplFile</code>	

---

Updated: 2023-08-03	
---------------------	--

---

These functions act broadly in the same way as the corresponding L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> kernel functions `\ProvidesPackage`, `\ProvidesClass` and `\ProvidesFile`. However, they also implicitly switch `\ExplSyntaxOn` for the remainder of the code with the file. At the end of the file, `\ExplSyntaxOff` will be called to reverse this. (This is the same concept as L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> provides in turning on `\makeatletter` within package and class code.) The `<date>` should be given in the format `<year>/<month>/<day>` or in the ISO date format `<year>-<month>-<day>`. If the `<version>` is given then a leading `v` is optional: if given as a “pure” version string, a `v` will be prepended.

<hr/> <b>\GetIdInfo</b> <hr/>	<b>\GetIdInfo \$Id: <i>&lt;SVN info field&gt;</i> \$ <i>{&lt;description&gt;}</i>}</b>
<b>Updated: 2012-06-04</b> <hr/>	<p>Extracts all information from a SVN field. Spaces are not ignored in these fields. The information pieces are stored in separate control sequences with <b>\ExplFileName</b> for the part of the file name leading up to the period, <b>\ExplFileDate</b> for date, <b>\ExplFileVersion</b> for version and <b>\ExplFileDescription</b> for the description.</p> <p>To summarize: Every single package using this syntax should identify itself using one of the above methods. Special care is taken so that every package or class file loaded with <b>\RequirePackage</b> or similar are loaded with usual L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> category codes and the L<sup>A</sup>T<sub>E</sub>X 3 category code scheme is reloaded when needed afterwards. See implementation for details. If you use the <b>\GetIdInfo</b> command you can use the information when loading a package with</p>

```

\ProvidesExplPackage{\ExplFileName}
{\ExplFileDate}{\ExplFileVersion}{\ExplFileDescription}

```

## Chapter 3

# The l3names module Namespace for primitives

### 3.1 Setting up the L<sup>A</sup>T<sub>E</sub>X3 programming language

This module is at the core of the L<sup>A</sup>T<sub>E</sub>X3 programming language. It performs the following tasks:

- defines new names for all T<sub>E</sub>X primitives;
- emulate required primitives not provided by default in LuaT<sub>E</sub>X;
- switches to the category code régime for programming;

This module is entirely dedicated to primitives (and emulations of these), which should not be used directly within L<sup>A</sup>T<sub>E</sub>X3 code (outside of “kernel-level” code). As such, the primitives are not documented here: *The T<sub>E</sub>Xbook*, *T<sub>E</sub>X by Topic* and the manuals for pdfT<sub>E</sub>X, X<sub>Y</sub>T<sub>E</sub>X, LuaT<sub>E</sub>X, pT<sub>E</sub>X and upT<sub>E</sub>X should be consulted for details of the primitives. These are named `\tex_⟨name⟩:D`, typically based on the primitive’s `⟨name⟩` in pdfT<sub>E</sub>X and omitting a leading `pdf` when the primitive is not related to pdf output.

**Part III**  
**Programming Flow**

## Chapter 4

# The l3basics module

## Basic definitions

As the name suggests, this module holds some basic definitions which are needed by most or all other modules in this set.

Here we describe those functions that are used all over the place. By that, we mean functions dealing with the construction and testing of control sequences. Furthermore the basic parts of conditional processing are covered; conditional processing dealing with specific data types is described in the modules specific for the respective data types.

### 4.1 No operation functions

---

<code>\prg_do_nothing:</code>	★	<code>\prg_do_nothing:</code>
-------------------------------	---	-------------------------------

An expandable function which does nothing at all: leaves nothing in the input stream after a single expansion.

---

<code>\scan_stop:</code>	<code>\scan_stop:</code>
--------------------------	--------------------------

A non-expandable function which does nothing. Does not vanish on expansion but produces no typeset output.

### 4.2 Grouping material

---

<code>\group_begin:</code>	<code>\group_begin:</code>
<code>\group_end:</code>	<code>\group_end:</code>

---

These functions begin and end a group for definition purposes. Assignments are local to groups unless carried out in a global manner. (A small number of exceptions to this rule will be noted as necessary elsewhere in this document.) Each `\group_begin:` must be matched by a `\group_end:`, although this does not have to occur within the same function. Indeed, it is often necessary to start a group within one function and finish it within another, for example when seeking to use non-standard category codes.

**T<sub>E</sub>Xhackers note:** These are the T<sub>E</sub>X primitives `\begingroup` and `\endgroup`.

---

<code>\group_insert_after:N</code>	<code>\group_insert_after:N</code> $\langle token \rangle$
------------------------------------	--

---

Adds  $\langle token \rangle$  to the list of  $\langle tokens \rangle$  to be inserted when the current group level ends. The list of  $\langle tokens \rangle$  to be inserted is empty at the beginning of a group: multiple applications of `\group_insert_after:N` may be used to build the inserted list one  $\langle token \rangle$  at a time. The current group level may be closed by a `\group_end:` function or by a token with category code 2 (close-group), namely a `}` if standard category codes apply.

**TeXhackers note:** This is the TeX primitive `\aftergroup`.

---

<code>\group_show_list:</code>	<code>\group_show_list:</code>
<code>\group_log_list:</code>	<code>\group_log_list:</code>

---

New: 2021-05-11

Display (to the terminal or log file) a list of the groups that are currently opened. This is intended for tracking down problems.

**TeXhackers note:** This is a wrapper around the  $\epsilon$ -TeX primitive `\showgroups`.

## 4.3 Control sequences and functions

As TeX is a macro language, creating new functions means creating macros. At point of use, a function is replaced by the replacement text (“code”) in which each parameter in the code (`#1`, `#2`, etc.) is replaced the appropriate arguments absorbed by the function. In the following,  $\langle code \rangle$  is therefore used as a shorthand for “replacement text”.

Functions which are not “protected” are fully expanded inside an **e**-type or **x**-type expansion. In contrast, “protected” functions are not expanded within **e** and **x** expansions.

### 4.3.1 Defining functions

Functions can be created with no requirement that they are declared first (in contrast to variables, which must always be declared). Declaring a function before setting up the code means that the name chosen is checked and an error raised if it is already in use. The name of a function can be checked at the point of definition using the `\cs_new...` functions: this is recommended for all functions which are defined for the first time.

There are three ways to define new functions. All classes define a function to expand to the substitution text. Within the substitution text the actual parameters are substituted for the formal parameters (`#1`, `#2`, ...).

**new** Create a new function with the **new** scope, such as `\cs_new:Npn`. The definition is global and results in an error if it is already defined.

**set** Create a new function with the **set** scope, such as `\cs_set:Npn`. The definition is restricted to the current TeX group and does not result in an error if the function is already defined.

**gset** Create a new function with the **gset** scope, such as `\cs_gset:Npn`. The definition is global and does not result in an error if the function is already defined.

Within each set of scope there are different ways to define a function. The differences depend on restrictions on the actual parameters and the expandability of the resulting function.

**nopar** Create a new function with the `nopar` restriction, such as `\cs_set_nopar:Npn`. The parameter may not contain `\par` tokens.

**protected** Create a new function with the `protected` restriction, such as `\cs_set_protected:Npn`. The parameter may contain `\par` tokens but the function will not expand within an `e`-type or `x`-type expansion.

Finally, the functions in Subsections 4.3.2 and 4.3.3 are primarily meant to define *base functions* only. Base functions can only have the following argument specifiers:

**N and n** No manipulation.

**T and F** Functionally equivalent to `n` (you are actually encouraged to use the family of `\prg_new_conditional:` functions described in Section 9.1).

**p and w** These are special cases.

The `\cs_new:` functions below (and friends) do not stop you from using other argument specifiers in your function names, but they do not handle expansion for you. You should define the base function and then use `\cs_generate_variant:Nn` to generate custom variants as described in Section 5.2.

### 4.3.2 Defining new functions using parameter text

---

<code>\cs_new:Npn</code>	<code>\cs_new:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_new:cpn</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_new:Npe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The
<code>\cs_new:cpe</code>	definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.
<code>\cs_new:Npx</code>	
<code>\cs_new:cpx</code>	

---

<code>\cs_new_nopar:Npn</code>	<code>\cs_new_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_new_nopar:cpn</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_new_nopar:Npe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When
<code>\cs_new_nopar:cpe</code>	the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The
<code>\cs_new_nopar:Npx</code>	definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.
<code>\cs_new_nopar:cpx</code>	

---

<code>\cs_new_protected:Npn</code>	<code>\cs_new_protected:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected:cpn</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_new_protected:Npe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The
<code>\cs_new_protected:cpe</code>	<code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The definition is
<code>\cs_new_protected:Npx</code>	global and an error results if the <code>&lt;function&gt;</code> is already defined.
<code>\cs_new_protected:cpx</code>	

---

---

<code>\cs_new_protected_nopar:Npn</code>	<code>\cs_new_protected_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected_nopar:cpn</code>	
<code>\cs_new_protected_nopar:Npe</code>	
<code>\cs_new_protected_nopar:cpe</code>	
<code>\cs_new_protected_nopar:Npx</code>	
<code>\cs_new_protected_nopar:cpX</code>	

---

Creates `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (`#1`, `#2`, etc.) will be replaced by those absorbed by the function. When the `<function>` is used the `<parameters>` absorbed cannot contain `\par` tokens. The `<function>` will not expand within an `e`-type or `x`-type argument. The definition is global and an error results if the `<function>` is already defined.

---

<code>\cs_set:Npn</code>	<code>\cs_set:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_set:cpn</code>	
<code>\cs_set:Npe</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_set:cpe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The
<code>\cs_set:Npx</code>	assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>TeX</code> group level.
<code>\cs_set:cpX</code>	

---

---

<code>\cs_set_nopar:Npn</code>	<code>\cs_set_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_set_nopar:cpn</code>	
<code>\cs_set_nopar:Npe</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_set_nopar:cpe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When
<code>\cs_set_nopar:Npx</code>	the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The
<code>\cs_set_nopar:cpX</code>	assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>TeX</code> group level.

---

---

<code>\cs_set_protected:Npn</code>	<code>\cs_set_protected:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected:cpn</code>	
<code>\cs_set_protected:Npe</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the
<code>\cs_set_protected:cpe</code>	<code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The
<code>\cs_set_protected:Npx</code>	assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>TeX</code> group level.
<code>\cs_set_protected:cpX</code>	The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument.

---

---

<code>\cs_set_protected_nopar:Npn</code>	<code>\cs_set_protected_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected_nopar:cpn</code>	
<code>\cs_set_protected_nopar:Npe</code>	
<code>\cs_set_protected_nopar:cpe</code>	
<code>\cs_set_protected_nopar:Npx</code>	
<code>\cs_set_protected_nopar:cpX</code>	

---

Sets `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (`#1`, `#2`, etc.) will be replaced by those absorbed by the function. When the `<function>` is used the `<parameters>` absorbed cannot contain `\par` tokens. The assignment of a meaning to the `<function>` is restricted to the current `TeX` group level. The `<function>` will not expand within an `e`-type or `x`-type argument.

---

<code>\cs_gset:Npn</code>	<code>\cs_gset:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_gset:cpn</code>	Globally sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the <code>&lt;function&gt;</code> is <i>not</i> restricted to the current TeX group level: the assignment is global.
<code>\cs_gset:Npe</code>	
<code>\cs_gset:cpe</code>	
<code>\cs_gset:Npx</code>	
<code>\cs_gset:cpx</code>	

---

---

<code>\cs_gset_nopar:Npn</code>	<code>\cs_gset_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_gset_nopar:cpn</code>	Globally sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The assignment of a meaning to the <code>&lt;function&gt;</code> is <i>not</i> restricted to the current TeX group level: the assignment is global.
<code>\cs_gset_nopar:Npe</code>	
<code>\cs_gset_nopar:cpe</code>	
<code>\cs_gset_nopar:Npx</code>	
<code>\cs_gset_nopar:cpx</code>	

---

---

<code>\cs_gset_protected:Npn</code>	<code>\cs_gset_protected:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_gset_protected:cpn</code>	Globally sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the <code>&lt;function&gt;</code> is <i>not</i> restricted to the current TeX group level: the assignment is global. The <code>&lt;function&gt;</code> will not expand within an e-type or x-type argument.
<code>\cs_gset_protected:Npe</code>	
<code>\cs_gset_protected:cpe</code>	
<code>\cs_gset_protected:Npx</code>	
<code>\cs_gset_protected:cpx</code>	

---

---

<code>\cs_gset_protected_nopar:Npn</code>	<code>\cs_gset_protected_nopar:Npn &lt;function&gt; &lt;parameters&gt; {&lt;code&gt;}</code>
<code>\cs_gset_protected_nopar:cpn</code>	Globally sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The assignment of a meaning to the <code>&lt;function&gt;</code> is <i>not</i> restricted to the current TeX group level: the assignment is global. The <code>&lt;function&gt;</code> will not expand within an e-type or x-type argument.
<code>\cs_gset_protected_nopar:Npe</code>	
<code>\cs_gset_protected_nopar:cpe</code>	
<code>\cs_gset_protected_nopar:Npx</code>	
<code>\cs_gset_protected_nopar:cpx</code>	

---

Globally sets `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (#1, #2, etc.) will be replaced by those absorbed by the function. When the `<function>` is used the `<parameters>` absorbed cannot contain `\par` tokens. The assignment of a meaning to the `<function>` is *not* restricted to the current TeX group level: the assignment is global. The `<function>` will not expand within an e-type or x-type argument.

### 4.3.3 Defining new functions using the signature

---

<code>\cs_new:Nn</code>	<code>\cs_new:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new:(cn Ne ce)</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. The definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.

---

---

<code>\cs_new_nopar:Nn</code>	<code>\cs_new_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new_nopar:(cn Ne ce)</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.

---

---

<code>\cs_new_protected:Nn</code>	<code>\cs_new_protected:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected:(cn Ne ce)</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.

---

---

<code>\cs_new_protected_nopar:Nn</code>	<code>\cs_new_protected_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected_nopar:(cn Ne ce)</code>	Creates <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The definition is global and an error results if the <code>&lt;function&gt;</code> is already defined.

---

---

<code>\cs_set:Nn</code>	<code>\cs_set:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>T<sub>E</sub>X</code> group level.

---

---

<code>\cs_set_nopar:Nn</code>	<code>\cs_set_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_nopar:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>T<sub>E</sub>X</code> group level.

---

---

<code>\cs_set_protected:Nn</code>	<code>\cs_set_protected:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>T<sub>E</sub>X</code> group level.

---

---

<code>\cs_set_protected_nopar:Nn</code>	<code>\cs_set_protected_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected_nopar:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The assignment of a meaning to the <code>&lt;function&gt;</code> is restricted to the current <code>T<sub>E</sub>X</code> group level.

---

<hr/>	
<code>\cs_gset:Nn</code>	<code>\cs_gset:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_gset:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the <code>&lt;function&gt;</code> is global.
<hr/>	
<code>\cs_gset_nopar:Nn</code>	<code>\cs_gset_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_gset_nopar:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The assignment of a meaning to the <code>&lt;function&gt;</code> is global.
<hr/>	
<code>\cs_gset_protected:Nn</code>	<code>\cs_gset_protected:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_gset_protected:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The assignment of a meaning to the <code>&lt;function&gt;</code> is global.
<hr/>	
<code>\cs_gset_protected_nopar:Nn</code>	<code>\cs_gset_protected_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_gset_protected_nopar:(cn Ne ce)</code>	Sets <code>&lt;function&gt;</code> to expand to <code>&lt;code&gt;</code> as replacement text. Within the <code>&lt;code&gt;</code> , the number of <code>&lt;parameters&gt;</code> is detected automatically from the function signature. These <code>&lt;parameters&gt;</code> ( <code>#1</code> , <code>#2</code> , etc.) will be replaced by those absorbed by the function. When the <code>&lt;function&gt;</code> is used the <code>&lt;parameters&gt;</code> absorbed cannot contain <code>\par</code> tokens. The <code>&lt;function&gt;</code> will not expand within an <code>e</code> -type or <code>x</code> -type argument. The assignment of a meaning to the <code>&lt;function&gt;</code> is global.
<hr/>	
<code>\cs_generate_from_arg_count:NNnn</code>	<code>\cs_generate_from_arg_count:NNnn &lt;function&gt; &lt;creator&gt; {&lt;number&gt;}</code>
<code>\cs_generate_from_arg_count:(NNno cNnn Ncnn)</code>	<code>{&lt;code&gt;}</code>
<hr/>	
	Updated: 2012-01-14

Uses the `<creator>` function (which should have signature `Npn`, for example `\cs_new:Npn`) to define a `<function>` which takes `<number>` arguments and has `<code>` as replacement text. The `<number>` of arguments is an integer expression, evaluated as detailed for `\int_eval:n`.

#### 4.3.4 Copying control sequences

Control sequences (not just functions as defined above) can be set to have the same meaning using the functions described here. Making two control sequences equivalent means that the second control sequence is a *copy* of the first (rather than a pointer to it). Thus the old and new control sequence are not tied together: changes to one are not reflected in the other.

In the following text “cs” is used as an abbreviation for “control sequence”.

---

<code>\cs_new_eq:NN</code>	<code>\cs_new_eq:NN &lt;cs<sub>1</sub>&gt; &lt;cs<sub>2</sub>&gt;</code>
<code>\cs_new_eq:(Nc cN cc)</code>	<code>\cs_new_eq:NN &lt;cs<sub>1</sub>&gt; &lt;token&gt;</code>

---

Globally creates  $\langle \textit{control sequence}_1 \rangle$  and sets it to have the same meaning as  $\langle \textit{control sequence}_2 \rangle$  or  $\langle \textit{token} \rangle$ . The second control sequence may subsequently be altered without affecting the copy.

---

<code>\cs_set_eq:NN</code>	<code>\cs_set_eq:NN &lt;cs<sub>1</sub>&gt; &lt;cs<sub>2</sub>&gt;</code>
<code>\cs_set_eq:(Nc cN cc)</code>	<code>\cs_set_eq:NN &lt;cs<sub>1</sub>&gt; &lt;token&gt;</code>

---

Sets  $\langle \textit{control sequence}_1 \rangle$  to have the same meaning as  $\langle \textit{control sequence}_2 \rangle$  (or  $\langle \textit{token} \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle \textit{control sequence}_1 \rangle$  is restricted to the current T<sub>E</sub>X group level.

---

<code>\cs_gset_eq:NN</code>	<code>\cs_gset_eq:NN &lt;cs<sub>1</sub>&gt; &lt;cs<sub>2</sub>&gt;</code>
<code>\cs_gset_eq:(Nc cN cc)</code>	<code>\cs_gset_eq:NN &lt;cs<sub>1</sub>&gt; &lt;token&gt;</code>

---

Globally sets  $\langle \textit{control sequence}_1 \rangle$  to have the same meaning as  $\langle \textit{control sequence}_2 \rangle$  (or  $\langle \textit{token} \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle \textit{control sequence}_1 \rangle$  is *not* restricted to the current T<sub>E</sub>X group level: the assignment is global.

### 4.3.5 Deleting control sequences

There are occasions where control sequences need to be deleted. This is handled in a very simple manner.

---

<code>\cs_undefine:N</code>	<code>\cs_undefine:N &lt;control sequence&gt;</code>
<code>\cs_undefine:c</code>	Sets $\langle \textit{control sequence} \rangle$ to be globally undefined.

---

Updated: 2011-09-15

---

### 4.3.6 Showing control sequences

---

<code>\cs_meaning:N *</code>	<code>\cs_meaning:N &lt;control sequence&gt;</code>
<code>\cs_meaning:c *</code>	This function expands to the <i>meaning</i> of the $\langle \textit{control sequence} \rangle$ control sequence. For a macro, this includes the $\langle \textit{replacement text} \rangle$ .

---

Updated: 2011-12-22

---

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\meaning`. For tokens that are not control sequences, it is more logical to use `\token_to_meaning:N`. The `c` variant correctly reports undefined arguments.

---

<code>\cs_show:N</code>	<code>\cs_show:N &lt;control sequence&gt;</code>
<code>\cs_show:c</code>	Displays the definition of the $\langle \textit{control sequence} \rangle$ on the terminal.

---

Updated: 2017-02-14

---

**T<sub>E</sub>Xhackers note:** This is similar to the T<sub>E</sub>X primitive `\show`, wrapped to a fixed number of characters per line.

---

<code>\cs_log:N</code>	<code>\cs_log:N &lt;control sequence&gt;</code>
<code>\cs_log:c</code>	Writes the definition of the <code>&lt;control sequence&gt;</code> in the log file. See also <code>\cs_show:N</code> which displays the result in the terminal.

### 4.3.7 Converting to and from control sequences

---

`\use:c` ★ `\use:c {<control sequence name>}`

---

Expands the `<control sequence name>` until only characters remain, and then converts this into a control sequence. This process requires two expansions. As in other `c`-type arguments the `<control sequence name>` must, when fully expanded, consist of character tokens, typically a mixture of category code 10 (space), 11 (letter) and 12 (other).

As an example of the `\use:c` function, both

```
\use:c { a b c }
```

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\use:c { \tl_use:N \l_my_tl }
```

would be equivalent to

```
\abc
```

after two expansions of `\use:c`.

---

<code>\cs_if_exist_use:N</code>	★ <code>\cs_if_exist_use:N &lt;control sequence&gt;</code>
<code>\cs_if_exist_use:c</code>	★ <code>\cs_if_exist_use:NTF &lt;control sequence&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\cs_if_exist_use:NTF</code>	★ Tests whether the <code>&lt;control sequence&gt;</code> is currently defined according to the conditional
<code>\cs_if_exist_use:cTF</code>	★ <code>\cs_if_exist:NTF</code> (whether as a function or another control sequence type), and if it
New: 2012-11-10	is inserts the <code>&lt;control sequence&gt;</code> into the input stream followed by the <code>&lt;true code&gt;</code> . Otherwise the <code>&lt;false code&gt;</code> is used.

---

---

`\cs:w` ★ `\cs:w <control sequence name> \cs_end:`

---

`\cs_end:` ★ Converts the given `<control sequence name>` into a single control sequence token. This process requires one expansion. The content for `<control sequence name>` may be literal material or from other expandable functions. The `<control sequence name>` must, when fully expanded, consist of character tokens which are not active: typically of category code 10 (space), 11 (letter) or 12 (other), or a mixture of these.

**TeXhackers note:** These are the TeX primitives `\csname` and `\endcsname`.

As an example of the `\cs:w` and `\cs_end:` functions, both

```
\cs:w a b c \cs_end:
```

and

```

\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\cs:w \tl_use:N \l_my_tl \cs_end:

```

would be equivalent to

```
\abc
```

after one expansion of `\cs:w`.

---

```
\cs_to_str:N ★ \cs_to_str:N <control sequence>
```

---

Converts the given *<control sequence>* into a series of characters with category code 12 (other), except spaces, of category code 10. The result does *not* include the current escape token, contrarily to `\token_to_str:N`. Full expansion of this function requires exactly 2 expansion steps, and so an *e*-type or *x*-type expansion, or two *o*-type expansions are required to convert the *<control sequence>* to a sequence of characters in the input stream. In most cases, an *f*-expansion is correct as well, but this loses a space at the start of the result.

## 4.4 Analysing control sequences

---

```
\cs_split_function:N ★ \cs_split_function:N <function>
```

---

New: 2018-04-06

Splits the *<function>* into the *<name>* (i.e., the part before the colon) and the *<signature>* (i.e., after the colon). This information is then placed in the input stream in three parts: the *<name>*, the *<signature>* and a logic token indicating if a colon was found (to differentiate variables from function names). The *<name>* does not include the escape character, and both the *<name>* and *<signature>* are made up of tokens with category code 12 (other).

The next three functions decompose  $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  macros into their constituent parts: if the *<token>* passed is not a macro then no decomposition can occur. In the latter case, all three functions leave `\scan_stop:` in the input stream.

---

```
\cs_prefix_spec:N ★ \cs_prefix_spec:N <token>
```

---

New: 2019-02-27

If the *<token>* is a macro, this function leaves the applicable  $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  prefixes in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example

```

\cs_set:Npn \next:nn #1#2 { x #1~y #2 }
\cs_prefix_spec:N \next:nn

```

leaves `\long` in the input stream. If the *<token>* is not a macro then `\scan_stop:` is left in the input stream.

**$\mathrm{T}_{\mathrm{E}}\mathrm{X}$ hackers note:** The prefix can be empty, `\long`, `\protected` or `\protected\long` with backslash replaced by the current escape character.

---

<code>\cs_parameter_spec:N</code> ★	<code>\cs_parameter_spec:N</code> $\langle token \rangle$
-------------------------------------	---

---

New: 2022-06-24

If the  $\langle token \rangle$  is a macro, this function leaves the primitive TeX parameter specification in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

```
\cs_set:Npn \next:nn #1#2 { x #1 y #2 }
\cs_parameter_spec:N \next:nn
```

leaves `#1#2` in the input stream. If the  $\langle token \rangle$  is not a macro then `\scan_stop:` is left in the input stream.

**TeXhackers note:** If the parameter specification contains the string `->`, then the function produces incorrect results.

---

<code>\cs_replacement_spec:N</code> ★	<code>\cs_replacement_spec:N</code> $\langle token \rangle$
---------------------------------------	---

---

<code>\cs_replacement_spec:c</code> ★
---------------------------------------

New: 2019-02-27

If the  $\langle token \rangle$  is a macro, this function leaves the replacement text in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

```
\cs_set:Npn \next:nn #1#2 { x #1~y #2 }
\cs_replacement_spec:N \next:nn
```

leaves `x#1~y#2` in the input stream. If the  $\langle token \rangle$  is not a macro then `\scan_stop:` is left in the input stream.

**TeXhackers note:** If the parameter specification contains the string `->`, then the function produces incorrect results.

## 4.5 Using or removing tokens and arguments

Tokens in the input can be read and used or read and discarded. If one or more tokens are wrapped in braces then when absorbing them the outer set is removed. At the same time, the category code of each token is set when the token is read by a function (if it is read more than once, the category code is determined by the situation in force when first function absorbs the token).

---

<code>\use:n</code>	<code>*</code>	<code>\use:n</code>	<code>{\group_1}</code>
<code>\use:nn</code>	<code>*</code>	<code>\use:nn</code>	<code>{\group_1}</code> <code>{\group_2}</code>
<code>\use:nnn</code>	<code>*</code>	<code>\use:nnn</code>	<code>{\group_1}</code> <code>{\group_2}</code> <code>{\group_3}</code>
<code>\use:nnnn</code>	<code>*</code>	<code>\use:nnnn</code>	<code>{\group_1}</code> <code>{\group_2}</code> <code>{\group_3}</code> <code>{\group_4}</code>

---

As illustrated, these functions absorb between one and four arguments, as indicated by the argument specifier. The braces surrounding each argument are removed and the remaining tokens are left in the input stream. The category code of these tokens is also fixed by this process (if it has not already been by some other absorption). All of these functions require only a single expansion to operate, so that one expansion of

`\use:nn { abc } { { def } }`

results in the input stream containing

`abc { def }`

i.e. only the outer braces are removed.

**TeXhackers note:** The `\use:n` function is equivalent to L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s `\@firstofone`.

---

<code>\use_i:nn</code>	<code>* \use_i:nn {⟨arg₁⟩} {⟨arg₂⟩}</code>
<code>\use_ii:nn</code>	<code>* \use_i:nnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩}</code>
<code>\use_i:nnn</code>	<code>* \use_i:nnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩}</code>
<code>\use_iii:nnn</code>	<code>* \use_i:nnnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩} {⟨arg₅⟩}</code>
<code>\use_iiii:nnn</code>	<code>* \use_i:nnnnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩} {⟨arg₅⟩} {⟨arg₆⟩}</code>
<code>\use_i:nnnn</code>	<code>* \use_i:nnnnnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩} {⟨arg₅⟩} {⟨arg₆⟩} {⟨arg₇⟩}</code>
<code>\use_ii:nnnn</code>	<code>* \use_i:nnnnnnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩} {⟨arg₅⟩} {⟨arg₆⟩} {⟨arg₇⟩}</code>
<code>\use_iii:nnnn</code>	<code>* {⟨arg₈⟩}</code>
<code>\use_iv:nnnn</code>	<code>* \use_i:nnnnnnnnn {⟨arg₁⟩} {⟨arg₂⟩} {⟨arg₃⟩} {⟨arg₄⟩} {⟨arg₅⟩} {⟨arg₆⟩} {⟨arg₇⟩}</code>
<code>\use_i:nnnnn</code>	<code>* {⟨arg₈⟩} {⟨arg₉⟩}</code>
<code>\use_ii:nnnnn</code>	<code>*</code>
<code>\use_iii:nnnnn</code>	<code>*</code>
<code>\use_iv:nnnnn</code>	<code>*</code>
<code>\use_v:nnnnn</code>	<code>*</code>
<code>\use_i:nnnnnn</code>	<code>*</code>
<code>\use_ii:nnnnnn</code>	<code>*</code>
<code>\use_iii:nnnnnn</code>	<code>*</code>
<code>\use_iv:nnnnnn</code>	<code>*</code>
<code>\use_v:nnnnnn</code>	<code>*</code>
<code>\use_vi:nnnnnn</code>	<code>*</code>
<code>\use_i:nnnnnnn</code>	<code>*</code>
<code>\use_ii:nnnnnnn</code>	<code>*</code>
<code>\use_iii:nnnnnnn</code>	<code>*</code>
<code>\use_iv:nnnnnnn</code>	<code>*</code>
<code>\use_v:nnnnnnn</code>	<code>*</code>
<code>\use_vi:nnnnnnn</code>	<code>*</code>
<code>\use_vii:nnnnnnn</code>	<code>*</code>
<code>\use_i:nnnnnnnn</code>	<code>*</code>
<code>\use_ii:nnnnnnnn</code>	<code>*</code>
<code>\use_iii:nnnnnnnn</code>	<code>*</code>
<code>\use_iv:nnnnnnnn</code>	<code>*</code>
<code>\use_v:nnnnnnnn</code>	<code>*</code>
<code>\use_vi:nnnnnnnn</code>	<code>*</code>
<code>\use_vii:nnnnnnnn</code>	<code>*</code>
<code>\use_viii:nnnnnnnn</code>	<code>*</code>
<code>\use_i:nnnnnnnnn</code>	<code>*</code>
<code>\use_ii:nnnnnnnnn</code>	<code>*</code>
<code>\use_iii:nnnnnnnnn</code>	<code>*</code>
<code>\use_iv:nnnnnnnnn</code>	<code>*</code>
<code>\use_v:nnnnnnnnn</code>	<code>*</code>
<code>\use_vi:nnnnnnnnn</code>	<code>*</code>
<code>\use_vii:nnnnnnnnn</code>	<code>*</code>
<code>\use_viii:nnnnnnnnn</code>	<code>*</code>
<code>\use_ix:nnnnnnnnn</code>	<code>*</code>

---

These functions absorb a number ( $n$ ) arguments from the input stream. They then discard all arguments other than that indicated by the roman numeral, which is left in the input stream. For example, `\use_i:nn` discards the second argument, and leaves the content of the first argument in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

---

<code>\use_i_ii:nnn</code>	★	<code>\use_i_ii:nnn {⟨arg<sub>1</sub>⟩} {⟨arg<sub>2</sub>⟩} {⟨arg<sub>3</sub>⟩}</code>
----------------------------	---	--

---

This function absorbs three arguments and leaves the content of the first and second in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect. An example:

```
\use_i_ii:nnn { abc } { { def } } { ghi }
```

results in the input stream containing

```
abc { def }
```

i.e. the outer braces are removed and the third group is removed.

---

<code>\use_ii_i:nn</code>	★	<code>\use_ii_i:nn {⟨arg<sub>1</sub>⟩} {⟨arg<sub>2</sub>⟩}</code>
---------------------------	---	---

---

New: 2019-06-02

This function absorbs two arguments and leaves the content of the second and first in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect.

---

<code>\use_none:n</code>	★	<code>\use_none:n {⟨group<sub>1</sub>⟩}</code>
--------------------------	---	--

<code>\use_none:nn</code>	★
---------------------------	---

<code>\use_none:nnn</code>	★
----------------------------	---

<code>\use_none:nnnn</code>	★
-----------------------------	---

<code>\use_none:nnnnn</code>	★
------------------------------	---

<code>\use_none:nnnnnn</code>	★
-------------------------------	---

<code>\use_none:nnnnnnn</code>	★
--------------------------------	---

<code>\use_none:nnnnnnnn</code>	★
---------------------------------	---

<code>\use_none:nnnnnnnnn</code>	★
----------------------------------	---

---

**TeXhackers note:** These are equivalent to L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s `\@gobble`, `\@gobbletwo`, etc.

---

<code>\use:e</code>	★	<code>\use:e {⟨expandable tokens⟩}</code>
---------------------	---	---

---

New: 2018-06-18

Updated: 2023-07-05

Fully expands the `⟨token list⟩` in an `e`-type manner, in which parameter character (usually `#`) need not be doubled, *and* the function remains fully expandable.

**TeXhackers note:** `\use:e` is a wrapper around the primitive `\expanded`. It requires two expansions to complete its action.

#### 4.5.1 Selecting tokens from delimited arguments

A different kind of function for selecting tokens from the token stream are those that use delimited arguments.

---

<code>\use_none_delimit_by_q_nil:w</code>	★	<code>\use_none_delimit_by_q_nil:w ⟨balanced text⟩ \q_nil</code>
<code>\use_none_delimit_by_q_stop:w</code>	★	<code>\use_none_delimit_by_q_stop:w ⟨balanced text⟩ \q_stop</code>
<code>\use_none_delimit_by_q_recursion_stop:w</code>	★	<code>\use_none_delimit_by_q_recursion_stop:w ⟨balanced text⟩ \q_recursion_stop</code>

---

Absorb the `⟨balanced text⟩` from the input stream delimited by the marker given in the function name, leaving nothing in the input stream.

---

<code>\use_i_delimit_by_q_nil:nw</code>	<code>★ \use_i_delimit_by_q_nil:nw {\langle inserted tokens \rangle} \langle balanced text \rangle \q_nil</code>
<code>\use_i_delimit_by_q_stop:nw</code>	<code>★ \use_i_delimit_by_q_stop:nw {\langle inserted tokens \rangle} \langle balanced text \rangle</code>
<code>\use_i_delimit_by_q_recursion_stop:nw</code>	<code>★ \q_stop</code>

---

	<code>\use_i_delimit_by_q_recursion_stop:nw {\langle inserted tokens \rangle} \langle balanced text \rangle \q_recursion_stop</code>
--	--

Absorb the  $\langle balanced\ text \rangle$  from the input stream delimited by the marker given in the function name, leaving  $\langle inserted\ tokens \rangle$  in the input stream for further processing.

## 4.6 Predicates and conditionals

L<sup>A</sup>T<sub>E</sub>X3 has three concepts for conditional flow processing:

**Branching conditionals** Functions that carry out a test and then execute, depending on its result, either the code supplied as the  $\langle true\ code \rangle$  or the  $\langle false\ code \rangle$ . These arguments are denoted with T and F, respectively. An example would be

```
\cs_if_free:cTF {abc} {\langle true code \rangle} {\langle false code \rangle}
```

a function that turns the first argument into a control sequence (since it’s marked as c) then checks whether this control sequence is still free and then depending on the result carries out the code in the second argument (true case) or in the third argument (false case).

These type of functions are known as “conditionals”; whenever a TF function is defined it is usually accompanied by T and F functions as well. These are provided for convenience when the branch only needs to go a single way. Package writers are free to choose which types to define but the kernel definitions always provide all three versions.

Important to note is that these branching conditionals with  $\langle true\ code \rangle$  and/or  $\langle false\ code \rangle$  are always defined in a way that the code of the chosen alternative can operate on following tokens in the input stream.

These conditional functions may or may not be fully expandable, but if they are expandable they are accompanied by a “predicate” for the same test as described below.

**Predicates** “Predicates” are functions that return a special type of boolean value which can be tested by the boolean expression parser. All functions of this type are expandable and have names that end with `_p` in the description part. For example,

```
\cs_if_free_p:N
```

would be a predicate function for the same type of test as the conditional described above. It would return “true” if its argument (a single token denoted by N) is still free for definition. It would be used in constructions like

```
\bool_if:nTF
{ \cs_if_free_p:N \l_tmpz_tl || \cs_if_free_p:N \g_tmpz_tl }
{\langle true code \rangle} {\langle false code \rangle}
```

For each predicate defined, a “branching conditional” also exists that behaves like a conditional described above.

**Primitive conditionals** There is a third variety of conditional, which is the original concept used in plain  $\text{T}_{\text{E}}\text{X}$  and  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X } 2_{\epsilon}$ . Their use is discouraged in `expl3` (although still used in low-level definitions) because they are more fragile and in many cases require more expansion control (hence more code) than the two types of conditionals described above.

### 4.6.1 Tests on control sequences

---

<code>\cs_if_eq_p:NN</code>	$\star$ <code>\cs_if_eq_p:NN</code> $\langle cs_1 \rangle$ $\langle cs_2 \rangle$
<code>\cs_if_eq_p:(Nc cN cc)</code>	$\star$ <code>\cs_if_eq:NNTF</code> $\langle cs_1 \rangle$ $\langle cs_2 \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\cs_if_eq:NNTF</code>	$\star$ Compares the definition of two $\langle control\ sequences \rangle$ and is logically <code>true</code> if they are
<code>\cs_if_eq:(Nc cN cc)TF</code>	$\star$ the same, i.e., if they have exactly the same definition when examined with <code>\cs_show:N</code> .

---

---

<code>\cs_if_exist_p:N</code>	$\star$ <code>\cs_if_exist_p:N</code> $\langle control\ sequence \rangle$
<code>\cs_if_exist_p:c</code>	$\star$ <code>\cs_if_exist:NNTF</code> $\langle control\ sequence \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\cs_if_exist:NNTF</code>	$\star$ Tests whether the $\langle control\ sequence \rangle$ is currently defined (whether as a function or
<code>\cs_if_exist:cTF</code>	$\star$ another control sequence type), and its meaning is not the primitive <code>\relax</code> token. This
	is different from <code>\if_cs_exist:N</code> , which evaluates to <code>true</code> if passed the token <code>\relax</code> as an argument.

---

---

<code>\cs_if_free_p:N</code>	$\star$ <code>\cs_if_free_p:N</code> $\langle control\ sequence \rangle$
<code>\cs_if_free_p:c</code>	$\star$ <code>\cs_if_free:NNTF</code> $\langle control\ sequence \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\cs_if_free:NNTF</code>	$\star$ This test is the negation of the above <code>\cs_if_exist:NNTF</code> .
<code>\cs_if_free:cTF</code>	$\star$

---

### 4.6.2 Primitive conditionals

The  $\epsilon$ - $\text{T}_{\text{E}}\text{X}$  engine itself provides many different conditionals. Some expand whatever comes after them and others don't. Hence the names for these underlying functions often contains a `:w` part but higher level functions are often available. See for instance `\int_compare_p:nNn` which is a wrapper for `\if_int_compare:w`.

Certain conditionals deal with specific data types like boxes and fonts and are described there. The ones described below are either the universal conditionals or deal with control sequences. We prefix primitive conditionals with `\if_`, except for `\if:w`.

---

<code>\if_true:</code>	$\star$ <code>\if_true:</code> $\langle true\ code \rangle$ <code>\else:</code> $\langle false\ code \rangle$ <code>\fi:</code>
<code>\if_false:</code>	$\star$ <code>\if_false:</code> $\langle true\ code \rangle$ <code>\else:</code> $\langle false\ code \rangle$ <code>\fi:</code>
<code>\else:</code>	$\star$ <code>\reverse_if:N</code> $\langle primitive\ conditional \rangle$
<code>\fi:</code>	$\star$ <code>\if_true:</code> always executes $\langle true\ code \rangle$ , while <code>\if_false:</code> always executes $\langle false\ code \rangle$ .
<code>\reverse_if:N</code>	$\star$ <code>\reverse_if:N</code> reverses any two-way primitive conditional. <code>\else:</code> and <code>\fi:</code> delimit the branches of the conditional. The function <code>\or:</code> is documented in <code>l3int</code> and used in case switches.

---

**$\text{T}_{\text{E}}\text{X}$ hackers note:** `\if_true:` and `\if_false:` are equivalent to their corresponding  $\text{T}_{\text{E}}\text{X}$  primitive conditionals `\iftrue` and `\iffalse`; `\else:` and `\fi:` are the  $\text{T}_{\text{E}}\text{X}$  primitives `\else` and `\fi`; `\reverse_if:N` is the  $\epsilon$ - $\text{T}_{\text{E}}\text{X}$  primitive `\unless`.

---

`\if_meaning:w` ★ `\if_meaning:w <arg1> <arg2> <true code> \else: <false code> \fi:`

---

`\if_meaning:w` executes `<true code>` when `<arg1>` and `<arg2>` are the same, otherwise it executes `<false code>`. `<arg1>` and `<arg2>` could be functions, variables, tokens; in all cases the *unexpanded* definitions are compared.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifx`.

---

`\if:w` ★ `\if:w <token(s)> <true code> \else: <false code> \fi:`

`\if_charcode:w` ★ `\if_catcode:w <token(s)> <true code> \else: <false code> \fi:`

---

`\if_catcode:w` ★ `\if_charcode:w` is an alternative name for `\if:w`. These conditionals expand `<token(s)>` until two unexpandable tokens `<token1>` and `<token2>` are found; any further tokens up to the next unbalanced `\else:` are the true branch, ending with `<true code>`. It is executed if the condition is fulfilled, otherwise `<false code>` is executed. You can omit `\else:` when just in front of `\fi:` and you can nest `\if... \else:... \fi:` constructs inside the true branch or the `<false code>`. With `\exp_not:N`, you can prevent the expansion of a token.

`\if_catcode:w` tests if `<token1>` and `<token2>` have the same category code whereas `\if:w` and `\if_charcode:w` test if they have the same character code.

**T<sub>E</sub>Xhackers note:** `\if:w` and `\if_charcode:w` are both the T<sub>E</sub>X primitive `\if`. `\if_catcode:w` is the T<sub>E</sub>X primitive `\ifcat`.

---

`\if_cs_exist:N` ★ `\if_cs_exist:N <cs> <true code> \else: <false code> \fi:`

`\if_cs_exist:w` ★ `\if_cs_exist:w <tokens> \cs_end: <true code> \else: <false code> \fi:`

---

Check if `<cs>` appears in the hash table or if the control sequence that can be formed from `<tokens>` appears in the hash table. The latter function does not turn the control sequence in question into the primitive `\relax` token. This can be useful when dealing with control sequences which cannot be entered as a single token.

**T<sub>E</sub>Xhackers note:** These are the T<sub>E</sub>X primitives `\ifdefined` and `\ifcsname`.

---

`\if_mode_horizontal:` ★ `\if_mode_horizontal: <true code> \else: <false code> \fi:`

`\if_mode_vertical:` ★ Execute `<true code>` if currently in horizontal mode, otherwise execute `<false code>`.

`\if_mode_math:` ★ Similar for the other functions.

`\if_mode_inner:` ★

---

**T<sub>E</sub>Xhackers note:** These are the T<sub>E</sub>X primitives `\ifhmode`, `\ifvmode`, `\ifmmode`, and `\ifinner`.

## 4.7 Starting a paragraph

---

<code>\mode_leave_vertical:</code>	<code>\mode_leave_vertical:</code>
------------------------------------	------------------------------------

---

New: 2017-07-04

Ensures that `\TeX` is not in vertical (inter-paragraph) mode. In horizontal or math mode this command has no effect, in vertical mode it switches to horizontal mode, and inserts a box of width `\parindent`, followed by the `\everypar` token list.

**`\TeX`hackers note:** This results in the contents of the `\everypar` token register being inserted, after `\mode_leave_vertical:` is complete. Notice that in contrast to the `\LaTeX 2ε` `\leavevmode` approach, no box is used by the method implemented here.

## 4.8 Debugging support

---

<code>\debug_on:n</code>	<code>\debug_on:n {&lt;comma-separated list&gt;}</code>
<code>\debug_off:n</code>	<code>\debug_off:n {&lt;comma-separated list&gt;}</code>

---

New: 2017-07-16  
Updated: 2023-05-23

Turn on and off within a group various debugging code, some of which is also available as `expl3` load-time options. The items that can be used in the `<list>` are

- **check-declarations** that checks all `expl3` variables used were previously declared and that local/global variables (based on their name or on their first assignment) are only locally/globally assigned;
- **check-expressions** that checks integer, dimension, skip, and muskip expressions are not terminated prematurely;
- **deprecation** that makes deprecated commands produce errors;
- **log-functions** that logs function definitions and variable declarations;
- **all** that does all of the above.

Providing these as switches rather than options allows testing code even if it relies on other packages: load all other packages, call `\debug_on:n`, and load the code that one is interested in testing.

---

<code>\debug_suspend:</code>	<code>\debug_suspend: ... \debug_resume:</code>
<code>\debug_resume:</code>	

---

New: 2017-11-28

Suppress (locally) errors and logging from `debug` commands, except for the **deprecation** errors. These pairs of commands can be nested. This can be used around pieces of code that are known to fail checks, if such failures should be ignored. See for instance `l3cctab` and `l3coffins`.

## Chapter 5

# The l3expan module

## Argument expansion

This module provides generic methods for expanding  $\TeX$  arguments in a systematic manner. The functions in this module all have prefix `exp`.

Not all possible variations are implemented for every base function. Instead only those that are used within the  $\LaTeX$ 3 kernel or otherwise seem to be of general interest are implemented. Consult the module description to find out which functions are actually defined. The next section explains how to define missing variants.

### 5.1 Defining new variants

The definition of variant forms for base functions may be necessary when writing new functions or when applying a kernel function in a situation that we haven't thought of before.

Internally preprocessing of arguments is done with functions of the form `\exp_....`. They all look alike, an example would be `\exp_args:NNo`. This function has three arguments, the first and the second are a single tokens, while the third argument should be given in braces. Applying `\exp_args:NNo` expands the content of third argument once before any expansion of the first and second arguments. If `\seq_gpush:No` was not defined it could be coded in the following way:

```
\exp_args:NNo \seq_gpush:Nn
  \g_file_name_stack
  { \l_tmpa_tl }
```

In other words, the first argument to `\exp_args:NNo` is the base function and the other arguments are preprocessed and then passed to this base function. In the example the first argument to the base function should be a single token which is left unchanged while the second argument is expanded once. From this example we can also see how the variants are defined. They just expand into the appropriate `\exp_` function followed by the desired base function, *e.g.*

```
\cs_generate_variant:Nn \seq_gpush:Nn { No }
```

results in the definition of `\seq_gpush:No`

```
\cs_new:Npn \seq_gpush:No { \exp_args:NNo \seq_gpush:Nn }
```

Providing variants in this way in style files is safe as the `\cs_generate_variant:Nn` function will only create new definitions if there is not already one available. Therefore adding such definition to later releases of the kernel will not make such style files obsolete.

The steps above may be automated by using the function `\cs_generate_variant:Nn`, described next.

## 5.2 Methods for defining variants

We recall the set of available argument specifiers.

- `N` is used for single-token arguments while `c` constructs a control sequence from its name and passes it to a parent function as an `N`-type argument.
- Many argument types extract or expand some tokens and provide it as an `n`-type argument, namely a braced multiple-token argument: `V` extracts the value of a variable, `v` extracts the value from the name of a variable, `n` uses the argument as it is, `o` expands once, `f` expands fully the front of the token list, `e` and `x` expand fully all tokens (differences are explained later).
- A few odd argument types remain: `T` and `F` for conditional processing, otherwise identical to `n`-type arguments, `p` for the parameter text in definitions, `w` for arguments with a specific syntax, and `D` to denote primitives that should not be used directly.

---

<code>\cs_generate_variant:Nn</code> <code>\cs_generate_variant:cn</code>	<code>\cs_generate_variant:Nn &lt;parent control sequence&gt; {&lt;variant argument specifiers&gt;}</code>
--	--

---

Updated: 2017-11-28

This function is used to define argument-specifier variants of the `<parent control sequence>` for L<sup>A</sup>T<sub>E</sub>X3 code-level macros. The `<parent control sequence>` is first separated into the `<base name>` and `<original argument specifier>`. The comma-separated list of `<variant argument specifiers>` is then used to define variants of the `<original argument specifier>` if these are not already defined; entries which correspond to existing functions are silently ignored. For each `<variant>` given, a function is created that expands its arguments as detailed and passes them to the `<parent control sequence>`. So for example

```
\cs_set:Npn \foo:Nn #1#2 { code here }
\cs_generate_variant:Nn \foo:Nn { c }
```

creates a new function `\foo:cn` which expands its first argument into a control sequence name and passes the result to `\foo:Nn`. Similarly

```
\cs_generate_variant:Nn \foo:Nn { NV , cV }
```

generates the functions `\foo:NV` and `\foo:cV` in the same way. The `\cs_generate_variant:Nn` function should only be applied if the `<parent control sequence>` is already defined. (This is only enforced if debugging support `check-declarations` is enabled.) If the `<parent control sequence>` is protected or if the `<variant>` involves any `x` argument, then the `<variant control sequence>` is also protected. The `<variant>` is created globally, as is any `\exp_args:N<variant>` function needed to carry out the expansion. There is no need to re-apply `\cs_generate_variant:Nn` after changing the definition of the parent function: the variant will always use the current definition of the parent. Providing variants repeatedly is safe as `\cs_generate_variant:Nn` will only create new definitions if there is not already one available.

Only `n` and `N` arguments can be changed to other types. The only allowed changes are

- `c` variant of an `N` parent;
- `o`, `V`, `v`, `f`, `e`, or `x` variant of an `n` parent;
- `N`, `n`, `T`, `F`, or `p` argument unchanged.

This means the `<parent>` of a `<variant>` form is always unambiguous, even in cases where both an `n`-type parent and an `N`-type parent exist, such as for `\tl_count:n` and `\tl_count:N`.

When creating variants for conditional functions, `\prg_generate_conditional_variant:Nnn` provides a convenient way of handling the related function set.

For backward compatibility it is currently possible to make `n`, `o`, `V`, `v`, `f`, `e`, or `x`-type variants of an `N`-type argument or `N` or `c`-type variants of an `n`-type argument. Both are deprecated. The first because passing more than one token to an `N`-type argument will typically break the parent function's code. The second because programmers who use that most often want to access the value of a variable given its name, hence should use a `V`-type or `v`-type variant instead of `c`-type. In those cases, using the lower-level `\exp_args:No` or `\exp_args:Nc` functions explicitly is preferred to defining confusing variants.

<code>\exp_args_generate:n</code>	<code>\exp_args_generate:n {&lt;variant argument specifiers&gt;}</code>
New: 2018-04-04	Defines <code>\exp_args:N&lt;variant&gt;</code> functions for each <code>&lt;variant&gt;</code> given in the comma list <code>{&lt;variant argument specifiers&gt;}</code> . Each <code>&lt;variant&gt;</code> should consist of the letters N, c, n, V, v, o, f, e, x, p and the resulting function is protected if the letter x appears in the <code>&lt;variant&gt;</code> . This is only useful for cases where <code>\cs_generate_variant:Nn</code> is not applicable.
Updated: 2019-02-08	

### 5.3 Introducing the variants

The `V` type returns the value of a register, which can be one of `tl`, `clist`, `int`, `skip`, `dim`, `muskip`, or built-in `TEX` registers. The `v` type is the same except it first creates a control sequence out of its argument before returning the value.

In general, the programmer should not need to be concerned with expansion control. When simply using the content of a variable, functions with a `V` specifier should be used. For those referred to by `(cs)name`, the `v` specifier is available for the same purpose. Only when specific expansion steps are needed, such as when using delimited arguments, should the lower-level functions with `o` specifiers be employed.

The `e` type expands all tokens fully, starting from the first. More precisely the expansion is identical to that of `TEX`'s `\message` (in particular `#` needs not be doubled). It relies on the primitive `\expanded` hence is fast.

The `x` type expands all tokens fully, starting from the first. In contrast to `e`, all macro parameter characters `#` must be doubled, and omitting this leads to low-level errors. In addition this type of expansion is not expandable, namely functions that have `x` in their signature do not themselves expand when appearing inside `e` or `x` expansion.

The `f` type is so special that it deserves an example. It is typically used in contexts where only expandable commands are allowed. Then `x`-expansion cannot be used, and `f`-expansion provides an alternative that expands the front of the token list as much as can be done in such contexts. For instance, say that we want to evaluate the integer expression `3 + 4` and pass the result 7 as an argument to an expandable function `\example:n`. For this, one should define a variant using `\cs_generate_variant:Nn \example:n { f }`, then do

```
\example:f { \int_eval:n { 3 + 4 } }
```

Note that `x`-expansion would also expand `\int_eval:n` fully to its result 7, but the variant `\example:x` cannot be expandable. Note also that `o`-expansion would not expand `\int_eval:n` fully to its result since that function requires several expansions. Besides the fact that `x`-expansion is protected rather than expandable, another difference between `f`-expansion and `x`-expansion is that `f`-expansion expands tokens from the beginning and stops as soon as a non-expandable token is encountered, while `x`-expansion continues expanding further tokens. Thus, for instance

```
\example:f { \int_eval:n { 1 + 2 } , \int_eval:n { 3 + 4 } }
```

results in the call

```
\example:n { 3 , \int_eval:n { 3 + 4 } }
```

while using `\example:x` or `\example:e` instead results in

```
\example:n { 3 , 7 }
```

at the cost of being protected for x-type. If you use **f** type expansion in conditional processing then you should stick to using TF type functions only as the expansion does not finish any `\if... \fi`: itself!

It is important to note that both **f**- and **o**-type expansion are concerned with the expansion of tokens from left to right in their arguments. In particular, **o**-type expansion applies to the first *token* in the argument it receives: it is conceptually similar to

```
\exp_after:wN <base function> \exp_after:wN { <argument> }
```

At the same time, **f**-type expansion stops at the *first* non-expandable token. This means for example that both

```
\tl_set:No \l_tmpa_tl { { \g_tmpb_tl } }
```

and

```
\tl_set:Nf \l_tmpa_tl { { \g_tmpb_tl } }
```

leave `\g_tmpb_tl` unchanged: `{` is the first token in the argument and is non-expandable.

It is usually best to keep the following in mind when using variant forms.

- Variants with **x**-type arguments (that are fully expanded before being passed to the **n**-type base function) are never expandable even when the base function is. Such variants cannot work correctly in arguments that are themselves subject to expansion. Consider using **f** or **e** expansion.
- In contrast, **e** expansion (full expansion, almost like **x** except for the treatment of `#`) does not prevent variants from being expandable (if the base function is).
- Finally **f** expansion only expands the front of the token list, stopping at the first non-expandable token. This may fail to fully expand the argument.

When speed is essential (for functions that do very little work and whose variants are used numerous times in a document) the following considerations apply because the speed of internal functions that expand the arguments of a base function depend on what needs doing with each argument and where this happens in the list of arguments:

- for fastest processing any **c**-type arguments should come first followed by all other modified arguments;
- unchanged **N**-type args that appear before modified ones have a small performance hit;
- unchanged **n**-type args that appear before modified ones have a relative larger performance hit.

## 5.4 Manipulating the first argument

These functions are described in detail: expansion of multiple tokens follows the same rules but is described in a shorter fashion.

<hr/>	<hr/>	<code>\exp_args:Nc</code> *	<code>\exp_args:Nc &lt;function&gt; {&lt;tokens&gt;}</code>
<hr/>		<code>\exp_args:cc</code> *	<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>). The <code>&lt;tokens&gt;</code> are expanded until only characters remain, and are then turned into a control sequence. The result is inserted into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p> <p>The <code>:cc</code> variant constructs the <code>&lt;function&gt;</code> name in the same manner as described for the <code>&lt;tokens&gt;</code>.</p>
<hr/>		<code>\exp_args:No</code> *	<code>\exp_args:No &lt;function&gt; {&lt;tokens&gt;} ...</code>
<hr/>			<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>). The <code>&lt;tokens&gt;</code> are expanded once, and the result is inserted in braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>
<hr/>		<code>\exp_args:Nv</code> *	<code>\exp_args:Nv &lt;function&gt; &lt;variable&gt;</code>
<hr/>			<p>This function absorbs two arguments (the names of the <code>&lt;function&gt;</code> and the <code>&lt;variable&gt;</code>). The content of the <code>&lt;variable&gt;</code> are recovered and placed inside braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>
<hr/>		<code>\exp_args:Nv</code> *	<code>\exp_args:Nv &lt;function&gt; {&lt;tokens&gt;}</code>
<hr/>			<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>). The <code>&lt;tokens&gt;</code> are expanded until only characters remain, and are then turned into a control sequence. This control sequence should be the name of a <code>&lt;variable&gt;</code>. The content of the <code>&lt;variable&gt;</code> are recovered and placed inside braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>
<hr/>		<code>\exp_args:Ne</code> *	<code>\exp_args:Ne &lt;function&gt; {&lt;tokens&gt;}</code>
<hr/>	New: 2018-05-15		<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>) and exhaustively expands the <code>&lt;tokens&gt;</code>. The result is inserted in braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>
<hr/>		<code>\exp_args:Nf</code> *	<code>\exp_args:Nf &lt;function&gt; {&lt;tokens&gt;}</code>
<hr/>			<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>). The <code>&lt;tokens&gt;</code> are fully expanded until the first non-expandable token is found (if that is a space it is removed), and the result is inserted in braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>
<hr/>		<code>\exp_args:Nx</code>	<code>\exp_args:Nx &lt;function&gt; {&lt;tokens&gt;}</code>
<hr/>			<p>This function absorbs two arguments (the <code>&lt;function&gt;</code> name and the <code>&lt;tokens&gt;</code>) and exhaustively expands the <code>&lt;tokens&gt;</code>. The result is inserted in braces into the input stream <i>after</i> reinsertion of the <code>&lt;function&gt;</code>. Thus the <code>&lt;function&gt;</code> may take more than one argument: all others are left unchanged.</p>

Updated: 2018-05-15

---

---

<code>\exp_last_unbraced:Nx</code>	<code>\exp_last_unbraced:Nx</code>	<code>\langle function \rangle \{\langle tokens \rangle\}</code>
------------------------------------	------------------------------------	--

---

This function fully expands the `\langle tokens \rangle` and leaves the result in the input stream after reinsertion of the `\langle function \rangle`. This function is not expandable.

---

<code>\exp_last_two_unbraced:Noo</code>	*	<code>\exp_last_two_unbraced:Noo</code>	<code>\langle token \rangle \{\langle tokens_1 \rangle\} \{\langle tokens_2 \rangle\}</code>
---	---	---	--

---

This function absorbs three arguments and expands the second and third once. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments, which are not wrapped in braces. This function needs special (slower) processing.

---

`\exp_after:wN` ★ `\exp_after:wN`  $\langle token_1 \rangle$   $\langle token_2 \rangle$

---

Carries out a single expansion of  $\langle token_2 \rangle$  (which may consume arguments) prior to the expansion of  $\langle token_1 \rangle$ . If  $\langle token_2 \rangle$  has no expansion (for example, if it is a character) then it is left unchanged. It is important to notice that  $\langle token_1 \rangle$  may be *any* single token, including group-opening and -closing tokens (`{` or `}` assuming normal  $\text{\TeX}$  category codes). Unless specifically required this should be avoided: expansion should be carried out using an appropriate argument specifier variant or the appropriate `\exp_args:N`(*variant*) function.

**$\text{\TeX}$ hackers note:** This is the  $\text{\TeX}$  primitive `\expandafter`.

## 5.8 Preventing expansion

Despite the fact that the following functions are all about preventing expansion, they're designed to be used in an expandable context and hence are all marked as being 'expandable' since they themselves disappear after the expansion has completed.

---

`\exp_not:N` ★ `\exp_not:N`  $\langle token \rangle$

---

Prevents expansion of the  $\langle token \rangle$  in a context where it would otherwise be expanded, for example an **e**-type or **x**-type argument or the first token in an **o**-type or **f**-type argument.

**$\text{\TeX}$ hackers note:** This is the  $\text{\TeX}$  primitive `\noexpand`. It only prevents expansion. At the beginning of an **f**-type argument, a space  $\langle token \rangle$  is removed even if it appears as `\exp_not:N` `\c_space_token`. In an **e**-expanding definition (`\cs_new:Npe`), a macro parameter introduces an argument even if it appears as `\exp_not:N` `#1`. This differs from `\exp_not:n`.

---

`\exp_not:c` ★ `\exp_not:c`  $\{\langle tokens \rangle\}$

---

Expands the  $\langle tokens \rangle$  until only characters remain, and then converts this into a control sequence. Further expansion of this control sequence is then inhibited using `\exp_not:N`.

---

`\exp_not:n` ★ `\exp_not:n`  $\{\langle tokens \rangle\}$

---

Prevents expansion of the  $\langle tokens \rangle$  in an **e**-type or **x**-type argument. In all other cases the  $\langle tokens \rangle$  continue to be expanded, for example in the input stream or in other types of arguments such as **c**, **f**, **v**. The argument of `\exp_not:n` *must* be surrounded by braces.

**$\text{\TeX}$ hackers note:** This is the  $\varepsilon$ - $\text{\TeX}$  primitive `\unexpanded`. In an **e**-expanding definition (`\cs_new:Npe`), `\exp_not:n` `{#1}` is equivalent to `##1` rather than to `#1`, namely it inserts the two characters `#` and `1`, and `\exp_not:n` `{#}` is equivalent to `#`, namely it inserts the character `#`.

---

`\exp_not:o` ★ `\exp_not:o`  $\{\langle tokens \rangle\}$

---

Expands the  $\langle tokens \rangle$  once, then prevents any further expansion in **e**-type or **x**-type arguments using `\exp_not:n`.

<hr/> <code>\exp_not:V</code> *	<code>\exp_not:V</code> $\langle$ <i>variable</i> $\rangle$
	Recovers the content of the $\langle$ <i>variable</i> $\rangle$ , then prevents expansion of this material in e-type or x-type arguments using <code>\exp_not:n</code> .
<hr/> <code>\exp_not:v</code> *	<code>\exp_not:v</code> $\{ \langle$ <i>tokens</i> $\rangle \}$
	Expands the $\langle$ <i>tokens</i> $\rangle$ until only characters remains, and then converts this into a control sequence which should be a $\langle$ <i>variable</i> $\rangle$ name. The content of the $\langle$ <i>variable</i> $\rangle$ is recovered, and further expansion in e-type or x-type arguments is prevented using <code>\exp_not:n</code> .
<hr/> <code>\exp_not:e</code> *	<code>\exp_not:e</code> $\{ \langle$ <i>tokens</i> $\rangle \}$
	Expands $\langle$ <i>tokens</i> $\rangle$ exhaustively, then protects the result of the expansion (including any tokens which were not expanded) from further expansion in e-type or x-type arguments using <code>\exp_not:n</code> . This is very rarely useful but is provided for consistency.
<hr/> <code>\exp_not:f</code> *	<code>\exp_not:f</code> $\{ \langle$ <i>tokens</i> $\rangle \}$
	Expands $\langle$ <i>tokens</i> $\rangle$ fully until the first unexpandable token is found (if it is a space it is removed). Expansion then stops, and the result of the expansion (including any tokens which were not expanded) is protected from further expansion in e-type or x-type arguments using <code>\exp_not:n</code> .
<hr/> <code>\exp_stop_f:</code> *	<code>\foo_bar:f</code> $\{ \langle$ <i>tokens</i> $\rangle$ <code>\exp_stop_f:</code> $\langle$ <i>more tokens</i> $\rangle$ $\}$
<hr/> <small>Updated: 2011-06-03</small>	This function terminates an f-type expansion. Thus if a function <code>\foo_bar:f</code> starts an f-type expansion and all of $\langle$ <i>tokens</i> $\rangle$ are expandable <code>\exp_stop_f:</code> terminates the expansion of tokens even if $\langle$ <i>more tokens</i> $\rangle$ are also expandable. The function itself is an implicit space token. Inside an e-type or x-type expansion, it retains its form, but when typeset it produces the underlying space ( $\sqcup$ ).

## 5.9 Controlled expansion

The `expl3` language makes all efforts to hide the complexity of  $\text{\TeX}$  expansion from the programmer by providing concepts that evaluate/expand arguments of functions prior to calling the “base” functions. Thus, instead of using many `\expandafter` calls and other trickery it is usually a matter of choosing the right variant of a function to achieve a desired result.

Of course, deep down  $\text{\TeX}$  is using expansion as always and there are cases where a programmer needs to control that expansion directly; typical situations are basic data manipulation tools. This section documents the functions for that level. These commands are used throughout the kernel code, but we hope that outside the kernel there will be little need to resort to them. Instead the argument manipulation methods document above should usually be sufficient.

While `\exp_after:wN` expands one token (out of order) it is sometimes necessary to expand several tokens in one go. The next set of commands provide this functionality. Be aware that it is absolutely required that the programmer has full control over the tokens to be expanded, i.e., it is not possible to use these functions to expand unknown input as part of  $\langle$ *expandable-tokens* $\rangle$  as that will break badly if unexpandable tokens are encountered in that place!

<hr/>	<hr/>
<code>\exp:w</code>	★ <code>\exp:w &lt;expandable tokens&gt; \exp_end:</code>
<code>\exp_end:</code>	★
<hr/>	<hr/>
New: 2015-08-23	Expands <code>&lt;expandable-tokens&gt;</code> until reaching <code>\exp_end:</code> at which point expansion stops. The full expansion of <code>&lt;expandable tokens&gt;</code> has to be empty. If any token in <code>&lt;expandable tokens&gt;</code> or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result <code>\exp_end:</code> will be misinterpreted later on. <sup>3</sup>

In typical use cases the `\exp_end:` is hidden somewhere in the replacement text of `<expandable-tokens>` rather than being on the same expansion level than `\exp:w`, e.g., you may see code such as

```
\exp:w \@@_case:NnTF #1 {#2} { } { }
```

where somewhere during the expansion of `\@@_case:NnTF` the `\exp_end:` gets generated.

**T<sub>E</sub>Xhackers note:** The current implementation uses `\romannumeral` hence ignores space tokens and explicit signs + and - in the expansion of the `<expandable tokens>`, but this should not be relied upon.

<hr/>	<hr/>
<code>\exp:w</code>	★ <code>\exp:w &lt;expandable-tokens&gt; \exp_end_continue_f:w &lt;further-tokens&gt;</code>
<code>\exp_end_continue_f:w</code>	★
<hr/>	<hr/>
New: 2015-08-23	Expands <code>&lt;expandable-tokens&gt;</code> until reaching <code>\exp_end_continue_f:w</code> at which point expansion continues as an f-type expansion expanding <code>&lt;further-tokens&gt;</code> until an unexpandable token is encountered (or the f-type expansion is explicitly terminated by <code>\exp_stop_f:</code> ). As with all f-type expansions a space ending the expansion gets removed.

The full expansion of `<expandable-tokens>` has to be empty. If any token in `<expandable-tokens>` or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result `\exp_end_continue_f:w` will be misinterpreted later on.<sup>4</sup>

In typical use cases `<expandable-tokens>` contains no tokens at all, e.g., you will see code such as

```
\exp_after:wN { \exp:w \exp_end_continue_f:w #2 }
```

where the `\exp_after:wN` triggers an f-expansion of the tokens in #2. For technical reasons this has to happen using two tokens (if they would be hidden inside another command `\exp_after:wN` would only expand the command but not trigger any additional f-expansion).

You might wonder why there are two different approaches available, after all the effect of

```
\exp:w <expandable-tokens> \exp_end:
```

can be alternatively achieved through an f-type expansion by using `\exp_stop_f:`, i.e.

```
\exp:w \exp_end_continue_f:w <expandable-tokens> \exp_stop_f:
```

The reason is simply that the first approach is slightly faster (one less token to parse and less expansion internally) so in places where such performance really matters and where we want to explicitly stop the expansion at a defined point the first form is preferable.

<sup>3</sup>Due to the implementation you might get the character in position 0 in the current font (typically “”) in the output without any error message!

<hr/>	
<code>\exp:w</code>	<code>* \exp:w &lt;expandable-tokens&gt; \exp_end_continue_f:nw &lt;further-tokens&gt;</code>
<code>\exp_end_continue_f:nw</code>	<code>*</code>
<hr/>	
<code>New: 2015-08-23</code>	<p>The difference to <code>\exp_end_continue_f:w</code> is that we first we pick up an argument which is then returned to the input stream. If <code>&lt;further-tokens&gt;</code> starts with space tokens then these space tokens are removed while searching for the argument. If it starts with a brace group then the braces are removed. Thus such spaces or braces will not terminate the f-type expansion.</p>

## 5.10 Internal functions

<hr/>	
<code>\::n</code>	<code>\cs_new:Npn \exp_args:Ncof { \::c \::o \::f \::: }</code>
<code>\::N</code>	Internal forms for the base expansion types. These names do <i>not</i> conform to the general
<code>\::P</code>	$\text{\LaTeX}$ 3 approach as this makes them more readily visible in the log and so forth. They
<code>\::c</code>	should not be used outside this module.
<code>\::o</code>	
<code>\::e</code>	
<code>\::f</code>	
<code>\::x</code>	
<code>\::v</code>	
<code>\::V</code>	
<code>\:::</code>	
<hr/>	
<code>\::o_unbraced</code>	<code>\cs_new:Npn \exp_last_unbraced:Nno { \::n \::o_unbraced \::: }</code>
<code>\::e_unbraced</code>	Internal forms for the expansion types which leave the terminal argument unbraced.
<code>\::f_unbraced</code>	These names do <i>not</i> conform to the general $\text{\LaTeX}$ 3 approach as this makes them more
<code>\::x_unbraced</code>	readily visible in the log and so forth. They should not be used outside this module.
<code>\::v_unbraced</code>	
<code>\::V_unbraced</code>	
<hr/>	

---

<sup>4</sup>In this particular case you may get a character into the output as well as an error message.

## Chapter 6

# The l3sort module

## Sorting functions

### 6.1 Controlling sorting

L<sup>A</sup>T<sub>E</sub>X3 comes with a facility to sort list variables (sequences, token lists, or comma-lists) according to some user-defined comparison. For instance,

```
\clist_set:Nn \l_foo_clist { 3 , 01 , -2 , 5 , +1 }
\clist_sort:Nn \l_foo_clist
{
  \int_compare:nNnTF { #1 } > { #2 }
  { \sort_return_swapped: }
  { \sort_return_same: }
}
```

results in `\l_foo_clist` holding the values `{ -2 , 01 , +1 , 3 , 5 }` sorted in non-decreasing order.

The code defining the comparison should call `\sort_return_swapped:` if the two items given as `#1` and `#2` are not in the correct order, and otherwise it should call `\sort_return_same:` to indicate that the order of this pair of items should not be changed.

For instance, a *comparison code* consisting only of `\sort_return_same:` with no test yields a trivial sort: the final order is identical to the original order. Conversely, using a *comparison code* consisting only of `\sort_return_swapped:` reverses the list (in a fairly inefficient way).

**T<sub>E</sub>Xhackers note:** The current implementation is limited to sorting approximately 20000 items (40000 in LuaT<sub>E</sub>X), depending on what other packages are loaded.

Internally, the code from `l3sort` stores items in `\toks` registers allocated locally. Thus, the *comparison code* should not call `\newtoks` or other commands that allocate new `\toks` registers. On the other hand, altering the value of a previously allocated `\toks` register is not a problem.

<hr/>	
<code>\sort_return_same:</code>	<code>\seq_sort:Nn &lt;seq var&gt;</code>
<code>\sort_return_swapped:</code>	<code>{ ... \sort_return_same: or \sort_return_swapped: ... }</code>
<hr/>	
<small>New: 2017-02-06</small>	Indicates whether to keep the order or swap the order of two items that are compared in the sorting code. Only one of the <code>\sort_return_...</code> functions should be used by the code, according to the results of some tests on the items #1 and #2 to be compared.
<hr/>	

## Chapter 7

# The l3tl-analysis module

## Analysing token lists

This module provides functions that are particularly useful in the `l3regex` module for mapping through a token list one  $\langle token \rangle$  at a time (including begin-group/end-group tokens). For `\tl_analysis_map_inline:Nn` or `\tl_analysis_map_inline:nn`, the token list is given as an argument; the analogous function `\peek_analysis_map_inline:n` documented in `l3token` finds tokens in the input stream instead. In both cases the user provides  $\langle inline\ code \rangle$  that receives three arguments for each  $\langle token \rangle$ :

- $\langle tokens \rangle$ , which both `o`-expand and `e/x`-expand to the  $\langle token \rangle$ . The detailed form of  $\langle tokens \rangle$  may change in later releases.
- $\langle char\ code \rangle$ , a decimal representation of the character code of the  $\langle token \rangle$ ,  $-1$  if it is a control sequence.
- $\langle catcode \rangle$ , a capital hexadecimal digit which denotes the category code of the  $\langle token \rangle$  (0: control sequence, 1: begin-group, 2: end-group, 3: math shift, 4: alignment tab, 6: parameter, 7: superscript, 8: subscript, A: space, B: letter, C: other, D: active). This can be converted to an integer by writing " $\langle catcode \rangle$ ".

In addition, there is a debugging function `\tl_analysis_show:n`, very similar to the `\ShowTokens` macro from the `ted` package.

---

<code>\tl_analysis_show:N</code>	<code>\tl_analysis_show:n {<math>\langle token\ list \rangle</math>}</code>
<code>\tl_analysis_show:n</code>	<code>\tl_analysis_log:n {<math>\langle token\ list \rangle</math>}</code>
<code>\tl_analysis_log:N</code>	Displays to the terminal (or log) the detailed decomposition of the $\langle token\ list \rangle$ into tokens, showing the category code of each character token, the meaning of control sequences and active characters, and the value of registers.
<code>\tl_analysis_log:n</code>	

---

New: 2021-05-11

---

<code>\tl_analysis_map_inline:nn</code>	<code>\tl_analysis_map_inline:nn {<math>\langle token\ list \rangle</math>} {<math>\langle inline\ function \rangle</math>}</code>
<code>\tl_analysis_map_inline:Nn</code>	Applies the $\langle inline\ function \rangle$ to each individual $\langle token \rangle$ in the $\langle token\ list \rangle$ . The $\langle inline\ function \rangle$ receives three arguments as explained above. As all other mappings the mapping is done at the current group level, i.e., any local assignments made by the $\langle inline\ function \rangle$ remain in effect after the loop.

## Chapter 8

# The `l3regex` module

## Regular expressions in $\text{\TeX}$

The `l3regex` module provides regular expression testing, extraction of submatches, splitting, and replacement, all acting on token lists. The syntax of regular expressions is mostly a subset of the PCRE syntax (and very close to POSIX), with some additions due to the fact that  $\text{\TeX}$  manipulates tokens rather than characters. For performance reasons, only a limited set of features are implemented. Notably, back-references are not supported.

Let us give a few examples. After

```
\tl_set:Nn \l_my_tl { That~cat. }
\regex_replace_once:nnN { at } { is } \l_my_tl
```

the token list variable `\l_my_tl` holds the text “`This cat.`”, where the first occurrence of “`at`” was replaced by “`is`”. A more complicated example is a pattern to emphasize each word and add a comma after it:

```
\regex_replace_all:nnN { \w+ } { \c{emph}\cB\{ \0 \cE\} , } \l_my_tl
```

The `\w` sequence represents any “word” character, and `+` indicates that the `\w` sequence should be repeated as many times as possible (at least once), hence matching a word in the input token list. In the replacement text, `\0` denotes the full match (here, a word). The command `\emph` is inserted using `\c{emph}`, and its argument `\0` is put between braces `\cB\{` and `\cE\}`.

If a regular expression is to be used several times, it can be compiled once, and stored in a regex variable using `\regex_set:Nn`. For example,

```
\regex_new:N \l_foo_regex
\regex_set:Nn \l_foo_regex { \c{begin} \cB. (\c[~BE].*) \cE. }
```

stores in `\l_foo_regex` a regular expression which matches the starting marker for an environment: `\begin`, followed by a begin-group token (`\cB.`), then any number of tokens which are neither begin-group nor end-group character tokens (`\c[~BE].*`), ending with an end-group token (`\cE.`). As explained in the next section, the parentheses “capture” the result of `\c[~BE].*`, giving us access to the name of the environment when doing replacements.

## 8.1 Syntax of regular expressions

### 8.1.1 Regular expression examples

We start with a few examples, and encourage the reader to apply `\regex_show:n` to these regular expressions.

- `Cat` matches the word “Cat” capitalized in this way, but also matches the beginning of the word “Cattle”: use `\bCat\b` to match a complete word only.
- `[abc]` matches one letter among “a”, “b”, “c”; the pattern `(a|b|c)` matches the same three possible letters (but see the discussion of submatches below).
- `[A-Za-z]*` matches any number (due to the quantifier `*`) of Latin letters (not accented).
- `\c{[A-Za-z]*}` matches a control sequence made of Latin letters.
- `\_[^_]*\_` matches an underscore, any number of characters other than underscore, and another underscore; it is equivalent to `\_.*?\_` where `.` matches arbitrary characters and the lazy quantifier `*?` means to match as few characters as possible, thus avoiding matching underscores.
- `[\+|-]?d+` matches an explicit integer with at most one sign.
- `[\+|-\_]*d+\_*` matches an explicit integer with any number of `+` and `-` signs, with spaces allowed except within the mantissa, and surrounded by spaces.
- `[\+|-\_]*(d+|\d*\.\d+)\_*` matches an explicit integer or decimal number; using `[.,]` instead of `\.` would allow the comma as a decimal marker.
- `[\+|-\_]*(d+|\d*\.\d+)\_*((?i)pt|in|[cem]m|ex|[bs]p|[dn]d|[pcn]c)\_*` matches an explicit dimension with any unit that T<sub>E</sub>X knows, where `(?i)` means to treat lowercase and uppercase letters identically.
- `[\+|-\_]*((?i)nan|inf|(d+|\d*\.\d+)\_*(e[\+|-\_]d+)?)\_*` matches an explicit floating point number or the special values `nan` and `inf` (with signs and spaces allowed).
- `[\+|-\_]*(d+|\cC.)\_*` matches an explicit integer or control sequence (without checking whether it is an integer variable).
- `\G.*?K` at the beginning of a regular expression matches and discards (due to `\K`) everything between the end of the previous match (`\G`) and what is matched by the rest of the regular expression; this is useful in `\regex_replace_all:nnN` when the goal is to extract matches or submatches in a finer way than with `\regex_extract_all:nnN`.

While it is impossible for a regular expression to match only integer expressions, `[\+|-\(\)*d+\)\([\+|-*/][\+|-\(\)*d+\)\)]*` matches among other things all valid integer expressions (made only with explicit integers). One should follow it with further testing.

### 8.1.2 Characters in regular expressions

Most characters match exactly themselves, with an arbitrary category code. Some characters are special and must be escaped with a backslash (*e.g.*, `\*` matches a star character). Some escape sequences of the form backslash-letter also have a special meaning (for instance `\d` matches any digit). As a rule,

- every alphanumeric character (A–Z, a–z, 0–9) matches exactly itself, and should not be escaped, because `\A`, `\B`, ... have special meanings;
- non-alphanumeric printable ascii characters can (and should) always be escaped: many of them have special meanings (*e.g.*, use `\(`, `\)`, `\?`, `\.`, `\^`);
- spaces should always be escaped (even in character classes);
- any other character may be escaped or not, without any effect: both versions match exactly that character.

Note that these rules play nicely with the fact that many non-alphanumeric characters are difficult to input into  $\text{\TeX}$  under normal category codes. For instance, `\\abc\%` matches the characters `\abc%` (with arbitrary category codes), but does not match the control sequence `\abc` followed by a percent character. Matching control sequences can be done using the `\c{<regex>}` syntax (see below).

Any special character which appears at a place where its special behaviour cannot apply matches itself instead (for instance, a quantifier appearing at the beginning of a string), after raising a warning.

Characters.

`\x{hh...}` Character with hex code `hh...`

`\xhh` Character with hex code `hh`.

`\a` Alarm (hex 07).

`\e` Escape (hex 1B).

`\f` Form-feed (hex 0C).

`\n` New line (hex 0A).

`\r` Carriage return (hex 0D).

`\t` Horizontal tab (hex 09).

### 8.1.3 Characters classes

Character properties.

`.` A single period matches any token.

`\d` Any decimal digit.

`\h` Any horizontal space character, equivalent to `[\ \^~I]`: space and tab.

`\s` Any space character, equivalent to `[\ \^~I\^~J\^~L\^~M]`.

`\v` Any vertical space character, equivalent to `[\^J\^K\^L\^M]`. Note that `\^K` is a vertical space, but not a space, for compatibility with Perl.

`\w` Any word character, i.e., alphanumerics and underscore, equivalent to the explicit class `[A-Za-z0-9\_]`.

`\D` Any token not matched by `\d`.

`\H` Any token not matched by `\h`.

`\N` Any token other than the `\n` character (hex 0A).

`\S` Any token not matched by `\s`.

`\V` Any token not matched by `\v`.

`\W` Any token not matched by `\w`.

Of those, `.`, `\D`, `\H`, `\N`, `\S`, `\V`, and `\W` match arbitrary control sequences.

Character classes match exactly one token in the subject.

`[...]` Positive character class. Matches any of the specified tokens.

`[^...]` Negative character class. Matches any token other than the specified characters.

`[x-y]` Within a character class, this denotes a range (can be used with escaped characters).

`[:<name>:]` Within a character class (one more set of brackets), this denotes the POSIX character class `<name>`, which can be `alnum`, `alpha`, `ascii`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `word`, or `xdigit`.

`[^<name>:]` Negative POSIX character class.

For instance, `[a-oq-z\cC.]` matches any lowercase latin letter except `p`, as well as control sequences (see below for a description of `\c`).

In character classes, only `[`, `^`, `-`, `]`, `\` and spaces are special, and should be escaped. Other non-alphanumeric characters can still be escaped without harm. Any escape sequence which matches a single character (`\d`, `\D`, etc.) is supported in character classes. If the first character is `^`, then the meaning of the character class is inverted; `^` appearing anywhere else in the range is not special. If the first character (possibly following a leading `^`) is `]` then it does not need to be escaped since ending the range there would make it empty. Ranges of characters can be expressed using `-`, for instance, `[\D 0-5]` and `[^6-9]` are equivalent.

#### 8.1.4 Structure: alternatives, groups, repetitions

Quantifiers (repetition).

`?` 0 or 1, greedy.

`??` 0 or 1, lazy.

`*` 0 or more, greedy.

`*?` 0 or more, lazy.

`+` 1 or more, greedy.

`+?` 1 or more, lazy.

`{n}` Exactly  $n$ .

`{n,}`  $n$  or more, greedy.

`{n,}?`   $n$  or more, lazy.

`{n,m}` At least  $n$ , no more than  $m$ , greedy.

`{n,m}?`  At least  $n$ , no more than  $m$ , lazy.

For greedy quantifiers the regex code will first investigate matches that involve as many repetitions as possible, while for lazy quantifiers it investigates matches with as few repetitions as possible first.

Alternation and capturing groups.

`A|B|C` Either one of A, B, or C, investigating A first.

`(...)` Capturing group.

`(?:...)` Non-capturing group.

`(?|...)` Non-capturing group which resets the group number for capturing groups in each alternative. The following group is numbered with the first unused group number.

Capturing groups are a means of extracting information about the match. Parenthesized groups are labelled in the order of their opening parenthesis, starting at 1. The contents of those groups corresponding to the “best” match (leftmost longest) can be extracted and stored in a sequence of token lists using for instance `\regex_extract_once:nnTF`.

The `\K` escape sequence resets the beginning of the match to the current position in the token list. This only affects what is reported as the full match. For instance,

```
\regex_extract_all:nnN { a \K . } { a123aaxyz } \l_foo_seq
```

results in `\l_foo_seq` containing the items `{1}` and `{a}`: the true matches are `{a1}` and `{aa}`, but they are trimmed by the use of `\K`. The `\K` command does not affect capturing groups: for instance,

```
\regex_extract_once:nnN { (. \K c)+ \d } { acbc3 } \l_foo_seq
```

results in `\l_foo_seq` containing the items `{c3}` and `{bc}`: the true match is `{acbc3}`, with first submatch `{bc}`, but `\K` resets the beginning of the match to the last position where it appears.

### 8.1.5 Matching exact tokens

The `\c` escape sequence allows to test the category code of tokens, and match control sequences. Each character category is represented by a single uppercase letter:

- C for control sequences;
- B for begin-group tokens;
- E for end-group tokens;

- M for math shift;
- T for alignment tab tokens;
- P for macro parameter tokens;
- U for superscript tokens (up);
- D for subscript tokens (down);
- S for spaces;
- L for letters;
- O for others; and
- A for active characters.

The `\c` escape sequence is used as follows.

`\c{<regex>}` A control sequence whose csname matches the `<regex>`, anchored at the beginning and end, so that `\c{begin}` matches exactly `\begin`, and nothing else.

`\cX` Applies to the next object, which can be a character, escape character sequence such as `\x{0A}`, character class, or group, and forces this object to only match tokens with category X (any of CBEMTPUDSLOA). For instance, `\cL[A-Z\d]` matches uppercase letters and digits of category code letter, `\cC.` matches any control sequence, and `\cO(abc)` matches `abc` where each character has category other.<sup>5</sup>

`\c[XYZ]` Applies to the next object, and forces it to only match tokens with category X, Y, or Z (each being any of CBEMTPUDSLOA). For instance, `\c[LSO](..)` matches two tokens of category letter, space, or other.

`\c[^XYZ]` Applies to the next object and prevents it from matching any token with category X, Y, or Z (each being any of CBEMTPUDSLOA). For instance, `\c[^O]\d` matches digits which have any category different from other.

The category code tests can be used inside classes; for instance, `[\cO\d \c[L0][A-F]]` matches what T<sub>E</sub>X considers as hexadecimal digits, namely digits with category other, or uppercase letters from A to F with category either letter or other. Within a group affected by a category code test, the outer test can be overridden by a nested test: for instance, `\cL(ab\cO\*cd)` matches `ab*cd` where all characters are of category letter, except `*` which has category other.

The `\u` escape sequence allows to insert the contents of a token list directly into a regular expression or a replacement, avoiding the need to escape special characters. Namely, `\u{<var name>}` matches the exact contents (both character codes and category codes) of the variable `\<var name>`, which are obtained by applying `\exp_not:v{<var name>}` at the time the regular expression is compiled. Within a `\c{...}` control sequence matching, the `\u` escape sequence only expands its argument once, in effect performing `\tl_to_str:v`. Quantifiers are supported.

The `\ur` escape sequence allows to insert the contents of a `regex` variable into a larger regular expression. For instance, `A\ur{1_tmpa_regex}D` matches the tokens A and

---

<sup>5</sup>This last example also captures “`abc`” as a regex group; to avoid this use a non-capturing group `\cO(?:abc)`.

D separated by something that matches the regular expression `\l_tmpa_regex`. This behaves as if a non-capturing group were surrounding `\l_tmpa_regex`, and any group contained in `\l_tmpa_regex` is converted to a non-capturing group. Quantifiers are supported.

For instance, if `\l_tmpa_regex` has value `B|C`, then `A\ur{\l_tmpa_regex}D` is equivalent to `A(?:B|C)D` (matching `ABD` or `ACD`) and not to `AB|CD` (matching `AB` or `CD`). To get the latter effect, it is simplest to use TeX's expansion machinery directly: if `\l_mymodule_BC_tl` contains `B|C` then the following two lines show the same result:

```
\regex_show:n { A \u{\l_mymodule_BC_tl} D }
\regex_show:n { A B | C D }
```

### 8.1.6 Miscellaneous

anchors and simple assertions.

`\b` Word boundary: either the previous token is matched by `\w` and the next by `\W`, or the opposite. For this purpose, the ends of the token list are considered as `\W`.

`\B` Not a word boundary: between two `\w` tokens or two `\W` tokens (including the boundary).

`^` or `\A` Start of the subject token list.

`$`, `\Z` or `\z` End of the subject token list.

`\G` Start of the current match. This is only different from `^` in the case of multiple matches: for instance `\regex_count:nnN { \G a } { aaba } \l_tmpa_int` yields 2, but replacing `\G` by `^` would result in `\l_tmpa_int` holding the value 1.

The option `(?i)` makes the match case insensitive (treating `A–Z` and `a–z` as equivalent, with no support yet for Unicode case changing). This applies until the end of the group in which it appears, and can be reverted using `(?-i)`. For instance, in `(?i)(a(?-i)b|c)d`, the letters `a` and `d` are affected by the `i` option. Characters within ranges and classes are affected individually: `(?i)[\?-B]` is equivalent to `[\?@ABab]` (and differs from the much larger class `[\?-b]`), and `(?i)[^aeiou]` matches any character which is not a vowel. The `i` option has no effect on `\c{...}`, on `\u{...}`, on character properties, or on character classes, for instance it has no effect at all in `(?i)\u{\l_foo_tl}\d\d[:lower:]`.

## 8.2 Syntax of the replacement text

Most of the features described in regular expressions do not make sense within the replacement text. Backslash introduces various special constructions, described further below:

- `\0` is the whole match;
- `\1` is the submatch that was matched by the first (capturing) group (...); similarly for `\2`, ..., `\9` and `\g{<number>}`;
- `\_` inserts a space (spaces are ignored when not escaped);

- `\a, \e, \f, \n, \r, \t, \xhh, \x{hhh}` correspond to single characters as in regular expressions;
- `\c{<cs name>}` inserts a control sequence;
- `\c{<category>}<character>` (see below);
- `\u{<tl var name>}` inserts the contents of the `<tl var>` (see below).

Characters other than backslash and space are simply inserted in the result (but since the replacement text is first converted to a string, one should also escape characters that are special for  $\text{\TeX}$ , for instance use `\#`). Non-alphanumeric characters can always be safely escaped with a backslash.

For instance,

```
\tl_set:Nn \l_my_tl { Hello,~world! }
\regex_replace_all:nnN { ([er]?1|o) . } { (\0--\1) } \l_my_tl
```

results in `\l_my_tl` holding `H(e11--e1)(o,--o) w(or--o)(1d--1)!`

The submatches are numbered according to the order in which the opening parenthesis of capturing groups appear in the regular expression to match. The  $n$ -th submatch is empty if there are fewer than  $n$  capturing groups or for capturing groups that appear in alternatives that were not used for the match. In case a capturing group matches several times during a match (due to quantifiers) only the last match is used in the replacement text. Submatches always keep the same category codes as in the original token list.

By default, the category code of characters inserted by the replacement are determined by the prevailing category code régime at the time where the replacement is made, with two exceptions:

- space characters (with character code 32) inserted with `\_` or `\x20` or `\x{20}` have category code 10 regardless of the prevailing category code régime;
- if the category code would be 0 (escape), 5 (newline), 9 (ignore), 14 (comment) or 15 (invalid), it is replaced by 12 (other) instead.

The escape sequence `\c` allows to insert characters with arbitrary category codes, as well as control sequences.

`\cX(...)` Produces the characters “...” with category `X`, which must be one of `CBEMTPUDSLOA` as in regular expressions. Parentheses are optional for a single character (which can be an escape sequence). When nested, the innermost category code applies, for instance `\cL(Hello\cS\ world)!` gives this text with standard category codes.

`\c{<text>}` Produces the control sequence with csname `<text>`. The `<text>` may contain references to the submatches `\0`, `\1`, and so on, as in the example for `\u` below.

The escape sequence `\u{<var name>}` allows to insert the contents of the variable with name `<var name>` directly into the replacement, giving an easier control of category codes. When nested in `\c{...}` and `\u{...}` constructions, the `\u` and `\c` escape sequences perform `\tl_to_str:v`, namely extract the value of the control sequence and turn it into a string. Matches can also be used within the arguments of `\c` and `\u`. For instance,

```
\tl_set:Nn \l_my_one_tl { first }
\tl_set:Nn \l_my_two_tl { \emph{second} }
\tl_set:Nn \l_my_tl { one , two , one , one }
\regex_replace_all:nnN { [^,]+ } { \u{1_my_\0_tl} } \l_my_tl
```

results in `\l_my_tl` holding `first,\emph{second},first,first`.

Regex replacement is also a convenient way to produce token lists with arbitrary category codes. For instance

```
\tl_clear:N \l_tmpa_tl
\regex_replace_all:nnN { } { \cU\% \cA\~ } \l_tmpa_tl
```

results in `\l_tmpa_tl` containing the percent character with category code 7 (superscript) and an active tilde character.

## 8.3 Pre-compiling regular expressions

If a regular expression is to be used several times, it is better to compile it once rather than doing it each time the regular expression is used. The compiled regular expression is stored in a variable. All of the `l3regex` module's functions can be given their regular expression argument either as an explicit string or as a compiled regular expression.

<hr/> <code>\regex_new:N</code> <hr/>	<code>\regex_new:N &lt;regex var&gt;</code>
<hr/> New: 2017-05-26 <hr/>	Creates a new <code>&lt;regex var&gt;</code> or raises an error if the name is already taken. The declaration is global. The <code>&lt;regex var&gt;</code> is initially such that it never matches.
<hr/> <code>\regex_set:Nn</code> <code>\regex_gset:Nn</code> <hr/>	<code>\regex_set:Nn &lt;regex var&gt; {&lt;regex&gt;}</code>
<hr/> New: 2017-05-26 <hr/>	Stores a compiled version of the <code>&lt;regex&gt;</code> in the <code>&lt;regex var&gt;</code> . The assignment is local for <code>\regex_set:Nn</code> and global for <code>\regex_gset:Nn</code> . For instance, this function can be used as
	<pre> \regex_new:N \l_my_regex \regex_set:Nn \l_my_regex { my\ (simple\ )? reg(ex ular\ expression) }</pre>
<hr/> <code>\regex_const:Nn</code> <hr/>	<code>\regex_const:Nn &lt;regex var&gt; {&lt;regex&gt;}</code>
<hr/> New: 2017-05-26 <hr/>	Creates a new constant <code>&lt;regex var&gt;</code> or raises an error if the name is already taken. The value of the <code>&lt;regex var&gt;</code> is set globally to the compiled version of the <code>&lt;regex&gt;</code> .
<hr/> <code>\regex_show:N</code> <code>\regex_show:n</code> <code>\regex_log:N</code> <code>\regex_log:n</code> <hr/>	<code>\regex_show:n {&lt;regex&gt;}</code> <code>\regex_log:n {&lt;regex&gt;}</code>
<hr/> New: 2021-04-26 Updated: 2021-04-29 <hr/>	Displays in the terminal or writes in the log file (respectively) how <code>l3regex</code> interprets the <code>&lt;regex&gt;</code> . For instance, <code>\regex_show:n {\A X Y}</code> shows
	<pre> +-branch   anchor at start (\A)   char code 88 (X) +-branch   char code 89 (Y)</pre>

indicating that the anchor `\A` only applies to the first branch: the second branch is not anchored to the beginning of the match.

## 8.4 Matching

All regular expression functions are available in both `:n` and `:N` variants. The former require a “standard” regular expression, while the later require a compiled expression as generated by `\regex_set:Nn`.

<code>\regex_if_match:nnTF</code>	<code>\regex_if_match:nnTF {&lt;regex&gt;} {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_if_match:nVTF</code>	
<code>\regex_if_match:NnTF</code>	Tests whether the <code>&lt;regex&gt;</code> matches any part of the <code>&lt;token list&gt;</code> . For instance,
<code>\regex_if_match:NVTF</code>	<code>\regex_if_match:nnTF { b [cde]* } { abecdcx } { TRUE } { FALSE }</code>
	<code>\regex_if_match:nnTF { [b-dq-w] } { example } { TRUE } { FALSE }</code>

New: 2025-05-14

leaves TRUE then FALSE in the input stream.

<code>\regex_count:nnN</code>	<code>\regex_count:nnN {&lt;regex&gt;} {&lt;token list&gt;} &lt;integer&gt;</code>
<code>\regex_count:nVN</code>	
<code>\regex_count:NnN</code>	Sets <code>&lt;integer&gt;</code> within the current TeX group level equal to the number of times <code>&lt;regex&gt;</code>
<code>\regex_count:NVN</code>	appears in <code>&lt;token list&gt;</code> . The search starts by finding the left-most longest match,
	respecting greedy and lazy (non-greedy) operators. Then the search starts again from
	the character following the last character of the previous match, until reaching the end of
	the token list. Infinite loops are prevented in the case where the regular expression can
	match an empty token list: then we count one match between each pair of characters.
	For instance,

New: 2017-05-26

```
\int_new:N \l_foo_int
\regex_count:nnN { (b+|c) } { abbababcbbb } \l_foo_int
```

results in `\l_foo_int` taking the value 5.

<code>\regex_match_case:nn</code>	<code>\regex_match_case:nnTF</code>
<code>\regex_match_case:nnTF</code>	{
	{<regex <sub>1</sub> >} {<code case <sub>1</sub> >}
	{<regex <sub>2</sub> >} {<code case <sub>2</sub> >}
	...
	{<regex <sub>n</sub> >} {<code case <sub>n</sub> >}
	} {<token list>}
	{<true code>} {<false code>}

New: 2022-01-10

Determines which of the `<regular expressions>` matches at the earliest point in the `<token list>`, and leaves the corresponding `<code>` followed by the `<true code>` in the input stream. If several `<regex>` match starting at the same point, then the first one in the list is selected and the others are discarded. If none of the `<regex>` match, the `<false code>` is left in the input stream. Each `<regex>` can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the `<token list>`, each of the `<regex>` is searched in turn. If one of them matches then the corresponding `<code>` is used and everything else is discarded, while if none of the `<regex>` match at a given position then the next starting position is attempted. If none of the `<regex>` match anywhere in the `<token list>` then nothing is left in the input stream. Note that this differs from nested `\regex_if_match:nnTF` statements since all `<regex>` are attempted at each position rather than attempting to match `<regex1>` at every position before moving on to `<regex2>`.

## 8.5 Submatch extraction

<code>\regex_extract_once:nnN</code>	<code>\regex_extract_once:nnN {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt;</code>
<code>\regex_extract_once:nVN</code>	<code>\regex_extract_once:nnNTF {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_extract_once:nnNTF</code>	
<code>\regex_extract_once:nVNTF</code>	Finds the first match of the <code>&lt;regex&gt;</code> in the <code>&lt;token list&gt;</code> . If it exists, the match is stored as the first item of the <code>&lt;seq var&gt;</code> , and further items are the contents of capturing groups, in the order of their opening parenthesis. The <code>&lt;seq var&gt;</code> is assigned locally. If there is no match, the <code>&lt;seq var&gt;</code> is cleared. The testing versions insert the <code>&lt;true code&gt;</code> into the input stream if a match was found, and the <code>&lt;false code&gt;</code> otherwise.
<code>\regex_extract_once:NnN</code>	
<code>\regex_extract_once:NVN</code>	
<code>\regex_extract_once:NnNTF</code>	
<code>\regex_extract_once:NVNTF</code>	

---

New: 2017-05-26

For instance, assume that you type

```
\regex_extract_once:nnNTF { \A(La)?TeX(!*)\Z } { LaTeX!!! } \l_foo_seq
{ true } { false }
```

Then the regular expression (anchored at the start with `\A` and at the end with `\Z`) must match the whole token list. The first capturing group, `(La)?`, matches `La`, and the second capturing group, `(!*)`, matches `!!!`. Thus, `\l_foo_seq` contains as a result the items `{LaTeX!!!}`, `{La}`, and `{!!!}`, and the `true` branch is left in the input stream. Note that the  $n$ -th item of `\l_foo_seq`, as obtained using `\seq_item:Nn`, correspond to the submatch numbered  $(n - 1)$  in functions such as `\regex_replace_once:nnN`.

<code>\regex_extract_all:nnN</code>	<code>\regex_extract_all:nnN {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt;</code>
<code>\regex_extract_all:nVN</code>	<code>\regex_extract_all:nnNTF {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_extract_all:nnNTF</code>	
<code>\regex_extract_all:nVNTF</code>	Finds all matches of the <code>&lt;regex&gt;</code> in the <code>&lt;token list&gt;</code> , and stores all the submatch information in a single sequence (concatenating the results of multiple <code>\regex_extract_once:nnN</code> calls). The <code>&lt;seq var&gt;</code> is assigned locally. If there is no match, the <code>&lt;seq var&gt;</code> is cleared. The testing versions insert the <code>&lt;true code&gt;</code> into the input stream if a match was found, and the <code>&lt;false code&gt;</code> otherwise. For instance, assume that you type
<code>\regex_extract_all:NnN</code>	
<code>\regex_extract_all:NVN</code>	
<code>\regex_extract_all:NnNTF</code>	
<code>\regex_extract_all:NVNTF</code>	

---

New: 2017-05-26

```
\regex_extract_all:nnNTF { \w+ } { Hello,~world! } \l_foo_seq
{ true } { false }
```

Then the regular expression matches twice, the resulting sequence contains the two items `{Hello}` and `{world}`, and the `true` branch is left in the input stream.

---

<code>\regex_split:nnN</code>	<code>\regex_split:nnN {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt;</code>
<code>\regex_split:nVN</code>	<code>\regex_split:nnNTF {&lt;regex&gt;} {&lt;token list&gt;} &lt;seq var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_split:nnNTF</code>	Splits the <code>&lt;token list&gt;</code> into a sequence of parts, delimited by matches of the <code>&lt;regex&gt;</code> .
<code>\regex_split:nVNTF</code>	If the <code>&lt;regex&gt;</code> has capturing groups, then the token lists that they match are stored as items of the sequence as well. The assignment to <code>&lt;seq var&gt;</code> is local. If no match is
<code>\regex_split:NnN</code>	found the resulting <code>&lt;seq var&gt;</code> has the <code>&lt;token list&gt;</code> as its sole item. If the <code>&lt;regex&gt;</code>
<code>\regex_split:NVN</code>	matches the empty token list, then the <code>&lt;token list&gt;</code> is split into single tokens. The
<code>\regex_split:NnNTF</code>	testing versions insert the <code>&lt;true code&gt;</code> into the input stream if a match was found, and
<code>\regex_split:NVNTF</code>	the <code>&lt;false code&gt;</code> otherwise. For example, after

---

New: 2017-05-26

---

```

\seq_new:N \l_path_seq
\regex_split:nnNTF { / } { the/path/for/this/file.tex } \l_path_seq
{ true } { false }

```

the sequence `\l_path_seq` contains the items `{the}`, `{path}`, `{for}`, `{this}`, and `{file.tex}`, and the `true` branch is left in the input stream.

## 8.6 Replacement

---

<code>\regex_replace_once:nnN</code>	<code>\regex_replace_once:nnN {&lt;regex&gt;} {&lt;replacement&gt;} &lt;t1 var&gt;</code>
<code>\regex_replace_once:nVN</code>	<code>\regex_replace_once:nnNTF {&lt;regex&gt;} {&lt;replacement&gt;} &lt;t1 var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_replace_once:nnNTF</code>	
<code>\regex_replace_once:nVNTF</code>	Searches for the <code>&lt;regex&gt;</code> in the contents of the <code>&lt;t1 var&gt;</code> and replaces the first match with
<code>\regex_replace_once:NnN</code>	the <code>&lt;replacement&gt;</code> . In the <code>&lt;replacement&gt;</code> , <code>\0</code> represents the full match, <code>\1</code> represents
<code>\regex_replace_once:NVN</code>	the contents of the first capturing group, <code>\2</code> of the second, etc. The result is assigned
<code>\regex_replace_once:NnNTF</code>	locally to <code>&lt;t1 var&gt;</code> .
<code>\regex_replace_once:NVNTF</code>	

---

New: 2017-05-26

---

<code>\regex_replace_all:nnN</code>	<code>\regex_replace_all:nnN {&lt;regex&gt;} {&lt;replacement&gt;} &lt;t1 var&gt;</code>
<code>\regex_replace_all:nVN</code>	<code>\regex_replace_all:nnNTF {&lt;regex&gt;} {&lt;replacement&gt;} &lt;t1 var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\regex_replace_all:nnNTF</code>	
<code>\regex_replace_all:nVNTF</code>	Replaces all occurrences of the <code>&lt;regex&gt;</code> in the contents of the <code>&lt;t1 var&gt;</code> by the
<code>\regex_replace_all:NnN</code>	<code>&lt;replacement&gt;</code> , where <code>\0</code> represents the full match, <code>\1</code> represents the contents of the
<code>\regex_replace_all:NVN</code>	first capturing group, <code>\2</code> of the second, etc. Every match is treated independently, and
<code>\regex_replace_all:NnNTF</code>	matches cannot overlap. The result is assigned locally to <code>&lt;t1 var&gt;</code> .
<code>\regex_replace_all:NVNTF</code>	

---

New: 2017-05-26

<code>\regex_replace_case_once:nN</code>	<code>\regex_replace_case_once:nNTF</code>
<code>\regex_replace_case_once:nNTF</code>	<pre> {   {&lt;regex<sub>1</sub>&gt;} {&lt;replacement<sub>1</sub>&gt;}   {&lt;regex<sub>2</sub>&gt;} {&lt;replacement<sub>2</sub>&gt;}   ...   {&lt;regex<sub>n</sub>&gt;} {&lt;replacement<sub>n</sub>&gt;} } &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;} </pre>
New: 2022-01-10	

Replaces the earliest match of the regular expression  $(?| \langle \text{regex}_1 \rangle | \dots | \langle \text{regex}_n \rangle )$  in the  $\langle \text{tl var} \rangle$  by the  $\langle \text{replacement} \rangle$  corresponding to which  $\langle \text{regex}_i \rangle$  matched, then leaves the  $\langle \text{true code} \rangle$  in the input stream. If none of the  $\langle \text{regex} \rangle$  match, then the  $\langle \text{tl var} \rangle$  is not modified, and the  $\langle \text{false code} \rangle$  is left in the input stream. Each  $\langle \text{regex} \rangle$  can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the  $\langle \text{token list} \rangle$ , each of the  $\langle \text{regex} \rangle$  is searched in turn. If one of them matches then it is replaced by the corresponding  $\langle \text{replacement} \rangle$  as described for `\regex_replace_once:nnN`. This is equivalent to checking with `\regex_match_case:nn` which  $\langle \text{regex} \rangle$  matches, then performing the replacement with `\regex_replace_once:nnN`.

<code>\regex_replace_case_all:nN</code>	<code>\regex_replace_case_all:nNTF</code>
<code>\regex_replace_case_all:nNTF</code>	<pre> {   {&lt;regex<sub>1</sub>&gt;} {&lt;replacement<sub>1</sub>&gt;}   {&lt;regex<sub>2</sub>&gt;} {&lt;replacement<sub>2</sub>&gt;}   ...   {&lt;regex<sub>n</sub>&gt;} {&lt;replacement<sub>n</sub>&gt;} } &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;} </pre>
New: 2022-01-10	

Replaces all occurrences of all  $\langle \text{regex} \rangle$  in the  $\langle \text{token list} \rangle$  by the corresponding  $\langle \text{replacement} \rangle$ . Every match is treated independently, and matches cannot overlap. The result is assigned locally to  $\langle \text{tl var} \rangle$ , and the  $\langle \text{true code} \rangle$  or  $\langle \text{false code} \rangle$  is left in the input stream depending on whether any replacement was made or not.

In detail, for each starting position in the  $\langle \text{token list} \rangle$ , each of the  $\langle \text{regex} \rangle$  is searched in turn. If one of them matches then it is replaced by the corresponding  $\langle \text{replacement} \rangle$ , and the search resumes at the position that follows this match (and replacement). For instance

```

\tl_set:Nn \l_tmpa_tl { Hello,~world! }
\regex_replace_case_all:nN
{
  { [A-Za-z]+ } { ‘\0’ }
  { \b } { --- }
  { . } { [\0] }
} \l_tmpa_tl

```

results in  $\backslash\l\_tmpa\_tl$  having the contents ‘Hello’---[,] [ ] ‘world’---[!]. Note in particular that the word-boundary assertion `\b` did not match at the start of words because the case `[A-Za-z]+` matched at these positions. To change this, one could simply swap the order of the two cases in the argument of `\regex_replace_case_all:nN`.

## 8.7 Scratch regular expressions

<code>\l_tmpa_regex</code>	Scratch regex for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_regex</code>	
New: 2017-12-11	

<code>\g_tmpa_regex</code>	Scratch regex for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_regex</code>	
New: 2017-12-11	

## 8.8 Bugs, misfeatures, future work, and other possibilities

The following need to be done now.

- Rewrite the documentation in a more ordered way, perhaps add a BNF?
- Additional error-checking to come.
- Clean up the use of messages.
- Cleaner error reporting in the replacement phase.
- Add tracing information.
- Detect attempts to use back-references and other non-implemented syntax.
- Test for the maximum register `\c_max_register_int`.
- Find out whether the fact that `\W` and friends match the end-marker leads to bugs. Possibly update `\_regex_item_reverse:n`.
- The empty cs should be matched by `\c{}`, not by `\c{csname.?endcsname\s?}`.

Code improvements to come.

- Shift arrays so that the useful information starts at position 1.
- Only build `\c{...}` once.
- Use arrays for the left and right state stacks when compiling a regex.
- Should `\_regex_action_free_group:n` only be used for greedy `{n,}` quantifier? (I think not.)
- Quantifiers for `\u` and assertions.
- When matching, keep track of an explicit stack of `curr_state` and `curr_submatches`.
- If possible, when a state is reused by the same thread, kill other subthreads.

- Use an array rather than `\g__regex_balance_t1` to build the function `\__regex_replacement_balance_one_match:n`.
- Reduce the number of epsilon-transitions in alternatives.
- Optimize simple strings: use less states (`abcade` should give two states, for `abc` and `ade`). [Does that really make sense?]
- Optimize groups with no alternative.
- Optimize states with a single `\__regex_action_free:n`.
- Optimize the use of `\__regex_action_success:` by inserting it in state 2 directly instead of having an extra transition.
- Optimize the use of `\int_step_...` functions.
- Groups don't capture within regexes for csnames; optimize and document.
- Better “show” for anchors, properties, and catcode tests.
- Does `\K` really need a new state for itself?
- When compiling, use a boolean `in_cs` and less magic numbers.

The following features are likely to be implemented at some point in the future.

- General look-ahead/behind assertions.
- Regex matching on external files.
- Conditional subpatterns with look ahead/behind: “if what follows is [...], then [...]”.
- `(*..)` and `(?..)` sequences to set some options.
- UTF-8 mode for pdfTeX.
- Newline conventions are not done. In particular, we should have an option for `.` not to match newlines. Also, `\A` should differ from `^`, and `\Z`, `\z` and `$` should differ.
- Unicode properties: `\p{..}` and `\P{..}`; `\X` which should match any “extended” Unicode sequence. This requires to manipulate a lot of data, probably using tree-boxes.

The following features of PCRE or Perl may or may not be implemented.

- Callout with `(?C...)` or other syntax: some internal code changes make that possible, and it can be useful for instance in the replacement code to stop a regex replacement when some marker has been found; this raises the question of a potential `\regex_break:` and then of playing well with `\tl_map_break:` called from within the code in a regex. It also raises the question of nested calls to the regex machinery, which is a problem since `\fontdimen` are global.
- Conditional subpatterns (other than with a look-ahead or look-behind condition): this is non-regular, isn't it?

- Named subpatterns:  $\text{\TeX}$  programmers have lived so far without any need for named macro parameters.

The following features of PCRE or Perl will definitely not be implemented.

- Back-references: non-regular feature, this requires backtracking, which is prohibitively slow.
- Recursion: this is a non-regular feature.
- Atomic grouping, possessive quantifiers: those tools, mostly meant to fix catastrophic backtracking, are unnecessary in a non-backtracking algorithm, and difficult to implement.
- Subroutine calls: this syntactic sugar is difficult to include in a non-backtracking algorithm, in particular because the corresponding group should be treated as atomic.
- Backtracking control verbs: intrinsically tied to backtracking.
- $\backslash\text{ddd}$ , matching the character with octal code  $\text{ddd}$ : we already have  $\backslash\text{x}\{\dots\}$  and the syntax is confusingly close to what we could have used for backreferences ( $\backslash 1$ ,  $\backslash 2$ , ...), making it harder to produce useful error message.
- $\backslash\text{cx}$ , similar to  $\text{\TeX}$ 's own  $\backslash\text{\textasciicircum}\text{x}$ .
- Comments:  $\text{\TeX}$  already has its own system for comments.
- $\backslash\text{Q}\dots\backslash\text{E}$  escaping: this would require to read the argument verbatim, which is not in the scope of this module.
- $\backslash\text{C}$  single byte in UTF-8 mode:  $\text{Xe}\text{\TeX}$  and  $\text{Lua}\text{\TeX}$  serve us characters directly, and splitting those into bytes is tricky, encoding dependent, and most likely not useful anyways.

## Chapter 9

# The l3prg module

## Control structures

Conditional processing in L<sup>A</sup>T<sub>E</sub>X3 is defined as something that performs a series of tests, possibly involving assignments and calling other functions that do not read further ahead in the input stream. After processing the input, a *state* is returned. The states returned are *⟨true⟩* and *⟨false⟩*.

L<sup>A</sup>T<sub>E</sub>X3 has two forms of conditional flow processing based on these states. The first form is predicate functions that turn the returned state into a boolean *⟨true⟩* or *⟨false⟩*. For example, the function `\cs_if_free_p:N` checks whether the control sequence given as its argument is free and then returns the boolean *⟨true⟩* or *⟨false⟩* values to be used in testing with `\if_predicate:w` or in functions to be described below. The second form is the kind of functions choosing a particular argument from the input stream based on the result of the testing as in `\cs_if_free:NTF` which also takes one argument (the N) and then executes either `true` or `false` depending on the result.

**T<sub>E</sub>Xhackers note:** The arguments are executed after exiting the underlying `\if... \fi:` structure.

## 9.1 Defining a set of conditional functions

---

<code>\prg_new_conditional:Npnn</code>	<code>\prg_new_conditional:Npnn \&lt;name&gt;:\&lt;arg spec&gt; \&lt;parameters&gt; {\&lt;conditions&gt;}</code>
<code>\prg_set_conditional:Npnn</code>	<code>{\&lt;code&gt;}</code>
<code>\prg_gset_conditional:Npnn</code>	<code>\prg_new_conditional:Nnn \&lt;name&gt;:\&lt;arg spec&gt; {\&lt;conditions&gt;} {\&lt;code&gt;}</code>
<code>\prg_new_protected_conditional:Npnn</code>	
<code>\prg_set_protected_conditional:Npnn</code>	
<code>\prg_gset_protected_conditional:Npnn</code>	
<code>\prg_new_conditional:Nnn</code>	
<code>\prg_set_conditional:Nnn</code>	
<code>\prg_gset_conditional:Nnn</code>	
<code>\prg_new_protected_conditional:Nnn</code>	
<code>\prg_set_protected_conditional:Nnn</code>	
<code>\prg_gset_protected_conditional:Nnn</code>	

---

Updated: 2022-11-01

---

These functions create a family of conditionals using the same `<code>` to perform the test created. Those non-protected conditionals are expandable if `<code>` is. The **new** versions check for existing definitions and perform assignments globally (*cf.* `\cs_new:Npn`) whereas the **set** versions do no check and perform assignments locally (*cf.* `\cs_set:Npn`). The conditionals created are dependent on the comma-separated list of `<conditions>`, which should be one or more of T, F and TF, and for non-protected conditionals `p`. For public conditionals, a full set of forms should be provided: this contrasts with strictly internal conditionals, where only the required subset need be defined.

The conditionals are defined by `\prg_new_conditional:Npnn` and friends as:

- `\<name>_p:\<arg spec>` — a predicate function which will supply either a logical **true** or logical **false**. This function is intended for use in cases where one or more logical tests are combined to lead to a final outcome. This function cannot be defined for **protected** conditionals.
- `\<name>:\<arg spec>T` — a function with one more argument than the original `<arg spec>` demands. The `<true branch>` code in this additional argument will be left on the input stream only if the test is **true**.
- `\<name>:\<arg spec>F` — a function with one more argument than the original `<arg spec>` demands. The `<false branch>` code in this additional argument will be left on the input stream only if the test is **false**.
- `\<name>:\<arg spec>TF` — a function with two more argument than the original `<arg spec>` demands. The `<true branch>` code in the first additional argument will be left on the input stream if the test is **true**, while the `<false branch>` code in the second argument will be left on the input stream if the test is **false**.

The `<code>` of the test may use `<parameters>` as specified by the second argument to `\prg_set_conditional:Npnn`: this should match the `<argument specification>` but this is not enforced. The **Nnn** versions infer the number of arguments from the argument specification given (*cf.* `\cs_new:Nn`, etc.). Within the `<code>`, the functions `\prg_return_true:` and `\prg_return_false:` are used to indicate the logical outcomes of the test.

An example can easily clarify matters here:

```

\prg_set_conditional:Npnn \foo_if_bar:NN #1#2 { p , T , TF }
{
  \if_meaning:w \l_tmpa_tl #1
  \prg_return_true:
\else:
  \if_meaning:w \l_tmpa_tl #2
  \prg_return_true:
\else:
  \prg_return_false:
\fi:
\fi:
}

```

This defines the function `\foo_if_bar_p:NN`, `\foo_if_bar:NNTF` and `\foo_if_bar:NNT` but not `\foo_if_bar:NNF` (because F is missing from the `<conditions>` list). The return statements take care of resolving the remaining `\else:` and `\fi:` before returning the state. There must be a return statement for each branch; failing to do so will result in erroneous output if that branch is executed.

The special case where the code of a conditional ends with `\prg_return_true:` `\else:` `\prg_return_false:` `\fi:` is optimized.

---

```

\prg_new_eq_conditional:NNn \prg_new_eq_conditional:NNn \<name1>:<arg spec> \<name2>:<arg spec> {\<conditions>}
\prg_set_eq_conditional:NNn
\prg_gset_eq_conditional:NNn

```

---

Updated: 2023-05-26

These functions copy a family of conditionals. The **new** version checks for existing definitions (*cf.* `\cs_new_eq:NN`) whereas the **set** version does not (*cf.* `\cs_set_eq:NN`). The conditionals copied are depended on the comma-separated list of `<conditions>`, which should be one or more of `p`, `T`, `F` and `TF`.

---

```

\prg_return_true:  * \prg_return_true:
\prg_return_false: * \prg_return_false:

```

---

These “return” functions define the logical state of a conditional statement. They appear within the code for a conditional function generated by `\prg_set_conditional:Npnn`, *etc.*, to indicate when a true or false branch should be taken. While they may appear multiple times each within the code of such conditionals, the execution of the conditional must result in the expansion of one of these two functions *exactly once*.

The return functions trigger what is internally an **f**-expansion process to complete the evaluation of the conditional. Therefore, after `\prg_return_true:` or `\prg_return_false:` there must be no non-expandable material in the input stream for the remainder of the expansion of the conditional code. This includes other instances of either of these functions.

---

<code>\prg_generate_conditional_variant:Nnn</code>	<code>\prg_generate_conditional_variant:Nnn \&lt;name&gt;:\&lt;arg spec&gt; {\&lt;variant argument specifiers&gt;} {\&lt;condition specifiers&gt;}</code>
--	---

---

New: 2017-12-12

Defines argument-specifier variants of conditionals. This is equivalent to running `\cs_generate_variant:Nn <conditional> {\<variant argument specifiers>}` on each `<conditional>` described by the `<condition specifiers>`. These base-form `<conditionals>` are obtained from the `<name>` and `<arg spec>` as described for `\prg_new_conditional:Npmn`, and they should be defined.

## 9.2 The boolean data type

This section describes a boolean data type which is closely connected to conditional processing as sometimes you want to execute some code depending on the value of a switch (*e.g.*, draft/final) and other times you perhaps want to use it as a predicate function in an `\if_predicate:w` test. The problem of the primitive `\if_false:` and `\if_true:` tokens is that it is not always safe to pass them around as they may interfere with scanning for termination of primitive conditional processing. Therefore, we employ two canonical booleans: `\c_true_bool` or `\c_false_bool`. Besides preventing problems as described above, it also allows us to implement a simple boolean parser supporting the logical operations And, Or, Not, etc. which can then be used on both the boolean type and predicate functions.

All conditional `\bool_` functions except assignments are expandable and expect the input to also be fully expandable (which generally means being constructed from predicate functions and booleans, possibly nested).

**T<sub>E</sub>Xhackers note:** The `bool` data type is not implemented using the `\iffalse/\iftrue` primitives, in contrast to `\newif`, etc., in plain T<sub>E</sub>X, L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and so on. Programmers should not base use of `bool` switches on any particular expectation of the implementation.

---

<code>\bool_new:N</code>	<code>\bool_new:N &lt;boolean&gt;</code>
--------------------------	--

---

`\bool_new:c` Creates a new `<boolean>` or raises an error if the name is already taken. The declaration is global. The `<boolean>` is initially `false`.

---

<code>\bool_const:Nn</code>	<code>\bool_const:Nn &lt;boolean&gt; {\&lt;boolexpr&gt;}</code>
-----------------------------	---

---

`\bool_const:cn` Creates a new constant `<boolean>` or raises an error if the name is already taken. The value of the `<boolean>` is set globally to the result of evaluating the `<boolexpr>`.

### 9.2.1 Constant and scratch booleans

---

<code>\c_true_bool</code>	Constants that represent <code>true</code> and <code>false</code> , respectively. Used to implement predicates.
<code>\c_false_bool</code>	

---

---

<code>\l_tmpa_bool</code>	A scratch boolean for local assignment. It is never used by the kernel code, and so is safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_bool</code>	

---

---

<code>\g_tmpa_bool</code>	A scratch boolean for global assignment. It is never used by the kernel code, and so is safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_bool</code>	

---

## 9.3 Boolean expressions

As we have a boolean datatype and predicate functions returning boolean  $\langle \textit{true} \rangle$  or  $\langle \textit{false} \rangle$  values, it seems only fitting that we also provide a parser for  $\langle \textit{boolean expressions} \rangle$ .

A boolean expression is an expression which given input in the form of predicate functions and boolean variables, return boolean  $\langle \textit{true} \rangle$  or  $\langle \textit{false} \rangle$ . It supports the logical operations And, Or and Not as the well-known infix operators `&&` and `||` and prefix `!` with their usual precedences (namely, `&&` binds more tightly than `||`). In addition to this, parentheses can be used to isolate sub-expressions. For example,

```
\int_compare_p:n { 1 = 1 } &&
(
  \int_compare_p:n { 2 = 3 } ||
  \int_compare_p:n { 4 <= 4 } ||
  \str_if_eq_p:nn { abc } { def }
) &&
! \int_compare_p:n { 2 = 4 }
```

is a valid boolean expression.

Contrarily to some other programming languages, the operators `&&` and `||` evaluate both operands in all cases, even when the first operand is enough to determine the result. This “eager” evaluation should be contrasted with the “lazy” evaluation of `\bool_lazy_...` functions.

**T<sub>E</sub>Xhackers note:** The eager evaluation of boolean expressions is unfortunately necessary in T<sub>E</sub>X. Indeed, a lazy parser can get confused if `&&` or `||` or parentheses appear as (unbraced)

arguments of some predicates. For instance, the innocuous-looking expression below would break (in a lazy parser) if #1 were a closing parenthesis and \l\_tmpa\_bool were true.

```
( \l_tmpa_bool || \token_if_eq_meaning_p:NN X #1 )
```

Minimal (lazy) evaluation can be obtained using the conditionals \bool\_lazy\_all:nTF, \bool\_lazy\_and:nnTF, \bool\_lazy\_any:nTF, or \bool\_lazy\_or:nnTF, which only evaluate their boolean expression arguments when they are needed to determine the resulting truth value. For example, when evaluating the boolean expression

```
\bool_lazy_and_p:nn
{
  \bool_lazy_any_p:n
  {
    { \int_compare_p:n { 2 = 3 } }
    { \int_compare_p:n { 4 <= 4 } }
    { \int_compare_p:n { 1 = \error } } % skipped
  }
}
{ ! \int_compare_p:n { 2 = 4 } }
```

the line marked with `skipped` is not expanded because the result of \bool\_lazy\_any\_p:n is known once the second boolean expression is found to be logically true. On the other hand, the last line is expanded because its logical value is needed to determine the result of \bool\_lazy\_and\_p:nn.

---

```
\bool_if_p:n * \bool_if_p:n {<boolean expression>}
\bool_if:nTF * \bool_if:nTF {<boolean expression>} {<true code>} {<false code>}
```

---

Updated: 2017-07-15 Tests the current truth of <boolean expression>, and continues expansion based on this result. The <boolean expression> should consist of a series of predicates or boolean variables with the logical relationship between these defined using && (“And”), || (“Or”), ! (“Not”) and parentheses. The logical Not applies to the next predicate or group.

---

```
\bool_lazy_all_p:n * \bool_lazy_all_p:n { {<boolexpr1>} {<boolexpr2>} ... {<boolexprN>} }
\bool_lazy_all:nTF * \bool_lazy_all:nTF { {<boolexpr1>} {<boolexpr2>} ... {<boolexprN>} } {<true code>}
{<false code>}
```

---

New: 2015-11-15  
Updated: 2017-07-15 Implements the “And” operation on the <boolean expressions>, hence is true if all of them are true and false if any of them is false. Contrarily to the infix operator &&, only the <boolean expressions> which are needed to determine the result of \bool\_lazy\_all:nTF are evaluated. See also \bool\_lazy\_and:nnTF when there are only two <boolean expressions>.

---

```
\bool_lazy_and_p:nn * \bool_lazy_and_p:nn {<boolexpr1>} {<boolexpr2>}
\bool_lazy_and:nnTF * \bool_lazy_and:nnTF {<boolexpr1>} {<boolexpr2>} {<true code>} {<false code>}
```

---

New: 2015-11-15  
Updated: 2017-07-15 Implements the “And” operation between two boolean expressions, hence is true if both are true. Contrarily to the infix operator &&, the <boolexpr2> is only evaluated if it is needed to determine the result of \bool\_lazy\_and:nnTF. See also \bool\_lazy\_all:nTF when there are more than two <boolean expressions>.

<hr/>

The process then loops until the <code>&lt;boolean expression&gt;</code> is <code>false</code> .

<hr/>	<code>\bool_case:n</code>	<code>*</code>	<code>\bool_case:nTF</code>
<hr/>	<code>\bool_case:nTF</code>	<code>*</code>	<pre> {   {\langle boolexpr case_1 \rangle} {\langle code case_1 \rangle}   {\langle boolexpr case_2 \rangle} {\langle code case_2 \rangle}   ...   {\langle boolexpr case_n \rangle} {\langle code case_n \rangle} } {\langle true code \rangle} {\langle false code \rangle} </pre>
<hr/>	New: 2023-05-03		
<hr/>			

Evaluates in turn each of the *boolean expression case*s until the first one that evaluates to **true**. The *code* associated to this first case is left in the input stream, followed by the *true code*, and other cases are discarded. If none of the cases match then only the *false code* is inserted. The function `\bool_case:n`, which does nothing if there is no match, is also available. For example

```

\bool_case:nF
{
  { \dim_compare_p:n { \l__mypkg_wd_dim <= 10pt } }
    { Fits }
  { \int_compare_p:n { \l__mypkg_total_int >= 10 } }
    { Many }
  { \l__mypkg_special_bool }
    { Special }
}
{ No idea! }

```

leaves “Fits” or “Many” or “Special” or “No idea!” in the input stream, in a way similar to some other language’s “if ... elseif ... elseif ... else ...”.

## 9.5 Producing multiple copies

<hr/>	<code>\prg_replicate:nn</code>	<code>*</code>	<code>\prg_replicate:nn {\langle integer expression \rangle} {\langle tokens \rangle}</code>
-------	--------------------------------	----------------	--

Updated: 2011-07-04

Evaluates the *integer expression* (which should be zero or positive) and creates the resulting number of copies of the *tokens*. The function is both expandable and safe for nesting. It yields its result after two expansion steps.

## 9.6 Detecting T<sub>E</sub>X’s mode

<hr/>	<code>\mode_if_horizontal_p:</code>	<code>*</code>	<code>\mode_if_horizontal_p:</code>
<hr/>	<code>\mode_if_horizontal:TF</code>	<code>*</code>	<code>\mode_if_horizontal:TF {\langle true code \rangle} {\langle false code \rangle}</code>

Detects if T<sub>E</sub>X is currently in horizontal mode.

<hr/>	<code>\mode_if_inner_p:</code>	<code>*</code>	<code>\mode_if_inner_p:</code>
<hr/>	<code>\mode_if_inner:TF</code>	<code>*</code>	<code>\mode_if_inner:TF {\langle true code \rangle} {\langle false code \rangle}</code>

Detects if T<sub>E</sub>X is currently in inner mode.

---

<code>\mode_if_math_p: *</code>	<code>\mode_if_math_p:</code>
<code>\mode_if_math:TF *</code>	<code>\mode_if_math:TF {\true code} {\false code}</code>

---

Updated: 2011-09-05 Detects if T<sub>E</sub>X is currently in maths mode.

---

---

<code>\mode_if_vertical_p: *</code>	<code>\mode_if_vertical_p:</code>
<code>\mode_if_vertical:TF *</code>	<code>\mode_if_vertical:TF {\true code} {\false code}</code>

---

Detects if T<sub>E</sub>X is currently in vertical mode.

---

## 9.7 Primitive conditionals

---

<code>\if_predicate:w *</code>	<code>\if_predicate:w &lt;predicate&gt; &lt;true code&gt; \else: &lt;false code&gt; \fi:</code>
--------------------------------	---

---

This function takes a predicate function and branches according to the result. (In practice this function would also accept a single boolean variable in place of the `<predicate>` but to make the coding clearer this should be done through `\if_bool:N`.)

---

<code>\if_bool:N *</code>	<code>\if_bool:N &lt;boolean&gt; &lt;true code&gt; \else: &lt;false code&gt; \fi:</code>
---------------------------	--

---

This function takes a boolean variable and branches according to the result.

---

## 9.8 Nestable recursions and mappings

There are a number of places where recursion or mapping constructs are used in expl3. At a low-level, these typically require insertion of tokens at the end of the content to allow “clean up”. To support such mappings in a nestable form, the following functions are provided.

---

<code>\prg_break_point:Nn *</code>	<code>\prg_break_point:Nn \&lt;type&gt;_map_break: {\code}</code>
------------------------------------	---

---

New: 2018-03-26 Used to mark the end of a recursion or mapping: the functions `\<type>_map_break:` and `\<type>_map_break:n` use this to break out of the loop (see `\prg_map_break:Nn` for how to set these up). After the loop ends, the `<code>` is inserted into the input stream. This occurs even if the break functions are *not* applied: `\prg_break_point:Nn` is functionally-equivalent in these cases to `\use_ii:nn`.

---

---

<code>\prg_map_break:Nn *</code>	<code>\prg_map_break:Nn \&lt;type&gt;_map_break: {\user code}</code>
	<code>...</code>

---

New: 2018-03-26 `\prg_break_point:Nn \<type>_map_break: {\ending code}`

Breaks a recursion in mapping contexts, inserting in the input stream the `<user code>` after the `<ending code>` for the loop. The function breaks loops, inserting their `<ending code>`, until reaching a loop with the same `<type>` as its first argument. This `\<type>_map_break:` argument must be defined; it is simply used as a recognizable marker for the `<type>`.

For types with mappings defined in the kernel, `\<type>_map_break:` and `\<type>_map_break:n` are defined as `\prg_map_break:Nn \<type>_map_break: {}` and the same with `{}` omitted.

### 9.8.1 Simple mappings

In addition to the more complex mappings above, non-nestable mappings are used in a number of locations and support is provided for these.

---

<code>\prg_break_point:</code>	★	This copy of <code>\prg_do_nothing:</code> is used to mark the end of a fast short-term recursion:
		the function <code>\prg_break:n</code> uses this to break out of the loop.

---

New: 2018-03-27

---

<code>\prg_break:</code>	★	<code>\prg_break:n {&lt;code&gt;} ... \prg_break_point:</code>
<code>\prg_break:n</code>	★	Breaks a recursion which has no <i>&lt;ending code&gt;</i> and which is not a user-breakable mapping (see for instance implementation of <code>\int_step_function:nnnN</code> ), and inserts the <i>&lt;code&gt;</i> in the input stream.

---

New: 2018-03-27

## 9.9 Internal programming functions

---

<code>\group_align_safe_begin:</code>	★	<code>\group_align_safe_begin:</code>
<code>\group_align_safe_end:</code>	★	...

---

Updated: 2011-08-11

`\group_align_safe_end:`

These functions are used to enclose material in a  $\TeX$  alignment environment within a specially-constructed group. This group is designed in such a way that it does not add brace groups to the output but does act as a group for the `&` token inside `\halign`. This is necessary to allow grabbing of tokens for testing purposes, as  $\TeX$  uses group level to determine the effect of alignment tokens. Without the special grouping, the use of a function such as `\peek_after:Nw` would result in a forbidden comparison of the internal `\endtemplate` token, yielding a fatal error. Each `\group_align_safe_begin:` must be matched by a `\group_align_safe_end:`, although this does not have to occur within the same function.

## Chapter 10

# The l3sys module

## System/runtime functions

### 10.1 The name of the job

---

`\c_sys_jobname_str`

Constant that gets the “job name” assigned when T<sub>E</sub>X starts.

New: 2015-09-19  
Updated: 2019-10-27

---

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\jobname`. For technical reasons, the string here is not of the same internal form as other, but may be manipulated using normal string functions.

### 10.2 Date and time

---

`\c_sys_minute_int`  
`\c_sys_hour_int`  
`\c_sys_day_int`  
`\c_sys_month_int`  
`\c_sys_year_int`

---

The date and time at which the current job was started: these are all reported as integers.

**T<sub>E</sub>Xhackers note:** Whilst the underlying T<sub>E</sub>X primitives `\time`, `\day`, `\month`, and `\year` can be altered by the user, this interface to the time and date is intended to be the “real” values.

New: 2015-09-22

---

---

`\c_sys_timestamp_str`

---

The timestamp for the current job: the format is as described for `\file_timestamp:n`.

New: 2023-08-27

---

## 10.3 Engine

---

```

\sys_if_engine luatex_p: * \sys_if_engine pdftex_p:
\sys_if_engine luatex:TF * \sys_if_engine pdftex:TF {\true code} {\false code}
\sys_if_engine pdftex_p: * Conditionals which allow engine-specific code to be used. The names follow naturally
\sys_if_engine pdftex:TF * from those of the engine binaries: note that the (u)ptex tests are for  $\varepsilon$ -pTeX and  $\varepsilon$ -upTeX
\sys_if_engine ptex_p: * as expl3 requires the  $\varepsilon$ -TeX extensions. Each conditional is true for exactly one supported
\sys_if_engine ptex:TF * engine. In particular, \sys_if_engine ptex_p: is true for  $\varepsilon$ -pTeX but false for  $\varepsilon$ -upTeX.
\sys_if_engine uptex_p: *
\sys_if_engine uptex:TF *
\sys_if_engine xetex_p: *
\sys_if_engine xetex:TF *

```

---

New: 2015-09-07

---

---

```

\sys_if_engine opentype_p: * \sys_if_engine opentype_p:
\sys_if_engine opentype:TF * \sys_if_engine opentype:TF {\true code} {\false code}

```

---

New: 2024-11-05

---

Conditional which allows functionality-specific code to be used. The test is true for engines which can use OpenType fonts and thus full Unicode typesetting. This tests for features not engine name, but currently is equivalent to requiring either XeTeX or LuaTeX.

**TeXhackers note:** The underlying test here checks for `\Umathcode`, which is used to implement OpenType math font typesetting. Any engine which should give a `true` result here needs to provide general Unicode support (accepting the full UTF-8 range for character codes), a mechanism to load system fonts and a suitable interface for math mode typesetting.

---

```

\c_sys_engine_str

```

---

New: 2015-09-19

---

The current engine given as a lower case string: one of `luatex`, `pdftex`, `ptex`, `uptex` or `xetex`.

---

```

\c_sys_engine_exec_str

```

---

New: 2020-08-20

---

The name of the standard executable for the current TeX engine given as a lower case string: one of `luatex`, `luahtex`, `pdftex`, `eptex`, `euptex` or `xetex`.

---

```

\c_sys_engine_format_str

```

---

New: 2020-08-20

---

The name of the preloaded format for the current TeX run given as a lower case string: one of `lualatex` (or `dvilualatex`), `pdflatex` (or `latex`), `platex`, `uplatex` or `xelatex` for L<sup>A</sup>TeX, similar names for plain TeX (except pdfTeX in DVI mode yields `etex`), and `cont-en` for ConTeXt (i.e., the `\fmtname`).

<hr/> <code>\c_sys_engine_version_str</code> <hr/>	The version string of the current engine, in the same form as given in the banner issued when running a job. For pdfTeX and LuaTeX this is of the form
--	--

$\langle major \rangle . \langle minor \rangle . \langle revision \rangle$

For XeTeX, the form is

$\langle major \rangle . \langle minor \rangle$

For pTeX and upTeX, only releases since TeX Live 2018 make the data available, and the form is more complex, as it comprises the pTeX version, the upTeX version and the e-pTeX version.

$p \langle major \rangle . \langle minor \rangle . \langle revision \rangle - u \langle major \rangle . \langle minor \rangle - \langle epTeX \rangle$

where the *u* part is only present for upTeX.

<hr/> <code>\sys_timer: *</code> <hr/>	<code>\sys_timer:</code>
<hr/> <small>New: 2021-05-12</small> <hr/>	Expands to the current value of the engine's timer clock, a non-negative integer. This function is only defined for engines with timer support. This command measures not just CPU time but real time (including time waiting for user input). The unit are scaled seconds ( $2^{-16}$ seconds).

## 10.4 Output format

In L<sup>A</sup>T<sub>E</sub>X, the output format may be set in the preamble: as such, expl3 delays setting the information here until either

- `\sys_ensure_backend:` or `\sys_load_backend:n` are used
- `\begin{document}` is reached

<hr/> <code>\sys_if_output_dvi_p: *</code> <hr/>	<code>\sys_if_output_dvi_p:</code>
<code>\sys_if_output_dvi:TF *</code>	<code>\sys_if_output_dvi:TF {\true code} {\false code}</code>
<hr/> <code>\sys_if_output_pdf_p: *</code> <hr/>	Conditionals which give the current output mode the TeX run is operating in. This is always one of two outcomes, DVI mode or PDF mode. The two sets of conditionals are thus complementary and are both provided to allow the programmer to emphasise the most appropriate case.
<hr/> <small>New: 2015-09-19</small> <hr/>	

<hr/> <code>\c_sys_output_str</code> <hr/>	The current output mode given as a lower case string: one of <code>dvi</code> or <code>pdf</code> .
<hr/> <small>New: 2015-09-19</small> <hr/>	

## 10.5 Platform

---

<code>\sys_if_platform_unix_p:</code>	<code>*</code>	<code>\sys_if_platform_unix_p:</code>
<code>\sys_if_platform_unix:TF</code>	<code>*</code>	<code>\sys_if_platform_unix:TF</code> <code>{\langle true code \rangle}</code> <code>{\langle false code \rangle}</code>
<code>\sys_if_platform_windows_p:</code>	<code>*</code>	
<code>\sys_if_platform_windows:TF</code>	<code>*</code>	

---

New: 2018-07-27

Conditionals which allow platform-specific code to be used. The names follow the Lua `os.type()` function, i.e., all Unix-like systems are `unix` (including Linux and MacOS).

---

<code>\c_sys_platform_str</code>	The current platform given as a lower case string: one of <code>unix</code> , <code>windows</code> or <code>unknown</code> .
----------------------------------	--

---

New: 2018-07-27

## 10.6 Random numbers

---

<code>\sys_rand_seed:</code>	<code>*</code>	<code>\sys_rand_seed:</code>
------------------------------	----------------	------------------------------

---

New: 2017-05-27

Expands to the current value of the engine's random seed, a non-negative integer. In engines without random number support this expands to 0.

---

<code>\sys_gset_rand_seed:n</code>	<code>\sys_gset_rand_seed:n</code> <code>{\langle int expr \rangle}</code>
------------------------------------	--

---

New: 2017-05-27

Globally sets the seed for the engine's pseudo-random number generator to the *integer expression*. This random seed affects all `\..._rand` functions (such as `\int_rand:nn` or `\clist_rand_item:n`) as well as other packages relying on the engine's random number generator. In engines without random number support this produces an error.

**TeXhackers note:** While a 32-bit (signed) integer can be given as a seed, only the absolute value is used and any number beyond  $2^{28}$  is divided by an appropriate power of 2. We recommend using an integer in  $[0, 2^{28} - 1]$ .

## 10.7 Access to the shell

---

<code>\sys_get_shell:nnN</code>	<code>\sys_get_shell:nnN {&lt;shell command&gt;} {&lt;setup&gt;} &lt;t1 var&gt;</code>
<code>\sys_get_shell:nnNTF</code>	<code>\sys_get_shell:nnNTF {&lt;shell command&gt;} {&lt;setup&gt;} &lt;t1 var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2019-09-20

Defines `<t1 var>` to the text returned by the `<shell command>`. The `<shell command>` is converted to a string using `\tl_to_str:n`. Category codes may need to be set appropriately via the `<setup>` argument, which is run just before running the `<shell command>` (in a group). If shell escape is disabled, the `<t1 var>` will be set to `\q_no_value` in the non-branching version. Note that quote characters (") *cannot* be used inside the `<shell command>`. The `\sys_get_shell:nnNTF` conditional inserts the `<true code>` if the shell is available and no quote is detected, and the `<false code>` otherwise.

*Note:* It is not possible to tell from TeX if a command is allowed in restricted shell escape. If restricted escape is enabled, the `true` branch is taken: if the command is forbidden at this stage, a low-level TeX error will arise.

---

<code>\c_sys_shell_escape_int</code>	This variable exposes the internal triple of the shell escape status. The possible values are
--------------------------------------	---

---

New: 2017-05-27

- 0** Shell escape is disabled
- 1** Unrestricted shell escape is enabled
- 2** Restricted shell escape is enabled

---

<code>\sys_if_shell_p: *</code>	<code>\sys_if_shell_p:</code>
<code>\sys_if_shell:TF *</code>	<code>\sys_if_shell:TF {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2017-05-27

Performs a check for whether shell escape is enabled. This returns true if either of restricted or unrestricted shell escape is enabled.

---

<code>\sys_if_shell_unrestricted_p: *</code>	<code>\sys_if_shell_unrestricted_p:</code>
<code>\sys_if_shell_unrestricted:TF *</code>	<code>\sys_if_shell_unrestricted:TF {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2017-05-27

Performs a check for whether *unrestricted* shell escape is enabled.

---

<code>\sys_if_shell_restricted_p: *</code>	<code>\sys_if_shell_restricted_p:</code>
<code>\sys_if_shell_restricted:TF *</code>	<code>\sys_if_shell_restricted:TF {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2017-05-27

Performs a check for whether *restricted* shell escape is enabled. This returns false if unrestricted shell escape is enabled. Unrestricted shell escape is not considered a superset of restricted shell escape in this case. To find whether any shell escape is enabled use `\sys_if_shell:TF`.

---

<code>\sys_shell_now:n</code>	<code>\sys_shell_now:n {&lt;tokens&gt;}</code>
<code>\sys_shell_now:e</code>	Execute <code>&lt;tokens&gt;</code> through shell escape immediately.

---

New: 2017-05-27

---

<code>\sys_shell_shipout:n</code>	<code>\sys_shell_shipout:n {&lt;tokens&gt;}</code>
<code>\sys_shell_shipout:e</code>	Execute <code>&lt;tokens&gt;</code> through shell escape at shipout.
New: 2017-05-27	

---

## 10.8 System queries

Some queries can be made about the file system, etc., without needing to use unrestricted shell escape. This is carried out using the script `l3sys-query`, which is documented separately. The wrappers here use this script, if available, to obtain system information that is not directly available within the  $\TeX$  run. Note that if restricted shell escape is disabled, no results can be obtained.

---

<code>\sys_get_query:nN</code>	<code>\sys_get_query:nN {&lt;cmd&gt;} &lt;tl var&gt;</code>
<code>\sys_get_query:nnN</code>	<code>\sys_get_query:nnN {&lt;cmd&gt;} {&lt;spec&gt;} &lt;tl var&gt;</code>
<code>\sys_get_query:nnnN</code>	<code>\sys_get_query:nnnN {&lt;cmd&gt;} {&lt;options&gt;} {&lt;spec&gt;} &lt;tl var&gt;</code>
New: 2024-03-08	
Updated: 2024-04-08	

---

Sets the `<tl var>` to the information returned by the `l3sys-query <cmd>`, potentially supplying the `<options>` and `<spec>` to the query call. The valid `<cmd>` names are at present

- `pwd` Returns the present working directory
- `ls` Returns a directory listing, using the `<spec>` to select files and applying the `<options>` if given

The `<spec>` is likely to contain the wildcards `*` or `?`, and will automatically be passed to the script without shell expansion. In a glob is needed within the `<options>`, this will need to be protected from shell expansion using `'` tokens.

The `<spec>` and `<options>`, if given, are expanded fully before passing to the underlying script.

Spaces in the output are stored as active tokens, allowing them to be replaced by for example a visible space easily. Other non-letter characters in the ASCII range are set to category code 12. The category codes for characters out of the ASCII range are left unchanged: typically this will mean that with an 8-bit engine, accented values can be typeset directly whilst in Unicode engines, standard category code setup will apply.

If more than one line of text is returned by the `<cmd>`, these will be separated by character 13 (`^^M`) tokens of category code 12. In most cases, `\sys_split_query:nnnN` should be preferred when multi-line output is expected.

---

<code>\sys_split_query:nN</code>	<code>\sys_split_query:nN {&lt;cmd&gt;} &lt;seq var&gt;</code>
<code>\sys_split_query:nnN</code>	<code>\sys_split_query:nnN {&lt;cmd&gt;} {&lt;spec&gt;} &lt;seq var&gt;</code>
<code>\sys_split_query:nnnN</code>	<code>\sys_split_query:nnnN {&lt;cmd&gt;} {&lt;options&gt;} {&lt;spec&gt;} &lt;seq var&gt;</code>
New: 2024-03-08	

---

Works as described for `\sys_split_query:nnnN`, but sets the `<seq var>` to contain one entry for each line returned by `l3sys-query`. This function should therefore be preferred where multi-line return is expected, e.g. for the `ls` command.

## 10.9 Loading configuration data

<hr/> <code>\sys_load_backend:n</code> <hr/>	<code>\sys_load_backend:n {&lt;backend&gt;}</code>
<hr/> <small>New: 2019-09-12</small> <hr/>	Loads the additional configuration file needed for backend support. If the <code>&lt;backend&gt;</code> is empty, the standard backend for the engine in use will be loaded. This command may only be used once.
<hr/> <code>\sys_ensure_backend:</code> <hr/>	<code>\sys_ensure_backend:</code>
<hr/> <small>New: 2022-07-29</small> <hr/>	Ensures that a backend has been loaded by calling <code>\sys_load_backend:n</code> if required.
<hr/> <code>\c_sys_backend_str</code> <hr/>	Set to the name of the backend in use by <code>\sys_load_backend:n</code> when issued. Possible values are <ul style="list-style-type: none"><li>• <code>pdftex</code></li><li>• <code>luatex</code></li><li>• <code>xetex</code></li><li>• <code>dvips</code></li><li>• <code>dvipdfmx</code></li><li>• <code>dvisvgm</code></li></ul>
<hr/> <code>\sys_load_debug:</code> <hr/>	<code>\sys_load_debug:</code>
<hr/> <small>New: 2019-09-12</small> <hr/>	Load the additional configuration file for debugging support.

### 10.9.1 Final settings

<hr/> <code>\sys_finalise:</code> <hr/>	<code>\sys_finalise:</code>
<hr/> <small>New: 2019-10-06</small> <hr/>	Finalises all system-dependent functionality: required before loading a backend.

## Chapter 11

# The l3msg module

## Messages

Messages need to be passed to the user by modules, either when errors occur or to indicate how the code is proceeding. The `l3msg` module provides a consistent method for doing this (as opposed to writing directly to the terminal or log).

The system used by `l3msg` to create messages divides the process into two distinct parts. Named messages are created in the first part of the process; at this stage, no decision is made about the type of output that the message will produce. The second part of the process is actually producing a message. At this stage a choice of message *class* has to be made, for example `error`, `warning` or `info`.

By separating out the creation and use of messages, several benefits are available. First, the messages can be altered later without needing details of where they are used in the code. This makes it possible to alter the language used, the detail level and so on. Secondly, the output which results from a given message can be altered. This can be done on a message class, module or message name basis. In this way, message behaviour can be altered and messages can be entirely suppressed.

### 11.1 Creating new messages

All messages have to be created before they can be used. The text of messages is automatically wrapped to the length available in the console. As a result, formatting is only needed where it helps to show meaning. In particular, `\\` may be used to force a new line and `\_` forces an explicit space. Additionally, `\{`, `\#`, `\}`, `\%` and `\~` can be used to produce the corresponding character.

Messages may be subdivided *by one level* using the `/` character. This is used within the message filtering system to allow for example the L<sup>A</sup>T<sub>E</sub>X kernel messages to belong to the module `LaTeX` while still being filterable at a more granular level. Thus for example

```
\msg_new:nnnn { mymodule } { submodule / message } ...
```

will allow to filter out specifically messages from the `submodule`.

Some authors may find the need to include spaces as `~` characters tedious. This can be avoided by locally resetting the category code of `_`.

```

\char_set_catcode_space:n { '\ }
\msg_new:nnn { foo } { bar }
    {Some message text using '#1' and usual message shorthands \{ \ \ \}.}
\char_set_catcode_ignore:n { '\ }

```

although in general this may be confusing; simply writing the messages using `~` characters is the method favored by the team.

---

<code>\msg_new:nnnn</code> <code>\msg_new:nnee</code> <code>\msg_new:nnn</code> <code>\msg_new:nne</code> <hr/> Updated: 2011-08-16	<code>\msg_new:nnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;text&gt;} {&lt;more text&gt;}</code> Creates a <code>&lt;message&gt;</code> for a given <code>&lt;module&gt;</code> . The message is defined to first give <code>&lt;text&gt;</code> and then <code>&lt;more text&gt;</code> if the user requests it. If no <code>&lt;more text&gt;</code> is available then a standard text is given instead. Within <code>&lt;text&gt;</code> and <code>&lt;more text&gt;</code> four parameters ( <code>#1</code> to <code>#4</code> ) can be used: these will be supplied at the time the message is used. An error is raised if the <code>&lt;message&gt;</code> already exists.
---	--

---

<code>\msg_set:nnnn</code> <code>\msg_set:nnn</code> <hr/>	<code>\msg_set:nnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;text&gt;} {&lt;more text&gt;}</code> Sets up the text for a <code>&lt;message&gt;</code> for a given <code>&lt;module&gt;</code> . The message is defined to first give <code>&lt;text&gt;</code> and then <code>&lt;more text&gt;</code> if the user requests it. If no <code>&lt;more text&gt;</code> is available then a standard text is given instead. Within <code>&lt;text&gt;</code> and <code>&lt;more text&gt;</code> four parameters ( <code>#1</code> to <code>#4</code> ) can be used: these will be supplied at the time the message is used.
--	--

---

<code>\msg_if_exist_p:nn *</code> <code>\msg_if_exist:nnTF *</code> <hr/> New: 2012-03-03	<code>\msg_if_exist_p:nn {&lt;module&gt;} {&lt;message&gt;}</code> <code>\msg_if_exist:nnTF {&lt;module&gt;} {&lt;message&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code> Tests whether the <code>&lt;message&gt;</code> for the <code>&lt;module&gt;</code> is currently defined.
---	---

## 11.2 Customizable information for message modules

---

<code>\msg_module_name:n *</code> <hr/> New: 2018-10-10	<code>\msg_module_name:n {&lt;module&gt;}</code> Expands to the public name of the <code>&lt;module&gt;</code> as defined by <code>\g_msg_module_name_prop</code> (or otherwise leaves the <code>&lt;module&gt;</code> unchanged).
--	---

---

<code>\msg_module_type:n *</code> <hr/> New: 2018-10-10	<code>\msg_module_type:n {&lt;module&gt;}</code> Expands to the description which applies to the <code>&lt;module&gt;</code> , for example a <code>Package</code> or <code>Class</code> . The information here is defined in <code>\g_msg_module_type_prop</code> , and will default to <code>Package</code> if an entry is not present.
--	---

---

<code>\g_msg_module_name_prop</code> <hr/> New: 2018-10-10	Provides a mapping between the module name used for messages, and that for documentation.
---	---

---

<code>\g_msg_module_type_prop</code> <hr/> New: 2018-10-10	Provides a mapping between the module name used for messages, and that type of module. For example, for L <sup>A</sup> T <sub>E</sub> X3 core messages, an empty entry is set here meaning that they are not described using the standard <code>Package</code> text.
---	--

## 11.3 Contextual information for messages

<hr/> <hr/>	<code>\msg_line_context: ☆ \msg_line_context:</code>
	Prints the current line number when a message is given, and thus suitable for giving context to messages. The number itself is preceded by the text <code>on line</code> .
<hr/> <hr/>	<code>\msg_line_number: ★ \msg_line_number:</code>
	Prints the current line number when a message is given.
<hr/> <hr/>	<code>\msg_fatal_text:n ★ \msg_fatal_text:n {⟨module⟩}</code>
	Produces the standard text
	<p style="text-align: center;">Fatal Package ⟨module⟩ Error</p> <p>This function can be redefined to alter the language in which the message is given, using #1 as the name of the ⟨module⟩ to be included. Any redefinition <i>must</i> produce output containing the ⟨module⟩ name, and will affect all messages using the <code>expl3</code> mechanism.</p>
<hr/> <hr/>	<code>\msg_critical_text:n ★ \msg_critical_text:n {⟨module⟩}</code>
	Produces the standard text
	<p style="text-align: center;">Critical Package ⟨module⟩ Error</p> <p>This function can be redefined to alter the language in which the message is given, using #1 as the name of the ⟨module⟩ to be included. Any redefinition <i>must</i> produce output containing the ⟨module⟩ name, and will affect all messages using the <code>expl3</code> mechanism.</p>
<hr/> <hr/>	<code>\msg_error_text:n ★ \msg_error_text:n {⟨module⟩}</code>
	Produces the standard text
	<p style="text-align: center;">Package ⟨module⟩ Error</p> <p>This function can be redefined to alter the language in which the message is given, using #1 as the name of the ⟨module⟩ to be included. Any redefinition <i>must</i> produce output containing the ⟨module⟩ name, and will affect all messages using the <code>expl3</code> mechanism.</p>
<hr/> <hr/>	<code>\msg_warning_text:n ★ \msg_warning_text:n {⟨module⟩}</code>
	Produces the standard text
	<p style="text-align: center;">Package ⟨module⟩ Warning</p> <p>This function can be redefined to alter the language in which the message is given, using #1 as the name of the ⟨module⟩ to be included. The ⟨type⟩ of ⟨module⟩ may be adjusted: <code>Package</code> is the standard outcome: see <code>\msg_module_type:n</code>. Any redefinition <i>must</i> produce output containing the ⟨module⟩ name, and will affect all messages using the <code>expl3</code> mechanism.</p>

---

`\msg_info_text:n` \* `\msg_info_text:n {<module>}`

---

Produces the standard text:

Package `<module>` Info

This function can be redefined to alter the language in which the message is given, using `#1` as the name of the `<module>` to be included. The `<type>` of `<module>` may be adjusted: `Package` is the standard outcome: see `\msg_module_type:n`. Any redefinition *must* produce output containing the `<module>` name, and will affect all messages using the `expl3` mechanism.

---

`\msg_see_documentation_text:n` \* `\msg_see_documentation_text:n {<module>}`

---

Updated: 2018-09-30

Produces the standard text

See the `<module>` documentation for further information.

This function can be redefined to alter the language in which the message is given, using `#1` as the name of the `<module>` to be included. The name of the `<module>` is produced using `\msg_module_name:n`.

## 11.4 Issuing messages

Messages behave differently depending on the message class. In all cases, the message may be issued supplying 0 to 4 arguments. If the number of arguments supplied here does not match the number in the definition of the message, extra arguments are ignored, or empty arguments added (of course the sense of the message may be impaired). The four arguments are converted to strings before being added to the message text: the `e`-type variants should be used to expand material. Note that this expansion takes place with the standard definitions in effect, which means that shorthands such as `\~` or `\\` are *not* available; instead one should use `\iow_char:N \~` and `\iow_newline:`, respectively. The following message classes exist:

- `fatal`, ending the `TEX` run;
- `critical`, ending the file being input;
- `error`, interrupting the `TEX` run without ending it;
- `warning`, written to terminal and log file, for important messages that may require corrections by the user;
- `note` (less common than `info`) for important information messages written to the terminal and log file;
- `info` for normal information messages written to the log file only;
- `term` and `log` for un-decorated messages written to the terminal and log file, or to the log file only;
- `none` for suppressed messages.

---

<code>\msg_fatal:nnnnnn</code>	<code>\msg_fatal:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg</code>
<code>\msg_fatal:nneeee</code>	<code>three)} {&lt;arg four&gt;}</code>
<code>\msg_fatal:nnnnn</code>	
<code>\msg_fatal:(nneee nnnee)</code>	
<code>\msg_fatal:nnnn</code>	
<code>\msg_fatal:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_fatal:nnn</code>	
<code>\msg_fatal:(nnV nne)</code>	
<code>\msg_fatal:nn</code>	

---

Updated: 2012-08-11

Issues `<module>` error `<message>`, passing `<arg one>` to `<arg four>` to the text-creating functions. After issuing a fatal error the  $\text{\TeX}$  run halts. No PDF file will be produced in this case (DVI mode runs may produce a truncated DVI file).

---

<code>\msg_critical:nnnnnn</code>	<code>\msg_critical:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;}</code>
<code>\msg_critical:nneeee</code>	<code>{&lt;arg three&gt;} {&lt;arg four&gt;}</code>
<code>\msg_critical:nnnnn</code>	
<code>\msg_critical:(nneee nnnee)</code>	
<code>\msg_critical:nnnn</code>	
<code>\msg_critical:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_critical:nnn</code>	
<code>\msg_critical:(nnV nne)</code>	
<code>\msg_critical:nn</code>	

---

Updated: 2012-08-11

Issues `<module>` error `<message>`, passing `<arg one>` to `<arg four>` to the text-creating functions. After issuing a critical error,  $\text{\TeX}$  stops reading the current input file. This may halt the  $\text{\TeX}$  run (if the current file is the main file) or may abort reading a sub-file.

**$\text{\TeX}$ hackers note:** The  $\text{\TeX}$  `\endinput` primitive is used to exit the file. In particular, the rest of the current line remains in the input stream.

---

<code>\msg_error:nnnnnn</code>	<code>\msg_error:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg</code>
<code>\msg_error:nneeee</code>	<code>three)} {&lt;arg four&gt;}</code>
<code>\msg_error:nnnnn</code>	
<code>\msg_error:(nneee nnnee)</code>	
<code>\msg_error:nnnn</code>	
<code>\msg_error:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_error:nnn</code>	
<code>\msg_error:(nnV nne)</code>	
<code>\msg_error:nn</code>	

---

Updated: 2012-08-11

Issues `<module>` error `<message>`, passing `<arg one>` to `<arg four>` to the text-creating functions. The error interrupts processing and issues the text at the terminal. After user input, the run continues.

---

<code>\msg_warning:nnnnnn</code>	<code>\msg_warning:nnnnnn {\langle module \rangle} {\langle message \rangle} {\langle arg one \rangle} {\langle arg two \rangle} {\langle arg</code>
<code>\msg_warning:nneeee</code>	<code>three \rangle} {\langle arg four \rangle}</code>
<code>\msg_warning:nnnnn</code>	
<code>\msg_warning:(nneee nnnee)</code>	
<code>\msg_warning:nnnn</code>	
<code>\msg_warning:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_warning:nnn</code>	
<code>\msg_warning:(nnV nne)</code>	
<code>\msg_warning:nn</code>	

---

Updated: 2012-08-11

Issues  $\langle module \rangle$  warning  $\langle message \rangle$ , passing  $\langle arg one \rangle$  to  $\langle arg four \rangle$  to the text-creating functions. The warning text is added to the log file and the terminal, but the  $\text{\TeX}$  run is not interrupted.

---

<code>\msg_note:nnnnnn</code>	<code>\msg_note:nnnnnn {\langle module \rangle} {\langle message \rangle} {\langle arg one \rangle} {\langle arg two \rangle} {\langle arg</code>
<code>\msg_note:nneeee</code>	<code>three \rangle} {\langle arg four \rangle}</code>
<code>\msg_note:nnnnn</code>	<code>\msg_info:nnnnnn {\langle module \rangle} {\langle message \rangle} {\langle arg one \rangle} {\langle arg two \rangle} {\langle arg</code>
<code>\msg_note:(nneee nnnee)</code>	<code>three \rangle} {\langle arg four \rangle}</code>
<code>\msg_note:nnnn</code>	
<code>\msg_note:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_note:nnn</code>	
<code>\msg_note:(nnV nne)</code>	
<code>\msg_note:nn</code>	
<code>\msg_info:nnnnnn</code>	
<code>\msg_info:nneeee</code>	
<code>\msg_info:nnnnn</code>	
<code>\msg_info:(nneee nnnee)</code>	
<code>\msg_info:nnnn</code>	
<code>\msg_info:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_info:nnn</code>	
<code>\msg_info:(nnV nne)</code>	
<code>\msg_info:nn</code>	

---

New: 2021-05-18

Issues  $\langle module \rangle$  information  $\langle message \rangle$ , passing  $\langle arg one \rangle$  to  $\langle arg four \rangle$  to the text-creating functions. For the more common `\msg_info:nnnnnn`, the information text is added to the log file only, while `\msg_note:nnnnnn` adds the info text to both the log file and the terminal. The  $\text{\TeX}$  run is not interrupted.

---

<code>\msg_term:nnnnnn</code>	<code>\msg_term:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg</code>
<code>\msg_term:nneeee</code>	<code>three&gt;} {&lt;arg four&gt;}</code>
<code>\msg_term:nnnnn</code>	<code>\msg_log:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg</code>
<code>\msg_term:(nneee nnnee)</code>	<code>three&gt;} {&lt;arg four&gt;}</code>
<code>\msg_term:nnnn</code>	
<code>\msg_term:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_term:nnn</code>	
<code>\msg_term:(nnV nne)</code>	
<code>\msg_term:nn</code>	
<code>\msg_log:nnnnnn</code>	
<code>\msg_log:nneeee</code>	
<code>\msg_log:nnnnn</code>	
<code>\msg_log:(nneee nnnee)</code>	
<code>\msg_log:nnnn</code>	
<code>\msg_log:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_log:nnn</code>	
<code>\msg_log:(nnV nne)</code>	
<code>\msg_log:nn</code>	

---

Updated: 2012-08-11

Issues `<module>` information `<message>`, passing `<arg one>` to `<arg four>` to the text-creating functions. The output is briefer than `\msg_info:nnnnnn`, omitting for instance the module name. It is added to the log file by `\msg_log:nnnnnn` while `\msg_term:nnnnnn` also prints it on the terminal.

---

<code>\msg_none:nnnnnn</code>	<code>\msg_none:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg</code>
<code>\msg_none:nneeee</code>	<code>three&gt;} {&lt;arg four&gt;}</code>
<code>\msg_none:nnnnn</code>	
<code>\msg_none:(nneee nnnee)</code>	
<code>\msg_none:nnnn</code>	
<code>\msg_none:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_none:nnn</code>	
<code>\msg_none:(nnV nne)</code>	
<code>\msg_none:nn</code>	

---

Updated: 2012-08-11

Does nothing: used as a message class to prevent any output at all (see the discussion of message redirection).

### 11.4.1 Messages for showing material

---

<code>\msg_show:nnnnnn</code>	<code>\msg_show:nnnnnn {&lt;module&gt;} {&lt;message&gt;} {&lt;arg one&gt;} {&lt;arg two&gt;} {&lt;arg three&gt;} {&lt;arg four&gt;}</code>
<code>\msg_show:nneeee</code>	
<code>\msg_show:nnnnn</code>	
<code>\msg_show:(nneee nnnee)</code>	
<code>\msg_show:nnnn</code>	
<code>\msg_show:(nnVV nnVn nnnV nnee nnne)</code>	
<code>\msg_show:nnn</code>	
<code>\msg_show:(nnV nne)</code>	
<code>\msg_show:nn</code>	

---

New: 2017-12-04

Issues `<module>` information `<message>`, passing `<arg one>` to `<arg four>` to the text-creating functions. The information text is shown on the terminal and the T<sub>E</sub>X run is interrupted in a manner similar to `\tl_show:n`. This is used in conjunction with `\msg_show_item:n` and similar functions to print complex variable contents completely. If the formatted text does not contain `>~` at the start of a line, an additional line `>~.` will be put at the end. In addition, a final period is added if not present.

---

<code>\msg_show_item:n</code>	<code>* \seq_map_function:NN &lt;seq var&gt; \msg_show_item:n</code>
<code>\msg_show_item_unbraced:n</code>	<code>* \prop_map_function:NN &lt;property list&gt; \msg_show_item:nn</code>
<code>\msg_show_item:nn</code>	<code>*</code>
<code>\msg_show_item_unbraced:nn</code>	<code>*</code>

---

New: 2017-12-04

Used in the text of messages for `\msg_show:nnnnnn` to show or log a list of items or key-value pairs. The output of `\msg_show_item:n` produces a newline, the prefix `>`, two spaces, then the braced string representation of its argument. The two-argument versions separates the key and value using `uu=>uu`, and the `unbraced` versions don't print the surrounding braces.

These functions are suitable for usage with iterator functions like `\seq_map_function:NN`, `\prop_map_function:NN`, etc. For example, with a sequence `\l_tmpa_seq` containing `a`, `{b}` and `\c`,

```
\seq_map_function:NN \l_tmpa_seq \msg_show_item:n
```

would expand to three lines:

```
>uu{a}
>uu{{b}}
>uu{\c}
```

### 11.4.2 Expandable error messages

In very rare cases it may be necessary to produce errors in an expansion-only context. The functions in this section should only be used if there is no alternative approach using `\msg_error:nnnnnn` or other non-expandable commands from the previous section. Despite having a similar interface as non-expandable messages, expandable errors must be handled internally very differently from normal error messages, as none of the tools

to print to the terminal or the log file are expandable. As a result, short-hands such as `\{` or `\` do not work, and messages must be very short (with default settings, they are truncated after approximately 50 characters). It is advisable to ensure that the message is understandable even when truncated, by putting the most important information up front. Another particularity of expandable messages is that they cannot be redirected or turned off by the user.

---

```

\msg_expandable_error:nnnnnn * \msg_expandable_error:nnnnnn {\module} {\message} {\arg one} {\arg two}
\msg_expandable_error:nnffff * {\arg three} {\arg four}
\msg_expandable_error:nnnnn *
\msg_expandable_error:nnfff *
\msg_expandable_error:nnnn *
\msg_expandable_error:nnff *
\msg_expandable_error:nnn *
\msg_expandable_error:nnf *
\msg_expandable_error:nn *

```

---

New: 2015-08-06

Updated: 2019-02-28

---

Issues an “Undefined error” message from T<sub>E</sub>X itself using the undefined control sequence `\??? then prints “! <module>: <error message>”, which should be short. With default settings, anything beyond approximately 60 characters long (or bytes in some engines) is cropped. A leading space might be removed as well.`

## 11.5 Redirecting messages

Each message has a “name”, which can be used to alter the behaviour of the message when it is given. Thus we might have

```
\msg_new:nnnn { module } { my-message } { Some-text } { Some-more-text }
```

to define a message, with

```
\msg_error:nn { module } { my-message }
```

when it is used. With no filtering, this raises an error. However, we could alter the behaviour with

```
\msg_redirect_class:nn { error } { warning }
```

to turn all errors into warnings, or with

```
\msg_redirect_module:nnn { module } { error } { warning }
```

to alter only messages from that module, or even

```
\msg_redirect_name:nnn { module } { my-message } { warning }
```

to target just one message. Redirection applies first to individual messages, then to messages from one module and finally to messages of one class. Thus it is possible to select out an individual message for special treatment even if the entire class is already redirected.

Multiple redirections are possible. Redirections can be cancelled by providing an empty argument for the target class. Redirection to a missing class raises an error

immediately. Infinite loops are prevented by eliminating the redirection starting from the target of the redirection that caused the loop to appear. Namely, if redirections are requested as  $A \rightarrow B$ ,  $B \rightarrow C$  and  $C \rightarrow A$  in this order, then the  $A \rightarrow B$  redirection is cancelled.

<hr/>	<code>\msg_redirect_class:nn</code>	<code>\msg_redirect_class:nn {&lt;class one&gt;} {&lt;class two&gt;}</code>
<hr/>	Updated: 2012-04-27	Changes the behaviour of messages of <code>&lt;class one&gt;</code> so that they are processed using the code for those of <code>&lt;class two&gt;</code> . Each <code>&lt;class&gt;</code> can be one of <code>fatal</code> , <code>critical</code> , <code>error</code> , <code>warning</code> , <code>note</code> , <code>info</code> , <code>term</code> , <code>log</code> , <code>none</code> .
<hr/>	<code>\msg_redirect_module:nnn</code>	<code>\msg_redirect_module:nnn {&lt;module&gt;} {&lt;class one&gt;} {&lt;class two&gt;}</code>
<hr/>	Updated: 2012-04-27	Redirects message of <code>&lt;class one&gt;</code> for <code>&lt;module&gt;</code> to act as though they were from <code>&lt;class two&gt;</code> . Messages of <code>&lt;class one&gt;</code> from sources other than <code>&lt;module&gt;</code> are not affected by this redirection. This function can be used to make some messages “silent” by default. For example, all of the <code>warning</code> messages of <code>&lt;module&gt;</code> could be turned off with:
		<code>\msg_redirect_module:nnn { module } { warning } { none }</code>
<hr/>	<code>\msg_redirect_name:nnn</code>	<code>\msg_redirect_name:nnn {&lt;module&gt;} {&lt;message&gt;} {&lt;class&gt;}</code>
<hr/>	Updated: 2012-04-27	Redirects a specific <code>&lt;message&gt;</code> from a specific <code>&lt;module&gt;</code> to act as a member of <code>&lt;class&gt;</code> of messages. No further redirection is performed. This function can be used to make a selected message “silent” without changing global parameters:
		<code>\msg_redirect_name:nnn { module } { annoying-message } { none }</code>

## Chapter 12

# The l3file module

## File and I/O operations

This module provides functions for working with external files. Some of these functions apply to an entire file, and have prefix `\file_...`, while others are used to work with files on a line by line basis and have prefix `\ior_...` (reading) or `\iow_...` (writing).

It is important to remember that when reading external files  $\text{\TeX}$  attempts to locate them using both the operating system path and entries in the  $\text{\TeX}$  file database (most  $\text{\TeX}$  systems use such a database). Thus the “current path” for  $\text{\TeX}$  is somewhat broader than that for other programs.

For functions which expect a  $\langle file\ name \rangle$  argument, this argument may contain both literal items and expandable content, which should on full expansion be the desired file name. Active characters (as declared in `\l_char_active_seq`) are *not* expanded, allowing the direct use of these in file names. Quote tokens (") are not permitted in file names as they are reserved for internal use by some  $\text{\TeX}$  primitives.

Spaces are trimmed at the beginning and end of the file name: this reflects the fact that some file systems do not allow or interact unpredictably with spaces in these positions. When no extension is given, this will trim spaces from the start of the name only.

### 12.1 Input–output stream management

As  $\text{\TeX}$  engines have a limited number of input and output streams, direct use of the streams by the programmer is not supported in  $\text{\LaTeX}3$ . Instead, an internal pool of streams is maintained, and these are allocated and deallocated as needed by other modules. As a result, the programmer should close streams when they are no longer needed, to release them for other processes.

Note that I/O operations are global: streams should all be declared with global names and treated accordingly.

<hr/>	
<code>\ior_new:N</code>	<code>\ior_new:N &lt;stream&gt;</code>
<code>\ior_new:c</code>	<code>\iow_new:N &lt;stream&gt;</code>
<code>\iow_new:N</code>	Globally reserves the name of the <code>&lt;stream&gt;</code> , either for reading or for writing as appropriate. The <code>&lt;stream&gt;</code> is not opened until the appropriate <code>\..._open:Nn</code> function is used.
<code>\iow_new:c</code>	Attempting to use a <code>&lt;stream&gt;</code> which has not been opened is an error, and the <code>&lt;stream&gt;</code> will behave as the corresponding <code>\c_term_....</code>
New: 2011-09-26	
Updated: 2011-12-27	
<hr/>	
<code>\ior_open:Nn</code>	<code>\ior_open:Nn &lt;stream&gt; {&lt;file name&gt;}</code>
<code>\ior_open:cn</code>	Opens <code>&lt;file name&gt;</code> for reading using <code>&lt;stream&gt;</code> as the control sequence for file access. If the <code>&lt;stream&gt;</code> was already open it is closed before the new operation begins. The <code>&lt;stream&gt;</code> is available for access immediately and will remain allocated to <code>&lt;file name&gt;</code> until an <code>\ior_close:N</code> instruction is given or the T <sub>E</sub> X run ends. If the file is not found, an error is raised.
Updated: 2012-2010	
<hr/>	
<code>\ior_open:NnTF</code>	<code>\ior_open:NnTF &lt;stream&gt; {&lt;file name&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\ior_open:cnTF</code>	Opens <code>&lt;file name&gt;</code> for reading using <code>&lt;stream&gt;</code> as the control sequence for file access. If the <code>&lt;stream&gt;</code> was already open it is closed before the new operation begins. The <code>&lt;stream&gt;</code> is available for access immediately and will remain allocated to <code>&lt;file name&gt;</code> until a <code>\ior_close:N</code> instruction is given or the T <sub>E</sub> X run ends. The <code>&lt;true code&gt;</code> is then inserted into the input stream. If the file is not found, no error is raised and the <code>&lt;false code&gt;</code> is inserted into the input stream.
New: 2013-01-12	
<hr/>	
<code>\iow_open:Nn</code>	<code>\iow_open:Nn &lt;stream&gt; {&lt;file name&gt;}</code>
<code>\iow_open:(NV cn cV)</code>	Opens <code>&lt;file name&gt;</code> for writing using <code>&lt;stream&gt;</code> as the control sequence for file access. If the <code>&lt;stream&gt;</code> was already open it is closed before the new operation begins. The <code>&lt;stream&gt;</code> is available for access immediately and will remain allocated to <code>&lt;file name&gt;</code> until a <code>\iow_close:N</code> instruction is given or the T <sub>E</sub> X run ends. Opening a file for writing clears any existing content in the file (i.e., writing is <i>not</i> additive).
Updated: 2012-02-09	
<hr/>	
<code>\ior_shell_open:Nn</code>	<code>\ior_shell_open:Nn &lt;stream&gt; {&lt;shell command&gt;}</code>
New: 2019-05-08	
<hr/>	
	Opens the <i>pseudo</i> -file created by the output of the <code>&lt;shell command&gt;</code> for reading using <code>&lt;stream&gt;</code> as the control sequence for access. If the <code>&lt;stream&gt;</code> was already open it is closed before the new operation begins. The <code>&lt;stream&gt;</code> is available for access immediately and will remain allocated to <code>&lt;shell command&gt;</code> until a <code>\ior_close:N</code> instruction is given or the T <sub>E</sub> X run ends. If piped system calls are disabled an error is raised.
	For details of handling of the <code>&lt;shell command&gt;</code> , see <code>\sys_get_shell:nnNTF</code> .
<hr/>	
<code>\iow_shell_open:Nn</code>	<code>\iow_shell_open:Nn &lt;stream&gt; {&lt;shell command&gt;}</code>
New: 2023-05-25	
<hr/>	
	Opens the <i>pseudo</i> -file created by the output of the <code>&lt;shell command&gt;</code> for writing using <code>&lt;stream&gt;</code> as the control sequence for access. If the <code>&lt;stream&gt;</code> was already open it is closed before the new operation begins. The <code>&lt;stream&gt;</code> is available for access immediately and will remain allocated to <code>&lt;shell command&gt;</code> until an <code>\iow_close:N</code> instruction is given or the T <sub>E</sub> X run ends. If piped system calls are disabled an error is raised.
	For details of handling of the <code>&lt;shell command&gt;</code> , see <code>\sys_get_shell:nnNTF</code> .

---

<code>\ior_close:N</code>	<code>\ior_close:N</code> $\langle stream \rangle$
<code>\ior_close:c</code>	<code>\ior_close:N</code> $\langle stream \rangle$
<code>\iow_close:N</code>	Closes the $\langle stream \rangle$ . Streams should always be closed when they are finished with as this ensures that they remain available to other programmers.
<code>\iow_close:c</code>	

---

Updated: 2012-07-31

---

<code>\iow_log_list:</code>	<code>\iow_log_list:</code>

---

New: 2017-06-27	Display (to the terminal or log file) a list of the file names associated with each open (read or write) stream. This is intended for tracking down problems.
-----------------	---

---

### 12.1.1 Reading from files

Reading from files and reading from the terminal are separate processes in `expl3`. The functions `\ior_get:NN` and `\ior_str_get:NN`, and their branching equivalents, are designed to work with *files*.

---

<code>\ior_get:NN</code> <code>\ior_get:NNTF</code>	<code>\ior_get:NN &lt;stream&gt; &lt;tl var&gt;</code> <code>\ior_get:NNTF &lt;stream&gt; &lt;tl var&gt; {\true code} {\false code}</code>
--	---

---

New: 2012-06-24  
Updated: 2019-03-23

Function that reads one or more lines (until an equal number of left and right braces are found) from the file input `<stream>` and stores the result locally in the `<token list>` variable. The material read from the `<stream>` is tokenized by  $\text{\TeX}$  according to the category codes and `\endlinechar` in force when the function is used. Assuming normal settings, any lines which do not end in a comment character `%` have the line ending converted to a space, so for example input

a b c

results in a token list `a b c`. Any blank line is converted to the token `\par`. Therefore, blank lines can be skipped by using a test such as

```
\ior_get:NN \l_my_ior \l_tmpa_tl
\tl_set:Nn \l_tmpb_tl { \par }
\tl_if_eq:NMF \l_tmpa_tl \l_tmpb_tl
...
```

Also notice that if multiple lines are read to match braces then the resulting token list can contain `\par` tokens. In the non-branching version, where the `<stream>` is not open the `<tl var>` is set to `\q_no_value`.

**$\text{\TeX}$ hackers note:** This protected macro is a wrapper around the  $\text{\TeX}$  primitive `\read`. Regardless of settings,  $\text{\TeX}$  replaces trailing space and tab characters (character codes 32 and 9) in each line by an end-of-line character (character code `\endlinechar`, omitted if `\endlinechar` is negative or too large) before turning characters into tokens according to current category codes. With default settings, spaces appearing at the beginning of lines are also ignored.

---

<code>\ior_str_get:NN</code> <code>\ior_str_get:NNTF</code>	<code>\ior_str_get:NN &lt;stream&gt; &lt;tl var&gt;</code> <code>\ior_str_get:NNTF &lt;stream&gt; &lt;tl var&gt; {\true code} {\false code}</code>
--	---

---

New: 2016-12-04  
Updated: 2019-03-23

Function that reads one line from the file input `<stream>` and stores the result locally in the `<token list>` variable. The material is read from the `<stream>` as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). Multiple whitespace characters are retained by this process. It always only reads one line and any blank lines in the input result in the `<tl var>` being empty. Unlike `\ior_get:NN`, line ends do not receive any special treatment. Thus input

a b c

results in a token list `a b c` with the letters `a`, `b`, and `c` having category code 12. In the non-branching version, where the `<stream>` is not open the `<tl var>` is set to `\q_no_value`.

**$\text{\TeX}$ hackers note:** This protected macro is a wrapper around the  $\varepsilon$ - $\text{\TeX}$  primitive `\readline`. Regardless of settings,  $\text{\TeX}$  removes trailing space and tab characters (character codes 32 and 9). However, the end-line character normally added by this primitive is not included in the result of `\ior_str_get:NN`.

All mappings are done at the current group level, i.e., any local assignments made by the `<function>` or `<code>` discussed below remain in effect after the loop.

<hr/> <code>\ior_map_inline:Nn</code> <hr/>	<code>\ior_map_inline:Nn &lt;stream&gt; {&lt;inline function&gt;}</code>
<hr/> New: 2012-02-11 <hr/>	Applies the <code>&lt;inline function&gt;</code> to each set of <code>&lt;lines&gt;</code> obtained by calling <code>\ior_get:NN</code> until reaching the end of the file. T <sub>E</sub> X ignores any trailing new-line marker from the file it reads. The <code>&lt;inline function&gt;</code> should consist of code which receives the <code>&lt;line&gt;</code> as #1.
<hr/> <code>\ior_str_map_inline:Nn</code> <hr/>	<code>\ior_str_map_inline:Nn &lt;stream&gt; {&lt;inline function&gt;}</code>
<hr/> New: 2012-02-11 <hr/>	Applies the <code>&lt;inline function&gt;</code> to every <code>&lt;line&gt;</code> in the <code>&lt;stream&gt;</code> . The material is read from the <code>&lt;stream&gt;</code> as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The <code>&lt;inline function&gt;</code> should consist of code which receives the <code>&lt;line&gt;</code> as #1. Note that T <sub>E</sub> X removes trailing space and tab characters (character codes 32 and 9) from every line upon input. T <sub>E</sub> X also ignores any trailing new-line marker from the file it reads.
<hr/> <code>\ior_map_variable:NNn</code> <hr/>	<code>\ior_map_variable:NNn &lt;stream&gt; &lt;tl var&gt; {&lt;code&gt;}</code>
<hr/> New: 2019-01-13 <hr/>	For each set of <code>&lt;lines&gt;</code> obtained by calling <code>\ior_get:NN</code> until reaching the end of the file, stores the <code>&lt;lines&gt;</code> in the <code>&lt;tl var&gt;</code> then applies the <code>&lt;code&gt;</code> . The <code>&lt;code&gt;</code> will usually make use of the <code>&lt;variable&gt;</code> , but this is not enforced. The assignments to the <code>&lt;variable&gt;</code> are local. Its value after the loop is the last set of <code>&lt;lines&gt;</code> , or its original value if the <code>&lt;stream&gt;</code> is empty. T <sub>E</sub> X ignores any trailing new-line marker from the file it reads. This function is typically faster than <code>\ior_map_inline:Nn</code> .
<hr/> <code>\ior_str_map_variable:NNn</code> <hr/>	<code>\ior_str_map_variable:NNn &lt;stream&gt; &lt;variable&gt; {&lt;code&gt;}</code>
<hr/> New: 2019-01-13 <hr/>	For each <code>&lt;line&gt;</code> in the <code>&lt;stream&gt;</code> , stores the <code>&lt;line&gt;</code> in the <code>&lt;variable&gt;</code> then applies the <code>&lt;code&gt;</code> . The material is read from the <code>&lt;stream&gt;</code> as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The <code>&lt;code&gt;</code> will usually make use of the <code>&lt;variable&gt;</code> , but this is not enforced. The assignments to the <code>&lt;variable&gt;</code> are local. Its value after the loop is the last <code>&lt;line&gt;</code> , or its original value if the <code>&lt;stream&gt;</code> is empty. Note that T <sub>E</sub> X removes trailing space and tab characters (character codes 32 and 9) from every line upon input. T <sub>E</sub> X also ignores any trailing new-line marker from the file it reads. This function is typically faster than <code>\ior_str_map_inline:Nn</code> .

<hr/>	<code>\ior_map_break:</code>
<hr/>	
New: 2012-06-29	Used to terminate a <code>\ior_map...</code> function before all lines from the $\langle stream \rangle$ have been processed. This normally takes place within a conditional statement, for example

```

\ior_map_inline:Nn \l_my_ior
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \ior_map_break: }
  {
    % Do something useful
  }
}

```

Use outside of a `\ior_map...` scenario leads to low level  $\text{\TeX}$  errors.

**$\text{\TeX}$ hackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

<hr/>	<code>\ior_map_break:n</code>
<hr/>	
New: 2012-06-29	Used to terminate a <code>\ior_map...</code> function before all lines in the $\langle stream \rangle$ have been processed, inserting the $\langle code \rangle$ after the mapping has ended. This normally takes place within a conditional statement, for example

```

\ior_map_inline:Nn \l_my_ior
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \ior_map_break:n { <code> } }
  {
    % Do something useful
  }
}

```

Use outside of a `\ior_map...` scenario leads to low level  $\text{\TeX}$  errors.

**$\text{\TeX}$ hackers note:** When the mapping is broken, additional tokens may be inserted before the  $\langle code \rangle$  is inserted into the input stream. This depends on the design of the mapping function.

<hr/>	<code>\ior_if_eof_p:N</code>
<hr/>	
Updated: 2012-02-10	Tests if the end of a file $\langle stream \rangle$ has been reached during a reading operation. The test also returns a <code>true</code> value if the $\langle stream \rangle$ is not open.

## 12.1.2 Reading from the terminal

<code>\ior_get_term:nN</code>	<code>\ior_get_term:nN {&lt;prompt&gt;} &lt;tl var&gt;</code>
<code>\ior_str_get_term:nN</code>	Function that reads one or more lines (until an equal number of left and right braces are found) from the terminal and stores the result locally in the <code>&lt;token list&gt;</code> variable. Tokenization occurs as described for <code>\ior_get:NN</code> or <code>\ior_str_get:NN</code> , respectively. When the <code>&lt;prompt&gt;</code> is empty, <code>TeX</code> will wait for input without any other indication: typically the programmer will have provided a suitable text using e.g. <code>\iow_term:n</code> . Where the <code>&lt;prompt&gt;</code> is given, it will appear in the terminal followed by an <code>=</code> , e.g.
New: 2019-03-23	<code>prompt=</code>

## 12.1.3 Writing to files

<code>\iow_now:Nn</code>	<code>\iow_now:Nn &lt;stream&gt; {&lt;tokens&gt;}</code>
<code>\iow_now:(NV Ne cn cV ce)</code>	This function writes <code>&lt;tokens&gt;</code> to the specified <code>&lt;stream&gt;</code> immediately (i.e., the write operation is called on expansion of <code>\iow_now:Nn</code> ).
Updated: 2012-06-05	
<code>\iow_log:n</code>	<code>\iow_log:n {&lt;tokens&gt;}</code>
<code>\iow_log:e</code>	This function writes the given <code>&lt;tokens&gt;</code> to the log (transcript) file immediately: it is a dedicated version of <code>\iow_now:Nn</code> .
<code>\iow_show:n</code>	<code>\iow_show:n {&lt;tokens&gt;}</code>
<code>\iow_show:e</code>	This function writes the given <code>&lt;tokens&gt;</code> immediately to the same output as used by <code>\show</code> and <code>\showtokens</code> . At the start of a <code>TeX</code> run this will be the terminal, but may be redirected to a file if the primitive <code>\showstream</code> has been set.
New: 2025-05-19	
<code>\iow_term:n</code>	<code>\iow_term:n {&lt;tokens&gt;}</code>
<code>\iow_term:e</code>	This function writes the given <code>&lt;tokens&gt;</code> to the terminal file immediately: it is a dedicated version of <code>\iow_now:Nn</code> .
<code>\iow_shipout:Nn</code>	<code>\iow_shipout:Nn &lt;stream&gt; {&lt;tokens&gt;}</code>
<code>\iow_shipout:(Ne cn ce)</code>	This function writes <code>&lt;tokens&gt;</code> to the specified <code>&lt;stream&gt;</code> when the current page is finalised (i.e., at shipout). The <code>e</code> -type variants expand the <code>&lt;tokens&gt;</code> at the point where the function is used but <i>not</i> when the resulting tokens are written to the <code>&lt;stream&gt;</code> (cf. <code>\iow_shipout_e:Nn</code> ).

**TeXhackers note:** At present, there is no `expl3` interface to set `\showstream`, but use of the `\iow_show:n` function is encouraged in places where direct writing to an I/O stream is intermixed with `show` functions.

**TeXhackers note:** When using `expl3` with a format other than `LATeX`, new line characters inserted using `\iow_newline:` or using the line-wrapping code `\iow_wrap:nnnN` are not recognized in the argument of `\iow_shipout:Nn`. This may lead to the insertion of additional unwanted line-breaks.

<code>\iow_shipout_e:Nn</code>	<code>\iow_shipout_e:Nn &lt;stream&gt; {&lt;tokens&gt;}</code>
<code>\iow_shipout_e:(Ne cn ce)</code>	This function writes <code>&lt;tokens&gt;</code> to the specified <code>&lt;stream&gt;</code> when the current page is finalised (i.e., at shipout). The <code>&lt;tokens&gt;</code> are expanded at the time of writing in addition to any expansion when the function is used. This makes these functions suitable for including material finalised during the page building process (such as the page number integer).
Updated: 2023-09-17	

**T<sub>E</sub>Xhackers note:** This is a wrapper around the T<sub>E</sub>X primitive `\write`. When using `expl3` with a format other than L<sup>A</sup>T<sub>E</sub>X, new line characters inserted using `\iow_newline:` or using the line-wrapping code `\iow_wrap:nnnN` are not recognized in the argument of `\iow_shipout:Nn`. This may lead to the insertion of additional unwanted line-breaks.

<code>\iow_char:N</code> ★	<code>\iow_char:N \&lt;char&gt;</code>
	Inserts <code>&lt;char&gt;</code> into the output stream. Useful when trying to write difficult characters such as %, {, }, etc. in messages, for example:

```
\iow_now:Ne \g_my_iow { \iow_char:N \{ text \iow_char:N \} }
```

The function has no effect if writing is taking place without expansion (*e.g.* in the second argument of `\iow_now:Nn`).

<code>\iow_newline:</code> ★	<code>\iow_newline:</code>
	Function to add a new line within the <code>&lt;tokens&gt;</code> written to a file. The function has no effect if writing is taking place without expansion ( <i>e.g.</i> in the second argument of <code>\iow_now:Nn</code> ).

**T<sub>E</sub>Xhackers note:** When using `expl3` with a format other than L<sup>A</sup>T<sub>E</sub>X, the character inserted by `\iow_newline:` is not recognized by T<sub>E</sub>X, which may lead to the insertion of additional unwanted line-breaks. This issue only affects `\iow_shipout:Nn`, `\iow_shipout_e:Nn` and direct uses of primitive operations.

## 12.1.4 Wrapping lines in output

---

<code>\iow_wrap:nnnN</code> <code>\iow_wrap:nenN</code>	<code>\iow_wrap:nnnN {&lt;text&gt;} {&lt;run-on text&gt;} {&lt;set up&gt;} &lt;function&gt;</code>
--	--

---

New: 2012-06-28  
Updated: 2017-12-04

---

This function wraps the `<text>` to a fixed number of characters per line. At the start of each line which is wrapped, the `<run-on text>` is inserted. The line character count targeted is the value of `\l_iow_line_count_int` minus the number of characters in the `<run-on text>` for all lines except the first, for which the target number of characters is simply `\l_iow_line_count_int` since there is no run-on text. The `<text>` and `<run-on text>` are exhaustively expanded by the function, with the following substitutions:

- `\\` or `\iow_newline`: may be used to force a new line,
- `\_` may be used to represent a forced space (for example after a control sequence),
- `\#, \% , \{ , \} , \~` may be used to represent the corresponding character,
- `\iow_wrap_allow_break`: may be used to allow a line-break without inserting a space,
- `\iow_indent:n` may be used to indent a part of the `<text>` (not the `<run-on text>`).

Additional functions may be added to the wrapping by using the `<set up>`, which is executed before the wrapping takes place: this may include overriding the substitutions listed.

Any expandable material in the `<text>` which is not to be expanded on wrapping should be converted to a string using `\token_to_str:N`, `\tl_to_str:n`, `\tl_to_str:N`, etc.

The result of the wrapping operation is passed as a braced argument to the `<function>`, which is typically a wrapper around a write operation. The output of `\iow_wrap:nnnN` (i.e., the argument passed to the `<function>`) consists of characters of category “other” (category code 12), with the exception of spaces which have category “space” (category code 10). This means that the output does *not* expand further when written to a file.

**T<sub>E</sub>Xhackers note:** Internally, `\iow_wrap:nnnN` carries out an e-type expansion on the `<text>` to expand it. This is done in such a way that `\exp_not:N` or `\exp_not:n` could be used to prevent expansion of material. However, this is less conceptually clear than conversion to a string, which is therefore the supported method for handling expandable material in the `<text>`.

---

<code>\iow_wrap_allow_break:</code>	<code>\iow_wrap_allow_break:</code>
-------------------------------------	-------------------------------------

---

New: 2023-04-25

---

In the first argument of `\iow_wrap:nnnN` (for instance in messages), inserts a break-point that allows a line break. If no break occurs, this function adds nothing to the output.

---

<code>\iow_indent:n</code>	<code>\iow_indent:n {&lt;text&gt;}</code>
----------------------------	---

---

New: 2011-09-21

---

In the first argument of `\iow_wrap:nnnN` (for instance in messages), indents `<text>` by four spaces. This function does not cause a line break, and only affects lines which start within the scope of the `<text>`. In case the indented `<text>` should appear on separate lines from the surrounding text, use `\\` to force line breaks.

<code>\l_iow_line_count_int</code>	The maximum number of characters in a line to be written by the <code>\iow_wrap:nnnN</code> function. This value depends on the T <sub>E</sub> X system in use: the standard value is 78, which is typically correct for unmodified T <sub>E</sub> X Live and MiK <sub>T</sub> E <sub>X</sub> systems.
New: 2012-06-24	

### 12.1.5 Constant input–output streams, and variables

<code>\g_tmpa_iow</code> <code>\g_tmpb_iow</code>	Scratch input stream for global use. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
New: 2017-12-11	

<code>\c_log_iow</code> <code>\c_term_iow</code>	Constant output streams for writing to the log and to the terminal (plus the log), respectively.
---	--

<code>\g_tmpa_iow</code> <code>\g_tmpb_iow</code>	Scratch output stream for global use. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
New: 2017-12-11	

### 12.1.6 Primitive conditionals

<code>\if_eof:w</code> ★	<pre> \if_eof:w &lt;stream&gt;   &lt;true code&gt; \else:   &lt;false code&gt; \fi: </pre> <p>Tests if the <code>&lt;stream&gt;</code> returns “end of file”, which is true for non-existent files. The <code>\else:</code> branch is optional.</p>
--------------------------	---

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifeof`.

## 12.2 File operations

### 12.2.1 Basic file operations

<code>\g_file_curr_dir_str</code> <code>\g_file_curr_name_str</code> <code>\g_file_curr_ext_str</code>	Contain the directory, name and extension of the current file. The directory is empty if the file was loaded without an explicit path (i.e., if it is in the T <sub>E</sub> X search path), and does <i>not</i> end in / other than the case that it is exactly equal to the root directory. The <code>&lt;name&gt;</code> and <code>&lt;ext&gt;</code> parts together make up the file name, thus the <code>&lt;name&gt;</code> part may be thought of as the “job name” for the current file.
New: 2017-06-21	

Note that T<sub>E</sub>X does not provide information on the `<dir>` and `<ext>` part for the main (top level) file and that this file always has empty `<dir>` and `<ext>` components. Also, the `<name>` here will be equal to `\c_sys_jobname_str`, which may be different from the real file name (if set using `--jobname`, for example).

<code>\l_file_search_path_seq</code>	Each entry is the path to a directory which should be searched when seeking a file. Each path can be relative or absolute, and need not include the trailing slash. Spaces need not be quoted.
New: 2017-06-18	
Updated: 2023-06-15	

**TeXhackers note:** When working as a package in L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, `expl3` will automatically append the current `\input@path` to the set of values from `\l_file_search_path_seq`.

<code>\file_if_exist_p:n</code> ☆	<code>\file_if_exist_p:n {&lt;file name&gt;}</code>
<code>\file_if_exist_p:V</code> ☆	<code>\file_if_exist:nTF {&lt;file name&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\file_if_exist:nTF</code> ☆	Expands the argument of the <code>&lt;file name&gt;</code> to give a string, then searches for this string using the current TeX search path and the additional paths controlled by <code>\l_file_search_path_seq</code> .
<code>\file_if_exist:VTF</code> ☆	
Updated: 2023-09-18	

Since TeX cannot remove files, only write to them, once a file has been found during a TeX run, it will exist until the end of the run unless a non-TeX process intervenes. Since file operations are relatively slow, `expl3` therefore internally tracks when a file is seen, and uses this information to avoid multiple filesystem checks. See `\file_forget:n` for how to indicate to `expl3` that a file may have been deleted *during* a TeX run, so that its presence in the filesystem can be reasserted with `\file_if_exist:nTF` and similar commands.

<code>\file_forget:n</code>	<code>\file_forget:n {&lt;file name&gt;}</code>
New: 2024-12-09	Resets the internal tracker for files such that a subsequent use of <code>\file_if_exist:nTF</code> , <code>\file_size:n</code> , etc., for the <code>&lt;file name&gt;</code> will re-query the filesystem rather than use any cached information. This can be used whether or not the file has previously been seen. This function is intended to be used where non-TeX processes may result in file deletion, for example if LuaTeX is in use, <code>os.remove()</code> may be used to delete a file part-way through a run.

## 12.2.2 Information about files and file contents

Functions in this section return information about files as `expl3 str` data, *except* that the non-expandable functions set their return *token list* to `\q_no_value` if the file requested is not found. As such, comparison of file names, hashes, sizes, etc., should use `\str_if_eq:nnTF` rather than `\tl_if_eq:nnTF` and so on.

<code>\file_hex_dump:n</code> ☆	<code>\file_hex_dump:n {&lt;file name&gt;}</code>
<code>\file_hex_dump:V</code> ☆	<code>\file_hex_dump:nnn {&lt;file name&gt;} {&lt;start index&gt;} {&lt;end index&gt;}</code>
<code>\file_hex_dump:nnn</code> ☆	Searches for <code>&lt;file name&gt;</code> using the current TeX search path and the additional paths controlled by <code>\l_file_search_path_seq</code> . It then expands to leave the hexadecimal dump of the file content in the input stream. The file is read as bytes, which means that in contrast to most TeX behaviour there will be a difference in result depending on the line endings used in text files. The same file will produce the same result between different engines: the algorithm used is the same in all cases. When the file is not found, the result of expansion is empty. The <code>{&lt;start index&gt;}</code> and <code>{&lt;end index&gt;}</code> values work as described for <code>\str_range:nnn</code> .
<code>\file_hex_dump:Vnn</code> ☆	
New: 2019-11-19	

---

<code>\file_get_hex_dump:nN</code>	<code>\file_get_hex_dump:nN {&lt;file name&gt;} &lt;t1 var&gt;</code>
<code>\file_get_hex_dump:VN</code>	<code>\file_get_hex_dump:nnnN {&lt;file name&gt;} {&lt;start index&gt;} {&lt;end index&gt;} &lt;t1 var&gt;</code>
<code>\file_get_hex_dump:nNTF</code>	Sets the <code>&lt;t1 var&gt;</code> to the result of applying <code>\file_hex_dump:n/\file_hex_dump:nnn</code> to the <code>&lt;file&gt;</code> . If the file is not found, the <code>&lt;t1 var&gt;</code> will be set to <code>\q_no_value</code> .
<code>\file_get_hex_dump:VNTF</code>	
<code>\file_get_hex_dump:nnnN</code>

<code>\file_md5five_hash:n</code> ☆	<code>\file_md5five_hash:n {&lt;file name&gt;}</code>
<code>\file_md5five_hash:V</code> ☆	Searches for <code>&lt;file name&gt;</code> using the current TeX search path and the additional paths controlled by <code>\l_file_search_path_seq</code> . It then expands to leave the MD5 sum generated from the contents of the file in the input stream. The file is read as bytes, which means that in contrast to most TeX behaviour there will be a difference in result depending on the line endings used in text files. The same file will produce the same result between different engines: the algorithm used is the same in all cases. When the file is not found, the result of expansion is empty.

Updated: 2019-09-20

---

Compares the file stamps on the two `<files>` as indicated by the `<relation>`, and inserts either the `<true code>` or `<false case>` as required. A file which is not found is treated as older than any file which is found. This allows for example the construct

```
\file_compare_timestamp:nNnT { source-file } > { derived-file }
{
  % Code to regenerate derived file
}
```

to work when the derived file is entirely absent. The timestamp of two absent files is regarded as different.

<hr/>	
<code>\file_parse_full_name:nNNN</code>	<code>\file_parse_full_name:nNNN {&lt;full name&gt;} &lt;dir&gt; &lt;name&gt; &lt;ext&gt;</code>
<code>\file_parse_full_name:VNNN</code>	Parses the <code>&lt;full name&gt;</code> and splits it into three parts, each of which is returned by setting the appropriate local string variable:
New: 2017-06-23	
Updated: 2020-06-24	
<hr/>	
	<ul style="list-style-type: none"> <li>• The <code>&lt;dir&gt;</code>: everything up to the last / (path separator) in the <code>&lt;file path&gt;</code>. As with system PATH variables and related functions, the <code>&lt;dir&gt;</code> does <i>not</i> include the trailing / unless it points to the root directory. If there is no path (only a file name), <code>&lt;dir&gt;</code> is empty.</li> <li>• The <code>&lt;name&gt;</code>: everything after the last / up to the last ., where both of those characters are optional. The <code>&lt;name&gt;</code> may contain multiple . characters. It is empty if <code>&lt;full name&gt;</code> consists only of a directory name.</li> <li>• The <code>&lt;ext&gt;</code>: everything after the last . (including the dot). The <code>&lt;ext&gt;</code> is empty if there is no . after the last /.</li> </ul>
	Before parsing, the <code>&lt;full name&gt;</code> is expanded until only non-expandable tokens remain, except that active characters are also not expanded. Quotes (") are invalid in file names and are discarded from the input.

<hr/>	
<code>\file_parse_full_name:n *</code>	<code>\file_parse_full_name:n {&lt;full name&gt;}</code>
<code>\file_parse_full_name:V *</code>	Parses the <code>&lt;full name&gt;</code> as described for <code>\file_parse_full_name:nNNN</code> , and leaves <code>&lt;dir&gt;</code> , <code>&lt;name&gt;</code> , and <code>&lt;ext&gt;</code> in the input stream, each inside a pair of braces.
New: 2020-06-24	
<hr/>	

<hr/>	
<code>\file_parse_full_name_apply:nN *</code>	<code>\file_parse_full_name_apply:nN {&lt;full name&gt;} &lt;function&gt;</code>
<code>\file_parse_full_name_apply:VN *</code>	
New: 2020-06-24	
<hr/>	
	Parses the <code>&lt;full name&gt;</code> as described for <code>\file_parse_full_name:nNNN</code> , and passes <code>&lt;dir&gt;</code> , <code>&lt;name&gt;</code> , and <code>&lt;ext&gt;</code> as arguments to <code>&lt;function&gt;</code> , as an n-type argument each, in this order.

### 12.2.3 Accessing file contents

<hr/>	
<code>\file_get:nnN</code>	<code>\file_get:nnN {&lt;file name&gt;} {&lt;setup&gt;} &lt;tl var&gt;</code>
<code>\file_get:VnN</code>	<code>\file_get:nnNTF {&lt;file name&gt;} {&lt;setup&gt;} &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\file_get:nnNTF</code>	Defines <code>&lt;tl var&gt;</code> to the contents of <code>&lt;file name&gt;</code> . Category codes may need to be set appropriately via the <code>&lt;setup&gt;</code> argument. The non-branching version sets the <code>&lt;tl var&gt;</code> to <code>\q_no_value</code> if the file is not found. The branching version runs the <code>&lt;true code&gt;</code> after the assignment to <code>&lt;tl var&gt;</code> if the file is found, and <code>&lt;false code&gt;</code> otherwise. The file content will be tokenized using the current category code régime,
<code>\file_get:VnNTF</code>

Updated: 2019-02-16	
<hr/>	
<code>\file_input:n</code>	<code>\file_input:n {&lt;file name&gt;}</code>
<code>\file_input:V</code>	Searches for <code>&lt;file name&gt;</code> in the path as detailed for <code>\file_if_exist:nTF</code> , and if found reads in the file as additional L <sup>A</sup> T <sub>E</sub> X source. All files read are recorded for information and the file name stack is updated by this function. An error is raised if the file is not found.
Updated: 2017-06-26	
<hr/>	

<hr/>	
<code>\file_input_raw:n</code> *	<code>\file_input_raw:n {&lt;file name&gt;}</code>
<code>\file_input_raw:V</code> *	Searches for <code>&lt;file name&gt;</code> in the path as detailed for <code>\file_if_exist:nTF</code> , and if found reads in the file as additional T <sub>E</sub> X source. No data concerning the file is tracked. If the file is not found, no action is taken.
<hr/>	
New: 2023-05-18	

**T<sub>E</sub>Xhackers note:** This function is intended only for contexts where files must be read purely by expansion, for example at the start of a table cell in an `\halign`.

<hr/>	
<code>\file_if_exist_input:n</code>	<code>\file_if_exist_input:n {&lt;file name&gt;}</code>
<code>\file_if_exist_input:V</code>	<code>\file_if_exist_input:nF {&lt;file name&gt;} {&lt;false code&gt;}</code>
<code>\file_if_exist_input:nF</code>	Searches for <code>&lt;file name&gt;</code> using the current T <sub>E</sub> X search path and the additional paths included in <code>\l_file_search_path_seq</code> . If found then reads in the file as additional L <sup>A</sup> T <sub>E</sub> X source as described for <code>\file_input:n</code> , otherwise inserts the <code>&lt;false code&gt;</code> . Note that these functions do not raise an error if the file is not found, in contrast to <code>\file_input:n</code> .
<code>\file_if_exist_input:VF</code>	
<hr/>	
New: 2014-07-02	

<hr/>	
<code>\file_input_stop:</code>	<code>\file_input_stop:</code>
<hr/>	
New: 2017-07-07	Ends the reading of a file started by <code>\file_input:n</code> or similar before the end of the file is reached. Where the file reading is being terminated due to an error, <code>\msg_critical:nn(nn)</code> should be preferred.

**T<sub>E</sub>Xhackers note:** This function must be used on a line on its own: T<sub>E</sub>X reads files line-by-line and so any additional tokens in the “current” line will still be read.

This is also true if the function is hidden inside another function (which will be the normal case), i.e., all tokens on the same line in the source file are still processed. Putting it on a line by itself in the definition doesn’t help as it is the line where it is used that counts!

<hr/>	
<code>\file_show_list:</code>	<code>\file_show_list:</code>
<code>\file_log_list:</code>	<code>\file_log_list:</code>
<hr/>	
	These functions list all files loaded by L <sup>A</sup> T <sub>E</sub> X 2 <sub>ε</sub> commands that populate <code>\@filelist</code> or by <code>\file_input:n</code> . While <code>\file_show_list:</code> displays the list in the terminal, <code>\file_log_list:</code> outputs it to the log file only.

## Chapter 13

# The `l3luatex` module LuaTeX-specific functions

The LuaTeX engine provides access to the Lua programming language, and with it access to the “internals” of TeX. In order to use this within the framework provided here, a family of functions is available. When used with pdfTeX, pTeX, upTeX or XeTeX these raise an error: use `\sys_if_engine luatex:T` to avoid this. Details on using Lua with the LuaTeX engine are given in the LuaTeX manual.

### 13.1 Breaking out to Lua

---

<code>\lua_now:n</code>	★	<code>\lua_now:n {⟨token list⟩}</code>
-------------------------	---	--

<code>\lua_now:e</code>	★
-------------------------	---

---

New: 2018-06-18
-----------------

The `⟨token list⟩` is first tokenized by TeX, which includes converting line ends to spaces in the usual TeX manner and which respects currently-applicable TeX category codes. The resulting `⟨Lua input⟩` is passed to the Lua interpreter for processing. Each `\lua_now:n` block is treated by Lua as a separate chunk. The Lua interpreter executes the `⟨Lua input⟩` immediately, and in an expandable manner.

**TeXhackers note:** `\lua_now:e` is a macro wrapper around `\directlua`: when LuaTeX is in use two expansions are required to yield the result of the Lua code.

---

<code>\lua_shipout_e:n</code>	<code>\lua_shipout:n {⟨token list⟩}</code>
-------------------------------	--

<code>\lua_shipout:n</code>
-----------------------------

---

New: 2018-06-18
-----------------

The `⟨token list⟩` is first tokenized by TeX, which includes converting line ends to spaces in the usual TeX manner and which respects currently-applicable TeX category codes. The resulting `⟨Lua input⟩` is passed to the Lua interpreter when the current page is finalised (i.e., at shipout). Each `\lua_shipout:n` block is treated by Lua as a separate chunk. The Lua interpreter will execute the `⟨Lua input⟩` during the page-building routine: no TeX expansion of the `⟨Lua input⟩` will occur at this stage.

In the case of the `\lua_shipout_e:n` version the input is fully expanded by TeX in an e-type manner during the shipout operation.

**TeXhackers note:** At a TeX level, the `⟨Lua input⟩` is stored as a “whatsit”.

---

`\lua_escape:n` ★ `\lua_escape:n {⟨token list⟩}`

`\lua_escape:e` ★

---

New: 2015-06-29

Converts the `⟨token list⟩` such that it can safely be passed to Lua: embedded backslashes, double and single quotes, and newlines and carriage returns are escaped. This is done by prepending an extra token consisting of a backslash with category code 12, and for the line endings, converting them to `\n` and `\r`, respectively.

**TeXhackers note:** `\lua_escape:e` is a macro wrapper around `\luaescapestring:` when LuaTeX is in use two expansions are required to yield the result of the Lua code.

---

`\lua_load_module:n` `\lua_load_module:n {⟨Lua module name⟩}`

---

New: 2022-05-14

Loads a Lua module into the Lua interpreter.

`\lua_now:n` passes its `{⟨token list⟩}` argument to the Lua interpreter as a single line, with characters interpreted under the current catcode régime. These two facts mean that `\lua_now:n` rarely behaves as expected for larger pieces of code. Therefore, package authors should **not** write significant amounts of Lua code in the arguments to `\lua_now:n`. Instead, it is strongly recommended that they write the majority of their Lua code in a separate file, and then load it using `\lua_load_module:n`.

**TeXhackers note:** This is a wrapper around the Lua call `require '⟨module⟩'`.

## 13.2 Lua interfaces

As well as interfaces for TeX, there are a small number of Lua functions provided here.

---

`ltx.utils`

Most public interfaces provided by the module are stored within the `ltx.utils` table.

---

`ltx.utils.filedump` `⟨dump⟩ = ltx.utils.filedump(⟨file⟩,⟨offset⟩,⟨length⟩)`

Returns the uppercase hexadecimal representation of the content of the `⟨file⟩` read as bytes. If the `⟨length⟩` is given, only this part of the file is returned; similarly, one may specify the `⟨offset⟩` from the start of the file. If the `⟨length⟩` is not given, the entire file is read starting at the `⟨offset⟩`.

---

`ltx.utils.filemd5sum` `⟨hash⟩ = ltx.utils.filemd5sum(⟨file⟩)`

Returns the MD5 sum of the file contents read as bytes; note that the result will depend on the nature of the line endings used in the file, in contrast to normal TeX behaviour. If the `⟨file⟩` is not found, nothing is returned with *no error raised*.

---

`ltx.utils.filemoddate` `⟨date⟩ = ltx.utils.filemoddate(⟨file⟩)`

Returns the date/time of last modification of the `⟨file⟩` in the format

`D:⟨year⟩⟨month⟩⟨day⟩⟨hour⟩⟨minute⟩⟨second⟩⟨offset⟩`

where the latter may be Z (UTC) or `⟨plus-minus⟩⟨hours⟩'⟨minutes⟩'`. If the `⟨file⟩` is not found, nothing is returned with *no error raised*.

---

`ltx.utils.filesize` `size = ltx.utils.filesize(<file>)`

---

Returns the size of the *<file>* in bytes. If the *<file>* is not found, nothing is returned with *no error raised*.

## Chapter 14

# The l3legacy module

## Interfaces to legacy concepts

There are a small number of T<sub>E</sub>X or L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> concepts which are not used in expl3 code but which need to be manipulated when working as a L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> package. To allow these to be integrated cleanly into expl3 code, a set of legacy interfaces are provided here.

---

<code>\legacy_if_p:n</code>	★	<code>\legacy_if_p:n {&lt;name&gt;}</code>
<code>\legacy_if:nTF</code>	★	<code>\legacy_if:nTF {&lt;name&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

Tests if the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>/plain T<sub>E</sub>X conditional (generated by `\newif`) is `true` or `false` and branches accordingly. The `<name>` of the conditional should *omit* the leading `if`.

---

<code>\legacy_if_set_true:n</code>	<code>\legacy_if_set_true:n {&lt;name&gt;}</code>
<code>\legacy_if_set_false:n</code>	<code>\legacy_if_set_false:n {&lt;name&gt;}</code>
<code>\legacy_if_gset_true:n</code>	Sets the L <sup>A</sup> T <sub>E</sub> X 2 <sub>ε</sub> /plain T <sub>E</sub> X conditional <code>\if&lt;name&gt;</code> (generated by <code>\newif</code> ) to be <code>true</code> or <code>false</code> .
<code>\legacy_if_gset_false:n</code>	

---

New: 2021-05-10

---

<code>\legacy_if_set:nn</code>	<code>\legacy_if_set:nn {&lt;name&gt;} {&lt;boolexpr&gt;}</code>
<code>\legacy_if_gset:nn</code>	Sets the L <sup>A</sup> T <sub>E</sub> X 2 <sub>ε</sub> /plain T <sub>E</sub> X conditional <code>\if&lt;name&gt;</code> (generated by <code>\newif</code> ) to the result of evaluating the <code>&lt;boolean expression&gt;</code> .

---

New: 2021-05-10

Part IV

## Data types

## Chapter 15

# The `l3tl` module

## Token lists

$\text{\TeX}$  works with tokens, and  $\text{\LaTeX3}$  therefore provides a number of functions to deal with lists of tokens. Token lists may be present directly in the argument to a function:

```
\foo:n { a collection of \tokens }
```

or may be stored in a so-called “tl var” (`\tl var`), which have the suffix `tl`: a token list variable can also be used as the argument to a function, for example

```
\foo:N \l_some_tl
```

In both cases, functions are available to test and manipulate the lists of tokens, and these have the module prefix `tl`. In many cases, functions which can be applied to token list variables are paired with similar functions for application to explicit lists of tokens: the two “views” of a token list are therefore collected together here.

A token list (explicit, or stored in a variable) can be seen either as a list of “items”, or a list of “tokens”. An item is whatever `\use:n` would grab as its argument: a single non-space token or a brace group, with optional leading explicit space characters (each item is thus itself a token list). A token is either a normal `N` argument, or `\`, `{`, or `}` (assuming normal  $\text{\TeX}$  category codes). Thus for example

```
{ Hello } ~ world
```

contains six items (`Hello`, `w`, `o`, `r`, `l` and `d`), but thirteen tokens (`{`, `H`, `e`, `l`, `l`, `o`, `}`, `\`, `w`, `o`, `r`, `l` and `d`). Functions which act on items are often faster than their analogue acting directly on tokens.

### 15.1 Creating and initialising token list variables

---

```
\tl_new:N \tl_new:N <tl var>
```

---

```
\tl_new:c
```

Creates a new `<tl var>` or raises an error if the name is already taken. The declaration is global. The `<tl var>` is initially empty.

<hr/>	
<code>\tl_const:Nn</code>	<code>\tl_const:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<code>\tl_const:(NV Ne cn cV ce)</code>	Creates a new constant <code>&lt;tl var&gt;</code> or raises an error if the name is already taken. The value of the <code>&lt;tl var&gt;</code> is set globally to the <code>&lt;tokens&gt;</code> .
<hr/>	
<code>\tl_clear:N</code>	<code>\tl_clear:N &lt;tl var&gt;</code>
<code>\tl_clear:c</code>	Clears all entries from the <code>&lt;tl var&gt;</code> .
<code>\tl_gclear:N</code>	
<code>\tl_gclear:c</code>	
<hr/>	
<code>\tl_clear_new:N</code>	<code>\tl_clear_new:N &lt;tl var&gt;</code>
<code>\tl_clear_new:c</code>	Ensures that the <code>&lt;tl var&gt;</code> exists globally by applying <code>\tl_new:N</code> if necessary, then applies <code>\tl_(g)clear:N</code> to leave the <code>&lt;tl var&gt;</code> empty.
<code>\tl_gclear_new:N</code>	
<code>\tl_gclear_new:c</code>	
<hr/>	
<code>\tl_set_eq:NN</code>	<code>\tl_set_eq:NN &lt;tl var<sub>1</sub>&gt; &lt;tl var<sub>2</sub>&gt;</code>
<code>\tl_set_eq:(cN Nc cc)</code>	Sets the content of <code>&lt;tl var<sub>1</sub>&gt;</code> equal to that of <code>&lt;tl var<sub>2</sub>&gt;</code> .
<code>\tl_gset_eq:NN</code>	
<code>\tl_gset_eq:(cN Nc cc)</code>	
<hr/>	
<code>\tl_concat:NNN</code>	<code>\tl_concat:NNN &lt;tl var<sub>1</sub>&gt; &lt;tl var<sub>2</sub>&gt; &lt;tl var<sub>3</sub>&gt;</code>
<code>\tl_concat:ccc</code>	Concatenates the content of <code>&lt;tl var<sub>2</sub>&gt;</code> and <code>&lt;tl var<sub>3</sub>&gt;</code> together and saves the result in <code>&lt;tl var<sub>1</sub>&gt;</code> . The <code>&lt;tl var<sub>2</sub>&gt;</code> is placed at the left side of the new token list.
<code>\tl_gconcat:NNN</code>	
<code>\tl_gconcat:ccc</code>	
<hr/>	
New: 2012-05-18	
<hr/>	
<code>\tl_if_exist_p:N *</code>	<code>\tl_if_exist_p:N &lt;tl var&gt;</code>
<code>\tl_if_exist_p:c *</code>	<code>\tl_if_exist:NTF &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_exist:NTF *</code>	Tests whether the <code>&lt;tl var&gt;</code> is currently defined. This does not check that the <code>&lt;tl var&gt;</code> really is a token list variable.
<code>\tl_if_exist:cTF *</code>	
<hr/>	
New: 2012-03-03	

## 15.2 Adding data to token list variables

<hr/>	
<code>\tl_set:Nn</code>	<code>\tl_set:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<code>\tl_set:(NV Nv No Ne Nf cn cV cv co ce cf)</code>	
<code>\tl_gset:Nn</code>	
<code>\tl_gset:(NV Nv No Ne Nf cn cV cv co ce cf)</code>	
<hr/>	
Sets <code>&lt;tl var&gt;</code> to contain <code>&lt;tokens&gt;</code> , removing any previous content from the variable.	
<hr/>	
<code>\tl_put_left:Nn</code>	<code>\tl_put_left:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<code>\tl_put_left:(NV Nv Ne No cn cV cv ce co)</code>	
<code>\tl_gput_left:Nn</code>	
<code>\tl_gput_left:(NV Nv Ne No cn cV cv ce co)</code>	
<hr/>	
Appends <code>&lt;tokens&gt;</code> to the left side of the current content of <code>&lt;tl var&gt;</code> .	

---

<code>\tl_put_right:Nn</code>	<code>\tl_put_right:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<code>\tl_put_right:(NV Nv Ne No cn cV cv ce co)</code>	
<code>\tl_gput_right:Nn</code>	
<code>\tl_gput_right:(NV Nv Ne No cn cV cv ce co)</code>	

---

Appends `<tokens>` to the right side of the current content of `<tl var>`.

## 15.3 Token list conditionals

---

<code>\tl_if_blank_p:n</code>	<code>\tl_if_blank_p:n {&lt;token list&gt;}</code>
<code>\tl_if_blank_p:(e V o)</code>	<code>\tl_if_blank:nTF {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_blank:nTF</code>	<code>\tl_if_blank:nTF</code>
<code>\tl_if_blank:(e V o)TF</code>	<code>\tl_if_blank:(e V o)TF</code>

---

Updated: 2019-09-04

Tests if the `<token list>` consists only of blank spaces (i.e., contains no item). The test is `true` if `<token list>` is zero or more explicit space characters (explicit tokens with character code 32 and category code 10), and is `false` otherwise.

---

<code>\tl_if_empty_p:N</code>	<code>\tl_if_empty_p:N &lt;tl var&gt;</code>
<code>\tl_if_empty_p:c</code>	<code>\tl_if_empty:nTF &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_empty:nTF</code>	<code>\tl_if_empty:nTF</code>
<code>\tl_if_empty:cTF</code>	<code>\tl_if_empty:cTF</code>

---

Tests if the `<tl var>` is entirely empty (i.e., contains no tokens at all).

---

<code>\tl_if_empty_p:n</code>	<code>\tl_if_empty_p:n {&lt;token list&gt;}</code>
<code>\tl_if_empty_p:(V o e)</code>	<code>\tl_if_empty:nTF {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_empty:nTF</code>	<code>\tl_if_empty:nTF</code>
<code>\tl_if_empty:(V o e)TF</code>	<code>\tl_if_empty:(V o e)TF</code>

---

New: 2012-05-24  
Updated: 2012-06-05

Tests if the `<token list>` is entirely empty (i.e., contains no tokens at all).

---

<code>\tl_if_eq_p:NN</code>	<code>\tl_if_eq_p:NN &lt;tl var<sub>12</sub></code>
<code>\tl_if_eq_p:(Nc cN cc)</code>	<code>\tl_if_eq:NNTF &lt;tl var<sub>12</sub></code>
<code>\tl_if_eq:NNTF</code>	<code>\tl_if_eq:NNTF</code>
<code>\tl_if_eq:(Nc cN cc)TF</code>	<code>\tl_if_eq:(Nc cN cc)TF</code>

---

Compares the content of `<tl var1 and <tl var2 and is logically true if the two contain the same list of tokens (i.e., identical in both the list of characters they contain and the category codes of those characters). Thus for example`

```
\tl_set:Nn \l_tmpa_tl { abc }
\tl_set:Ne \l_tmpb_tl { \tl_to_str:n { abc } }
\tl_if_eq:NNTF \l_tmpa_tl \l_tmpb_tl { true } { false }
```

yields `false`. See also `\str_if_eq:nnTF` for a comparison that ignores category codes.

---

<code>\tl_if_eq:NnTF</code>	<code>\tl_if_eq:NnTF &lt;tl var<sub>12</sub></code>
<code>\tl_if_eq:cnTF</code>	<code>\tl_if_eq:cnTF</code>

---

New: 2020-07-14

Tests if the `<tl var1 and the <token list2 contain the same list of tokens, both in respect of character codes and category codes. This conditional is not expandable: see \tl_if_eq:NNTF for an expandable version when both token lists are stored in variables, or \str_if_eq:nnTF if category codes are not important.`

<u>\tl_if_eq:nnTF</u> <u>\tl_if_eq:(nV ne Vn en ee)TF</u>	<u>\tl_if_eq:nnTF</u> {<token list <sub>1</sub> >} {<token list <sub>2</sub> >} {<true code>} {<false code>}
	Tests if <token list <sub>1</sub> > and <token list <sub>2</sub> > contain the same list of tokens, both in respect of character codes and category codes. This conditional is not expandable: see \tl_if_eq:nnTF for an expandable version when token lists are stored in variables, or \str_if_eq:nnTF if category codes are not important.
<u>\tl_if_in:NnTF</u> <u>\tl_if_in:(NV No cn cV co)TF</u>	<u>\tl_if_in:NnTF</u> <tl var> {<token list>} {<true code>} {<false code>}
	Tests if the <token list> is found in the content of the <tl var>. The <token list> cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).
<u>\tl_if_in:nnTF</u> <u>\tl_if_in:(Vn VV on oo nV no)TF</u>	<u>\tl_if_in:nnTF</u> {<token list <sub>1</sub> >} {<token list <sub>2</sub> >} {<true code>} {<false code>}
	Tests if <token list <sub>2</sub> > is found inside <token list <sub>1</sub> >. The <token list <sub>2</sub> > cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). The search does <i>not</i> enter brace (category code 1/2) groups.
<u>\tl_if_novalue_p:n</u> ★ <u>\tl_if_novalue:nTF</u> ★	<u>\tl_if_novalue_p:n</u> {<token list>} <u>\tl_if_novalue:nTF</u> {<token list>} {<true code>} {<false code>}
New: 2017-11-14	Tests if the <token list> and the special \c_novalue_tl marker contain the same list of tokens, both in respect of character codes and category codes. This means that \exp_args:No \tl_if_novalue:nTF { \c_novalue_tl } is logically true but \tl_if_novalue:nTF { \c_novalue_tl } is logically false. This function is intended to allow construction of flexible document interface structures in which missing optional arguments are detected.
<u>\tl_if_single_p:N</u> ★ <u>\tl_if_single_p:c</u> ★ <u>\tl_if_single:NnTF</u> ★ <u>\tl_if_single:cTF</u> ★	<u>\tl_if_single_p:N</u> <tl var> <u>\tl_if_single_p:c</u> <tl var> {<true code>} {<false code>} Tests if the content of the <tl var> consists of a single <item>, i.e., is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to \tl_count:N.
Updated: 2011-08-13	
<u>\tl_if_single_p:n</u> ★ <u>\tl_if_single:nTF</u> ★	<u>\tl_if_single_p:n</u> {<token list>} <u>\tl_if_single:nTF</u> {<token list>} {<true code>} {<false code>}
Updated: 2011-08-13	Tests if the <token list> has exactly one <item>, i.e., is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to \tl_count:n.
<u>\tl_if_single_token_p:n</u> ★ <u>\tl_if_single_token:nTF</u> ★	<u>\tl_if_single_token_p:n</u> {<token list>} <u>\tl_if_single_token:nTF</u> {<token list>} {<true code>} {<false code>}
	Tests if the token list consists of exactly one token, i.e., is either a single space character or a single normal token. Token groups ({...}) are not single tokens.

---

<code>\tl_if_regex_match:nnTF</code>	<code>\tl_if_regex_match:nnTF {&lt;token list&gt;} {&lt;regex&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_regex_match:VnTF</code>	<code>\tl_if_regex_match:nNTF {&lt;token list&gt;} &lt;regex var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_regex_match:nNTF</code>	Tests whether the <i>&lt;regular expression&gt;</i> matches any part of the <i>&lt;token list&gt;</i> . For instance,
<code>\tl_if_regex_match:VNTF</code>	

---

New: 2024-12-08

```

\tl_if_regex_match:nnTF { abecdcx } { b [cde]* } { TRUE } { FALSE }
\tl_if_regex_match:nnTF { example } { [b-dq-w] } { TRUE } { FALSE }

```

leaves TRUE then FALSE in the input stream. Theses are alternative names for `\regex_if_match:nnTF` and friends, with arguments re-ordered for *<token list>* testing; see `l3regex` chapter for more details of the *<regex>* format.

### 15.3.1 Testing the first token

---

<code>\tl_if_head_eq_catcode_p:nN</code>	<code>* \tl_if_head_eq_catcode_p:nN {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_catcode_p:(VN eN oN)</code>	<code>* \tl_if_head_eq_catcode:nNTF {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_catcode:nNTF</code>	<code>* {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_head_eq_catcode:(VN eN oN)TF</code>	<code>* </code>

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same category code as the *<test token>*. In the case where the *<token list>* is empty, the test is always **false**.

---

<code>\tl_if_head_eq_charcode_p:nN</code>	<code>* \tl_if_head_eq_charcode_p:nN {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_charcode_p:(VN eN fN)</code>	<code>* \tl_if_head_eq_charcode:nNTF {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_charcode:nNTF</code>	<code>* {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_head_eq_charcode:(VN eN fN)TF</code>	<code>* </code>

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same character code as the *<test token>*. In the case where the *<token list>* is empty, the test is always **false**.

---

<code>\tl_if_head_eq_meaning_p:nN</code>	<code>* \tl_if_head_eq_meaning_p:nN {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_meaning_p:(VN eN)</code>	<code>* \tl_if_head_eq_meaning:nNTF {&lt;token list&gt;} &lt;test token&gt;</code>
<code>\tl_if_head_eq_meaning:nNTF</code>	<code>* {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\tl_if_head_eq_meaning:(VN eN)TF</code>	<code>* </code>

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same meaning as the *<test token>*. In the case where *<token list>* is empty, the test is always **false**.

---

<code>\tl_if_head_is_group_p:n</code>	<code>* \tl_if_head_is_group_p:n {&lt;token list&gt;}</code>
<code>\tl_if_head_is_group:nTF</code>	<code>* \tl_if_head_is_group:nTF {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2012-07-08

Tests if the first *<token>* in the *<token list>* is an explicit begin-group character (with category code 1 and any character code), in other words, if the *<token list>* starts with a brace group. In particular, the test is **false** if the *<token list>* starts with an implicit token such as `\c_group_begin_token`, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

---

```

\tl_if_head_is_N_type_p:n * \tl_if_head_is_N_type_p:n {\token list}
\tl_if_head_is_N_type:nTF * \tl_if_head_is_N_type:nTF {\token list} {\true code} {\false code}

```

---

New: 2012-07-08

---

Tests if the first  $\langle token \rangle$  in the  $\langle token list \rangle$  is a normal N-type argument. In other words, it is neither an explicit space character (explicit token with character code 32 and category code 10) nor an explicit begin-group character (with category code 1 and any character code). An empty argument yields **false**, as it does not have a normal first token. This function is useful to implement actions on token lists on a token by token basis.

---

```

\tl_if_head_is_space_p:n * \tl_if_head_is_space_p:n {\token list}
\tl_if_head_is_space:nTF * \tl_if_head_is_space:nTF {\token list} {\true code} {\false code}

```

---

Updated: 2012-07-08

---

Tests if the first  $\langle token \rangle$  in the  $\langle token list \rangle$  is an explicit space character (explicit token with character code 32 and category code 10). In particular, the test is **false** if the  $\langle token list \rangle$  starts with an implicit token such as `\c_space_token`, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

## 15.4 Working with token lists as a whole

### 15.4.1 Using token lists

---

```

\tl_to_str:n * \tl_to_str:n {\token list}
\tl_to_str:(o|V|v|e) *

```

---

Converts the  $\langle token list \rangle$  to a  $\langle string \rangle$ , leaving the resulting character tokens in the input stream. A  $\langle string \rangle$  is a series of tokens with category code 12 (other) with the exception of spaces, which retain category code 10 (space). The base function requires only a single expansion. Its argument *must* be braced.

**T<sub>E</sub>Xhackers note:** This is the  $\varepsilon$ -T<sub>E</sub>X primitive `\detokenize`. Converting a  $\langle token list \rangle$  to a  $\langle string \rangle$  yields a concatenation of the string representations of every token in the  $\langle token list \rangle$ . The string representation of a control sequence is

- an escape character, whose character code is given by the internal parameter `\escapechar`, absent if the `\escapechar` is negative or greater than the largest character code;
- the control sequence name, as defined by `\cs_to_str:N`;
- a space, unless the control sequence name is a single character whose category at the time of expansion of `\tl_to_str:n` is not “letter”.

The string representation of an explicit character token is that character, doubled in the case of (explicit) macro parameter characters (normally `#`). In particular, the string representation of a token list may depend on the category codes in effect when it is evaluated, and the value of the `\escapechar`: for instance `\tl_to_str:n {\a}` normally produces the three character “backslash”, “lower-case a”, “space”, but it may also produce a single “lower-case a” if the escape character is negative and `a` is currently not a letter.

---

<code>\tl_to_str:N</code>	★	<code>\tl_to_str:N &lt;tl var&gt;</code>
<code>\tl_to_str:c</code>	★	Converts the content of the <code>&lt;tl var&gt;</code> into a series of characters with category code 12 (other) with the exception of spaces, which retain category code 10 (space). This <code>&lt;string&gt;</code> is then left in the input stream. For low-level details, see the notes given for <code>\tl_to_str:n</code> .

---

---

<code>\tl_use:N</code>	★	<code>\tl_use:N &lt;tl var&gt;</code>
<code>\tl_use:c</code>	★	Recovers the content of a <code>&lt;tl var&gt;</code> and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a <code>&lt;tl var&gt;</code> directly without an accessor function.

---

## 15.4.2 Counting and reversing token lists

---

<code>\tl_count:n</code>	★	<code>\tl_count:n {(token list)}</code>
<code>\tl_count:(V v e o)</code>	★	Counts the number of <code>&lt;items&gt;</code> in the <code>&lt;token list&gt;</code> and leaves this information in the input stream. Unbraced tokens count as one element as do each token group <code>{...}</code> . This process ignores any unprotected spaces within the <code>&lt;token list&gt;</code> . See also <code>\tl_count:N</code> . This function requires three expansions, giving an <code>&lt;integer denotation&gt;</code> .

---

New: 2012-05-13

---

<code>\tl_count:N</code>	★	<code>\tl_count:N &lt;tl var&gt;</code>
<code>\tl_count:c</code>	★	Counts the number of <code>&lt;items&gt;</code> in the <code>&lt;tl var&gt;</code> and leaves this information in the input stream. Unbraced tokens count as one element as do each token group <code>{...}</code> . This process ignores any unprotected spaces within the <code>&lt;tl var&gt;</code> . See also <code>\tl_count:n</code> . This function requires three expansions, giving an <code>&lt;integer denotation&gt;</code> .

---

New: 2012-05-13

---

<code>\tl_count_tokens:n</code>	★	<code>\tl_count_tokens:n {(token list)}</code>
		Counts the number of $\mathrm{T\!E\!X}$ tokens in the <code>&lt;token list&gt;</code> and leaves this information in the input stream. Every token, including spaces and braces, contributes one to the total; thus for instance, the token count of <code>a~{bc}</code> is 6.

---

New: 2019-02-25

---

<code>\tl_reverse:n</code>	★	<code>\tl_reverse:n {(token list)}</code>
<code>\tl_reverse:(V o f e)</code>	★	Reverses the order of the <code>&lt;items&gt;</code> in the <code>&lt;token list&gt;</code> , so that <code>&lt;item<sub>1</sub>&gt;&lt;item<sub>2</sub>&gt;&lt;item<sub>3</sub>&gt;...&lt;item<sub>n</sub>&gt;</code> becomes <code>&lt;item<sub>n</sub>&gt;...&lt;item<sub>3</sub>&gt;&lt;item<sub>2</sub>&gt;&lt;item<sub>1</sub>&gt;</code> . This process preserves unprotected space within the <code>&lt;token list&gt;</code> . Tokens are not reversed within braced token groups, which keep their outer set of braces. In situations where performance is important, consider <code>\tl_reverse_items:n</code> . See also <code>\tl_reverse:N</code> .

---

Updated: 2012-01-08

**$\mathrm{T\!E\!X}$ hackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

<code>\tl_reverse:N</code>	<code>\tl_reverse:N &lt;tl var&gt;</code>
<code>\tl_reverse:c</code>	Sets the <code>&lt;tl var&gt;</code> to contain the result of reversing the order of its <code>&lt;items&gt;</code> , so that <code>&lt;item<sub>1</sub>&gt;&lt;item<sub>2</sub>&gt;&lt;item<sub>3</sub>&gt;...&lt;item<sub>n</sub>&gt;</code> becomes <code>&lt;item<sub>n</sub>&gt;...&lt;item<sub>3</sub>&gt;&lt;item<sub>2</sub>&gt;&lt;item<sub>1</sub>&gt;</code> . This process preserves unprotected spaces within the <code>&lt;tl var&gt;</code> . Braced token groups are copied without reversing the order of tokens, but keep the outer set of braces. This is equivalent to a combination of an assignment and <code>\tl_reverse:V</code> . See also <code>\tl_reverse_items:n</code> for improved performance.
<code>\tl_greverse:N</code>	
<code>\tl_greverse:c</code>	

---

Updated: 2012-01-08

---

---

<code>\tl_reverse_items:n</code> *	<code>\tl_reverse_items:n {(token list)}</code>
------------------------------------	---

---

New: 2012-01-08

---

Reverses the order of the `<items>` in the `<token list>`, so that `<item1><item2><item3>...<itemn>` becomes `{<itemn>} ... {<item3>}{<item2>}{<item1>}`. This process removes any unprotected space within the `<token list>`. Braced token groups are copied without reversing the order of tokens, and keep the outer set of braces. Items which are initially not braced are copied with braces in the result. In cases where preserving spaces is important, consider the slower function `\tl_reverse:n`.

**TeXhackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

<code>\tl_trim_spaces:n</code>	* <code>\tl_trim_spaces:n {(token list)}</code>
<code>\tl_trim_spaces:(V v e o)</code> *	Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the <code>&lt;token list&gt;</code> and leaves the result in the input stream.

---

New: 2011-07-09

---

Updated: 2012-06-25

---

**TeXhackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

<code>\tl_trim_left_spaces:n</code>	* <code>\tl_trim_left_spaces:n {(token list)}</code>
<code>\tl_trim_left_spaces:(V v e o)</code> *	Analogue of <code>\tl_trim_spaces:n</code> which removes any leading <i>or</i> trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the <code>&lt;token list&gt;</code> and leaves the result in the input stream.
<code>\tl_trim_right_spaces:n</code>	
<code>\tl_trim_right_spaces:(V v e o)</code> *	

---

New: 2025-02-02

---

Analogue of `\tl_trim_spaces:n` which removes any leading *or* trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the `<token list>` and leaves the result in the input stream.

**TeXhackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

<code>\tl_trim_spaces_apply:nN</code> *	<code>\tl_trim_spaces_apply:nN {(token list)} &lt;function&gt;</code>
<code>\tl_trim_spaces_apply:oN</code> *	Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the <code>&lt;token list&gt;</code> and passes the result to the <code>&lt;function&gt;</code> as an <b>n</b> -type argument.

---

New: 2018-04-12

---

---

<code>\tl_trim_left_spaces_apply:nN</code>	<code>*</code>	<code>\tl_trim_left_spaces_apply:nN {&lt;token list&gt;} &lt;function&gt;</code>
<code>\tl_trim_left_spaces_apply:oN</code>	<code>*</code>	
<code>\tl_trim_right_spaces_apply:nN</code>	<code>*</code>	
<code>\tl_trim_right_spaces_apply:oN</code>	<code>*</code>	

---

New: 2025-02-02

Analogue of `\tl_trim_spaces_apply:nN` which removes any leading *or* trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the `<token list>` and passes the result to the `<function>` as an `n`-type argument.

---

<code>\tl_trim_spaces:N</code>	<code>\tl_trim_spaces:N &lt;tl var&gt;</code>
<code>\tl_trim_spaces:c</code>	
<code>\tl_gtrim_spaces:N</code>	Sets the <code>&lt;tl var&gt;</code> to contain the result of removing any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from its contents.
<code>\tl_gtrim_spaces:c</code>	

---

New: 2011-07-09

---

<code>\tl_trim_left_spaces:N</code>	<code>\tl_trim_left_spaces:N &lt;tl var&gt;</code>
<code>\tl_trim_left_spaces:c</code>	
<code>\tl_trim_right_spaces:N</code>	Analogue of <code>\tl_trim_spaces:N</code> which sets the <code>&lt;tl var&gt;</code> to contain the result of removing any leading <i>or</i> trailing explicit space characters (explicit tokens with character code 32 and category code 10) from its contents.
<code>\tl_trim_right_spaces:c</code>	
<code>\tl_gtrim_left_spaces:N</code>	
<code>\tl_gtrim_left_spaces:c</code>	
<code>\tl_gtrim_right_spaces:N</code>	
<code>\tl_gtrim_right_spaces:c</code>

---

<code>\tl_map_inline:nn</code>	<code>\tl_map_inline:nn {⟨token list⟩} {⟨inline function⟩}</code>
Updated: 2012-06-29	Applies the <code>⟨inline function⟩</code> to every <code>⟨item⟩</code> stored within the <code>⟨token list⟩</code> . The <code>⟨inline function⟩</code> should consist of code which receives the <code>⟨item⟩</code> as #1. See also <code>\tl_map_function:nN</code> .

---

---

<code>\tl_map_tokens:Nn</code> ☆	<code>\tl_map_tokens:Nn ⟨tl var⟩ {⟨code⟩}</code>
<code>\tl_map_tokens:cn</code> ☆	<code>\tl_map_tokens:nn {⟨token list⟩} {⟨code⟩}</code>
<code>\tl_map_tokens:nn</code> ☆	Analogue of <code>\tl_map_function:NN</code> which maps several tokens instead of a single function. The <code>⟨code⟩</code> receives each <code>⟨item⟩</code> in the <code>⟨tl var⟩</code> or in the <code>⟨token list⟩</code> as a trailing brace group. For instance,
New: 2019-09-02	

---

`\tl_map_tokens:Nn \l_my_tl { \prg_replicate:nn { 2 } }`

expands to twice each `⟨item⟩` in the `⟨tl var⟩`: for each `⟨item⟩` in `\l_my_tl` the function `\prg_replicate:nn` receives 2 and `⟨item⟩` as its two arguments. The function `\tl_map_inline:Nn` is typically faster but is not expandable.

<code>\tl_map_variable:Nn</code>	<code>\tl_map_variable:Nn &lt;tl var&gt; &lt;variable&gt; {&lt;code&gt;}</code>
<code>\tl_map_variable:cNn</code>	Stores each <i>&lt;item&gt;</i> of the <i>&lt;tl var&gt;</i> in turn in the (token list) <i>&lt;variable&gt;</i> and applies the <i>&lt;code&gt;</i> . The <i>&lt;code&gt;</i> will usually make use of the <i>&lt;variable&gt;</i> , but this is not enforced. The assignments to the <i>&lt;variable&gt;</i> are local. Its value after the loop is the last <i>&lt;item&gt;</i> in the <i>&lt;tl var&gt;</i> , or its original value if the <i>&lt;tl var&gt;</i> is blank. See also <code>\tl_map_inline:Nn</code> .
Updated: 2012-06-29	

<code>\tl_map_variable:nNn</code>	<code>\tl_map_variable:nNn {&lt;token list&gt;} &lt;variable&gt; {&lt;code&gt;}</code>
Updated: 2012-06-29	Stores each <i>&lt;item&gt;</i> of the <i>&lt;token list&gt;</i> in turn in the (token list) <i>&lt;variable&gt;</i> and applies the <i>&lt;code&gt;</i> . The <i>&lt;code&gt;</i> will usually make use of the <i>&lt;variable&gt;</i> , but this is not enforced. The assignments to the <i>&lt;variable&gt;</i> are local. Its value after the loop is the last <i>&lt;item&gt;</i> in the <i>&lt;tl var&gt;</i> , or its original value if the <i>&lt;tl var&gt;</i> is blank. See also <code>\tl_map_inline:nn</code> .

<code>\tl_map_break: ☆</code>	<code>\tl_map_break:</code>
Updated: 2012-06-29	Used to terminate a <code>\tl_map...</code> function before all entries in the <i>&lt;token list&gt;</i> have been processed. This normally takes place within a conditional statement, for example

```

\tl_map_inline:Nn \l_my_tl
{
  \str_if_eq:nnT { #1 } { bingo } { \tl_map_break: }
  % Do something useful
}

```

See also `\tl_map_break:n`. Use outside of a `\tl_map...` scenario leads to low level  $\TeX$  errors.

**$\TeX$ hackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

<code>\tl_map_break:n ☆</code>	<code>\tl_map_break:n {&lt;code&gt;}</code>
Updated: 2012-06-29	Used to terminate a <code>\tl_map...</code> function before all entries in the <i>&lt;token list&gt;</i> have been processed, inserting the <i>&lt;code&gt;</i> after the mapping has ended. This normally takes place within a conditional statement, for example

```

\tl_map_inline:Nn \l_my_tl
{
  \str_if_eq:nnT { #1 } { bingo }
  { \tl_map_break:n { <code> } }
  % Do something useful
}

```

Use outside of a `\tl_map...` scenario leads to low level  $\TeX$  errors.

**$\TeX$ hackers note:** When the mapping is broken, additional tokens may be inserted before the *<code>* is inserted into the input stream. This depends on the design of the mapping function.

## 15.5.2 Head and tail of token lists

Functions which deal with either only the very first item (balanced text or single normal token) in a token list, or the remaining tokens.

<hr/>	
<code>\tl_head:N</code>	★ <code>\tl_head:n {⟨token list⟩}</code>
<code>\tl_head:n</code>	★
<code>\tl_head:(V v f e)</code>	★
<hr/>	
Updated: 2012-09-09	Leaves in the input stream the first <i>⟨item⟩</i> in the <i>⟨token list⟩</i> , discarding the rest of the <i>⟨token list⟩</i> . All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded; for example

`\tl_head:n { abc }`

and

`\tl_head:n { ~ abc }`

both leave `a` in the input stream. If the “head” is a brace group, rather than a single token, the braces are removed, and so

`\tl_head:n { ~ { ~ ab } c }`

yields `␣ab`. A blank *⟨token list⟩* (see `\tl_if_blank:nTF`) results in `\tl_head:n` leaving nothing in the input stream.

**TeXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an *e*-type or *x*-type argument expansion.

---

<code>\tl_head:w</code>	★	<code>\tl_head:w ⟨token list⟩ { } \q_stop</code>
-------------------------	---	--

---

Leaves in the input stream the first *⟨item⟩* in the *⟨token list⟩*, discarding the rest of the *⟨token list⟩*. All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded. A blank *⟨token list⟩* (which consists only of space characters) results in a low-level TeX error, which may be avoided by the inclusion of an empty group in the input (as shown), without the need for an explicit test. Alternatively, `\tl_if_blank:nF` may be used to avoid using the function with a “blank” argument. This function requires only a single expansion, and thus is suitable for use within an *o*-type expansion. In general, `\tl_head:n` should be preferred if the number of expansions is not critical.

---

<code>\tl_tail:N</code>	★	<code>\tl_tail:n {⟨token list⟩}</code>
<code>\tl_tail:n</code>	★	
<code>\tl_tail:(V v f e)</code>	★	Discards all leading explicit space characters (explicit tokens with character code 32 and category code 10) and the first <i>⟨item⟩</i> in the <i>⟨token list⟩</i> , and leaves the remaining tokens in the input stream. Thus for example

---

Updated: 2012-09-01

---

```
\tl_tail:n { a ~ {bc} d }
```

and

```
\tl_tail:n { ~ a ~ {bc} d }
```

both leave `␣{bc}d` in the input stream. A blank *⟨token list⟩* (see `\tl_if_blank:nTF`) results in `\tl_tail:n` leaving nothing in the input stream.

**TeXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an *e*-type or *x*-type argument expansion.

If you wish to handle token lists where the first token may be a space, and this needs to be treated as the head/tail, this can be accomplished using `\tl_if_head_is_space:nTF`, for example

```
\exp_last_unbraced:NNo
\cs_new:Npn \__mypkg_gobble_space:w \c_space_tl { }
\cs_new:Npn \mypkg_tl_head_keep_space:n #1
{
  \tl_if_head_is_space:nTF {#1}
  { ~ }
  { \tl_head:n {#1} }
}
\cs_new:Npn \mypkg_tl_tail_keep_space:n #1
{
  \tl_if_head_is_space:nTF {#1}
  { \exp_not:o { \__mypkg_gobble_space:w #1 } }
  { \tl_tail:n {#1} }
}
```

### 15.5.3 Items and ranges in token lists

---

<code>\tl_item:nn</code>	★	<code>\tl_item:nn {⟨token list⟩} {⟨integer expression⟩}</code>
<code>\tl_item:Nn</code>	★	
<code>\tl_item:cn</code>	★	Indexing items in the <i>⟨token list⟩</i> from 1 on the left, this function evaluates the <i>⟨integer expression⟩</i> and leaves the appropriate item from the <i>⟨token list⟩</i> in the input stream. If the <i>⟨integer expression⟩</i> is negative, indexing occurs from the right of the token list, starting at <code>-1</code> for the right-most item. If the index is out of bounds, then the function expands to nothing.

---

New: 2014-07-17

---

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *⟨item⟩* does not expand further when appearing in an *e*-type or *x*-type argument expansion.

---

<code>\tl_rand_item:N</code>	<code>*</code>	<code>\tl_rand_item:N</code>	<code>&lt;tl var&gt;</code>
<code>\tl_rand_item:c</code>	<code>*</code>	<code>\tl_rand_item:n</code>	<code>{&lt;token list&gt;}</code>
<code>\tl_rand_item:n</code>	<code>*</code>	Selects a pseudo-random item of the <code>&lt;token list&gt;</code> . If the <code>&lt;token list&gt;</code> is blank, the	
<small>New: 2016-12-06</small>		result is empty.	

---

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<item>` does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

```

\tl_range:Nnn * \tl_range:Nnn <tl var> {\<start index>} {\<end index>}
\tl_range:nnn * \tl_range:nnn {\<token list>} {\<start index>} {\<end index>}

```

---

**New:** 2017-02-17 Leaves in the input stream the items from the  $\langle \textit{start index} \rangle$  to the  $\langle \textit{end index} \rangle$  inclusive. Spaces and braces are preserved between the items returned (but never at either end of the list). Here  $\langle \textit{start index} \rangle$  and  $\langle \textit{end index} \rangle$  should be  $\langle \textit{integer expressions} \rangle$ . For describing in detail the functions' behavior, let  $m$  and  $n$  be the start and end index respectively. If either is 0, the result is empty. A positive index means 'start counting from the left end', and a negative index means 'from the right end'. Let  $l$  be the count of the token list.

**Updated:** 2017-07-15

The *actual start point* is determined as  $M = m$  if  $m > 0$  and as  $M = l + m + 1$  if  $m < 0$ . Similarly the *actual end point* is  $N = n$  if  $n > 0$  and  $N = l + n + 1$  if  $n < 0$ . If  $M > N$ , the result is empty. Otherwise it consists of all items from position  $M$  to position  $N$  inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions  $s$  for  $s \leq 0$  or  $s > l$ .

Spaces in between items in the actual range are preserved. Spaces at either end of the token list will be removed anyway (think to the token list being passed to `\tl_trim_spaces:n` to begin with).

Thus, with  $l = 7$  as in the examples below, all of the following are equivalent and result in the whole token list

```

\tl_range:nnn { abcd~{e{}}fg } { 1 } { 7 }
\tl_range:nnn { abcd~{e{}}fg } { 1 } { 12 }
\tl_range:nnn { abcd~{e{}}fg } { -7 } { 7 }
\tl_range:nnn { abcd~{e{}}fg } { -12 } { 7 }

```

Here are some more interesting examples. The calls

```

\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { -3 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { -3 } }

```

are all equivalent and will print `bcd{e{}}` on the terminal; similarly

```

\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { -3 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { -3 } }

```

are all equivalent and will print `bcd {e{}}` on the terminal (note the space in the middle). To the contrary,

```

\tl_range:nnn { abcd~{e{}}f } { 2 } { 4 }

```

will discard the space after 'd'.

If we want to get the items from, say, the third to the last in a token list  $\langle \textit{tl} \rangle$ , the call is `\tl_range:nnn { <tl> } { 3 } { -1 }`. Similarly, for discarding the last item, we can do `\tl_range:nnn { <tl> } { 1 } { -2 }`.

**T<sub>E</sub>Xhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the  $\langle \textit{item} \rangle$  does not expand further when appearing in an *e*-type or *x*-type argument expansion.

## 15.5.4 Sorting token lists

<hr/>	
<code>\tl_sort:Nn</code>	<code>\tl_sort:Nn &lt;tl var&gt; {&lt;comparison code&gt;}</code>
<code>\tl_sort:cn</code>	
<code>\tl_gsort:Nn</code>	Sorts the items in the <code>&lt;tl var&gt;</code> according to the <code>&lt;comparison code&gt;</code> , and assigns the
<code>\tl_gsort:cn</code>	result to <code>&lt;tl var&gt;</code> . The details of sorting comparison are described in Section 6.1.
<hr/>	
New: 2017-02-06	
<hr/>	
<code>\tl_sort:nN</code>	<code>\tl_sort:nN {&lt;token list&gt;} &lt;conditional&gt;</code>
<hr/>	
New: 2017-02-06	Sorts the items in the <code>&lt;token list&gt;</code> , using the <code>&lt;conditional&gt;</code> to compare items, and leaves the result in the input stream. The <code>&lt;conditional&gt;</code> should have signature <code>:nnTF</code> , and return <code>true</code> if the two items being compared should be left in the same order, and <code>false</code> if the items should be swapped. The details of sorting comparison are described in Section 6.1.

**TeXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an `e`-type or `x`-type argument expansion.

## 15.6 Manipulating tokens in token lists

### 15.6.1 Replacing tokens

Within token lists, replacement takes place at the top level: there is no recursion into brace groups (more precisely, within a group defined by a category code 1/2 pair).

<hr/>	
<code>\tl_replace_once:Nnn</code>	<code>\tl_replace_once:Nnn &lt;tl var&gt; {&lt;old tokens&gt;} {&lt;new tokens&gt;}</code>
<code>\tl_replace_once:(NVn NnV Nen Nne Nee cnn cVn cnV cen cne cee)</code>	
<code>\tl_greplace_once:Nnn</code>	
<code>\tl_greplace_once:(NVn NnV Nen Nne Nee cnn cVn cnV cen cne cee)</code>	
<hr/>	

Updated: 2011-08-11

Replaces the first (leftmost) occurrence of `<old tokens>` in the `<tl var>` with `<new tokens>`. `<Old tokens>` cannot contain `{`, `}` or `#` (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

<code>\tl_replace_all:Nnn</code>	<code>\tl_replace_all:Nnn &lt;tl var&gt; {&lt;old tokens&gt;} {&lt;new tokens&gt;}</code>
<code>\tl_replace_all:(NVn NnV Nen Nne Nee cnn cVn cnV cen cne cee)</code>	
<code>\tl_greplace_all:Nnn</code>	
<code>\tl_greplace_all:(NVn NnV Nen Nne Nee cnn cVn cnV cen cne cee)</code>	

Updated: 2011-08-11

Replaces all occurrences of `<old tokens>` in the `<tl var>` with `<new tokens>`. `<Old tokens>` cannot contain `{`, `}` or `#` (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern `<old tokens>` may remain after the replacement (see `\tl_remove_all:Nn` for an example).

<code>\tl_regex_replace_once:Nnn</code>	<code>\tl_regex_replace_once:Nnn &lt;tl var&gt; {&lt;regex&gt;} {&lt;replacement&gt;}</code>
<code>\tl_regex_replace_once:cnn</code>	<code>\tl_regex_replace_once:NNn &lt;tl var&gt; &lt;regex var&gt; {&lt;replacement&gt;}</code>
<code>\tl_regex_replace_once:NNn</code>	
<code>\tl_regex_replace_once:cNn</code>	
<code>\tl_regex_greplace_once:Nnn</code>	
<code>\tl_regex_greplace_once:cnn</code>	
<code>\tl_regex_greplace_once:NNn</code>	
<code>\tl_regex_greplace_once:cNn</code>	

New: 2024-12-08

Searches for the `<regular expression>` in the contents of the `<tl var>` and replaces the first match with the `<replacement>`. In the `<replacement>`, `\0` represents the full match, `\1` represents the contents of the first capturing group, `\2` of the second, etc. Theses are alternative names for `\regex_replace_once:nnN` and friends, with arguments re-ordered for `<tl var>` setting; See `l3regex` chapter for more details of the `<regex>` format.

<code>\tl_regex_replace_all:Nnn</code>	<code>\tl_regex_replace_all:Nnn &lt;tl var&gt; {&lt;regex&gt;} {&lt;replacement&gt;}</code>
<code>\tl_regex_replace_all:cnn</code>	<code>\tl_regex_replace_all:NNn &lt;tl var&gt; &lt;regex var&gt; {&lt;replacement&gt;}</code>
<code>\tl_regex_replace_all:NNn</code>	
<code>\tl_regex_replace_all:cNn</code>	
<code>\tl_regex_greplace_all:Nnn</code>	
<code>\tl_regex_greplace_all:cnn</code>	
<code>\tl_regex_greplace_all:NNn</code>	
<code>\tl_regex_greplace_all:cNn</code>	

New: 2024-12-08

Replaces all occurrences of the `<regular expression>` in the contents of the `<tl var>` by the `<replacement>`, where `\0` represents the full match, `\1` represent the contents of the first capturing group, `\2` of the second, etc. Every match is treated independently, and matches cannot overlap. Theses are alternative names for `\regex_replace_all:nnN` and friends, with arguments re-ordered for `<tl var>` setting; see `l3regex` chapter for more details of the `<regex>` format.

<code>\tl_remove_once:Nn</code>	<code>\tl_remove_once:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<code>\tl_remove_once:(NV Ne cn cV ce)</code>	
<code>\tl_gremove_once:Nn</code>	
<code>\tl_gremove_once:(NV Ne cn cV ce)</code>	

Updated: 2011-08-11

Removes the first (leftmost) occurrence of `<tokens>` from the `<tl var>`. The `<tokens>` cannot contain `{`, `}` or `#` (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

---

```

\tl_remove_all:Nn      \tl_remove_all:Nn <tl var> {<tokens>}
\tl_remove_all:(NV|Ne|cn|cV|ce)
\tl_gremove_all:Nn
\tl_gremove_all:(NV|Ne|cn|cV|ce)

```

---

Updated: 2011-08-11

---

Removes all occurrences of `<tokens>` from the `<tl var>`. The `<tokens>` cannot contain `{`, `}` or `#` (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern `<tokens>` may remain after the removal, for instance,

```
\tl_set:Nn \l_tmpa_tl {abbccd} \tl_remove_all:Nn \l_tmpa_tl {bc}
```

results in `\l_tmpa_tl` containing `abcd`.

## 15.6.2 Reassigning category codes

These functions allow the rescanning of tokens: re-apply TeX's tokenization process to apply category codes different from those in force when the tokens were absorbed. Whilst this functionality is supported, it is often preferable to find alternative approaches to achieving outcomes rather than rescanning tokens (for example construction of token lists token-by-token with intervening category code changes or using `\char_generate:nn`).

---

```

\tl_set_rescan:Nnn      \tl_set_rescan:Nnn <tl var> {<setup>} {<tokens>}
\tl_set_rescan:(NnV|Nne|Nno|cnn|cnV|cne|cno)
\tl_gset_rescan:Nnn
\tl_gset_rescan:(NnV|Nne|Nno|cnn|cnV|cne|cno)

```

---

Updated: 2015-08-11

---

Sets `<tl var>` to contain `<tokens>`, applying the category code régime specified in the `<setup>` before carrying out the assignment. (Category codes applied to tokens not explicitly covered by the `<setup>` are those in force at the point of use of `\tl_set_rescan:Nnn`.) This allows the `<tl var>` to contain material with category codes other than those that apply when `<tokens>` are absorbed. The `<setup>` is run within a group and may contain any valid input, although only changes in category codes, such as uses of `\cctab_select:N`, are relevant. See also `\tl_rescan:nn`.

**TeXhackers note:** The `<tokens>` are first turned into a string (using `\tl_to_str:n`). If the string contains one or more characters with character code `\newlinechar` (set equal to `\endlinechar` unless that is equal to 32, before the user `<setup>`), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.

<hr/> <code>\tl_rescan:nn</code>	<code>\tl_rescan:nn {\langle setup \rangle} {\langle tokens \rangle}</code>
<code>\tl_rescan:nV</code>	Rescans $\langle tokens \rangle$ applying the category code régime specified in the $\langle setup \rangle$ , and leaves the resulting tokens in the input stream. (Category codes applied to tokens not explicitly covered by the $\langle setup \rangle$ are those in force at the point of use of <code>\tl_rescan:nn</code> .) The $\langle setup \rangle$ is run within a group and may contain any valid input, although only changes in category codes, such as uses of <code>\cctab_select:N</code> , are relevant. See also <code>\tl_set_rescan:Nnn</code> , which is more robust than using <code>\tl_set:Nn</code> in the $\langle tokens \rangle$ argument of <code>\tl_rescan:nn</code> .
<hr/> Updated: 2015-08-11 <hr/>	

**TeXhackers note:** The  $\langle tokens \rangle$  are first turned into a string (using `\tl_to_str:n`). If the string contains one or more characters with character code `\newlinechar` (set equal to `\endlinechar` unless that is equal to 32, before the user  $\langle setup \rangle$ ), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.

Contrarily to the `\scantokens`  $\varepsilon$ -TeX primitive, `\tl_rescan:nn` tokenizes the whole string in the same category code régime rather than one token at a time, so that directives such as `\verb` that rely on changing category codes will not function properly.

## 15.7 Constant token lists

<hr/> <code>\c_empty_tl</code>	Constant that is always empty.
<hr/> <code>\c_novalue_tl</code>	A marker for the absence of an argument. This constant <code>tl</code> can safely be typeset ( <i>cf.</i> <code>\q_nil</code> ), with the result being <code>-NoValue-</code> . It is important to note that <code>\c_novalue_tl</code> is constructed such that it will <i>not</i> match the simple text input <code>-NoValue-</code> , i.e. that
<hr/> New: 2017-11-14 <hr/>	

`\tl_if_eq:NnTF \c_novalue_tl { -NoValue- }`

is logically **false**. The `\c_novalue_tl` marker is intended for use in creating document-level interfaces, where it serves as an indicator that an (optional) argument was omitted. In particular, it is distinct from a simple empty `tl`.

<hr/> <code>\c_space_tl</code>	An explicit space character contained in a token list (compare this with <code>\c_space_token</code> ). For use where an explicit space is required.
--------------------------------	--

## 15.8 Scratch token lists

<hr/> <code>\l_tmpa_tl</code>	Scratch token lists for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_tl</code>	

---

<code>\g_tmpa_tl</code>	Scratch token lists for global assignment. These are never used by the kernel code, and so are safe for use with any $\text{\LaTeX}$ 3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_tl</code>	

---

## Chapter 16

# The l3tl-build module

## Piecewise tl constructions

### 16.1 Constructing $\langle tl\ var \rangle$ by accumulation

When creating a  $\langle tl\ var \rangle$  by accumulation of many tokens, the performance available using a combination of `\tl_set:Nn` and `\tl_put_right:Nn` or similar begins to become an issue. To address this, a set of functions are available to “build” a  $\langle tl\ var \rangle$ . The performance of this approach is much more efficient than the standard `\tl_put_right:Nn`, but the constructed token list cannot be accessed during construction other than by methods provided in this section.

Whilst the exact performance difference is dependent on the size of each added block of tokens and the total number of blocks, in general, the `\tl_build_(g)put...` functions will out-perform the basic `\tl_(g)put...` equivalent if more than 100 non-empty addition operations occur. See <https://github.com/latex3/latex3/issues/1393#issuecomment-1880164756> for a more detailed analysis.

---

<code>\tl_build_begin:N</code>	<code>\tl_build_begin:N <math>\langle tl\ var \rangle</math></code>
--------------------------------	---

<code>\tl_build_gbegin:N</code>
---------------------------------

---

New: 2018-04-01
-----------------

Clears the  $\langle tl\ var \rangle$  and sets it up to support other `\tl_build_...` functions. Until `\tl_build_end:N  $\langle tl\ var \rangle$`  or `\tl_build_gend:N  $\langle tl\ var \rangle$`  is called, applying any function from l3tl other than `\tl_build_...` will lead to incorrect results. The `begin` and `gbegin` functions must be used for local and global  $\langle tl\ var \rangle$  respectively.

---

<code>\tl_build_put_left:Nn</code>	<code>\tl_build_put_left:Nn <math>\langle tl\ var \rangle</math> <math>\{\langle tokens \rangle\}</math></code>
<code>\tl_build_put_left:Ne</code>	<code>\tl_build_put_right:Nn <math>\langle tl\ var \rangle</math> <math>\{\langle tokens \rangle\}</math></code>

<code>\tl_build_gput_left:Nn</code>	Adds $\langle tokens \rangle$ to the left or right side of the current contents of $\langle tl\ var \rangle$ . The $\langle tl\ var \rangle$ must have been set up with <code>\tl_build_begin:N</code> or <code>\tl_build_gbegin:N</code> . The <code>put</code> and <code>gput</code> functions must be used for local and global $\langle tl\ var \rangle$ respectively. The <code>right</code> functions are about twice faster than the <code>left</code> functions.
<code>\tl_build_gput_left:Ne</code>	
<code>\tl_build_put_right:Nn</code>	
<code>\tl_build_put_right:Ne</code>	
<code>\tl_build_gput_right:Nn</code>	

<code>\tl_build_gput_right:Ne</code>
--------------------------------------

---

New: 2018-04-01
-----------------

<hr/>	<code>\tl_build_end:N</code>	<code>\tl_build_end:N</code> $\langle tl\ var \rangle$
<hr/>	<code>\tl_build_gend:N</code>	Gets the contents of $\langle tl\ var \rangle$ and stores that into the $\langle tl\ var \rangle$ using <code>\tl_set:Nn</code> or <code>\tl_gset:Nn</code> . The $\langle tl\ var \rangle$ must have been set up with <code>\tl_build_begin:N</code> or <code>\tl_build_gbegin:N</code> . The <code>end</code> and <code>gend</code> functions must be used for local and global $\langle tl\ var \rangle$ respectively. These functions completely remove the setup code that enabled $\langle tl\ var \rangle$ to be used for other <code>\tl_build_...</code> functions. After the action of <code>end/gend</code> , the $\langle tl\ var \rangle$ may be manipulated using standard <code>tl</code> functions.
<hr/>	New: 2018-04-01	

<hr/>	<code>\tl_build_get_intermediate:NN</code>	<code>\tl_build_get_intermediate:NN</code> $\langle tl\ var_1 \rangle$ $\langle tl\ var_2 \rangle$
-------	--	--

---

New: 2023-12-14

---

Stores the contents of the  $\langle tl\ var_1 \rangle$  in the  $\langle tl\ var_2 \rangle$ . The  $\langle tl\ var_1 \rangle$  must have been set up with `\tl_build_begin:N` or `\tl_build_gbegin:N`. The  $\langle tl\ var_2 \rangle$  is a “normal” token list variable, assigned locally using `\tl_set:Nn`.

## Chapter 17

# The `l3str` module Strings

`TeX` associates each character with a category code: as such, there is no concept of a “string” as commonly understood in many other programming languages. However, there are places where we wish to manipulate token lists while in some sense “ignoring” category codes: this is done by treating token lists as strings in a `TeX` sense.

A `TeX` string (and thus an `expl3` string) is a series of characters which have category code 12 (“other”) with the exception of space characters which have category code 10 (“space”). Thus at a technical level, a `TeX` string is a token list with the appropriate category codes. In this documentation, these are simply referred to as strings.

String variables are simply specialised token lists, but by convention should be named with the suffix `...str`. Such variables should contain characters with category code 12 (other), except spaces, which have category code 10 (blank space). All the functions in this module which accept a token list argument first convert it to a string using `\tl_to_str:n` for internal processing, and do not treat a token list or the corresponding string representation differently.

As a string is a subset of the more general token list, it is sometimes unclear when one should be used over the other. Use a string variable for data that isn’t primarily intended for typesetting and for which a level of protection from unwanted expansion is suitable. This data type simplifies comparison of variables since there are no concerns about expansion of their contents.

The functions `\cs_to_str:N`, `\tl_to_str:n`, `\tl_to_str:N` and `\token_to_str:N` (and variants) generate strings from the appropriate input: these are documented in `l3basics`, `l3tl` and `l3token`, respectively.

Most expandable functions in this module come in three flavours:

- `\str_...:N`, which expect a token list or string variable as their argument;
- `\str_...:n`, taking any token list (or string) as an argument;
- `\str_..._ignore_spaces:n`, which ignores any space encountered during the operation: these functions are typically faster than those which take care of escaping spaces appropriately.

## 17.1 Creating and initialising string variables

<hr/>	
<code>\str_new:N</code>	<code>\str_new:N &lt;str var&gt;</code>
<code>\str_new:c</code>	Creates a new <code>&lt;str var&gt;</code> or raises an error if the name is already taken. The declaration
<hr/>	
<code>New: 2015-09-18</code>	is global. The <code>&lt;str var&gt;</code> is initially empty.
<hr/>	
<code>\str_const:Nn</code>	<code>\str_const:Nn &lt;str var&gt; {(token list)}</code>
<code>\str_const:(NV Ne cn cV ce)</code>	Creates a new constant <code>&lt;str var&gt;</code> or raises an error if the name is already taken. The
<hr/>	
<code>New: 2015-09-18</code>	value of the <code>&lt;str var&gt;</code> is set globally to the <code>&lt;token list&gt;</code> , converted to a string.
<code>Updated: 2018-07-28</code>	
<hr/>	
<code>\str_clear:N</code>	<code>\str_clear:N &lt;str var&gt;</code>
<code>\str_clear:c</code>	Clears the content of the <code>&lt;str var&gt;</code> .
<code>\str_gclear:N</code>	
<code>\str_gclear:c</code>	
<hr/>	
<code>New: 2015-09-18</code>	
<hr/>	
<code>\str_clear_new:N</code>	<code>\str_clear_new:N &lt;str var&gt;</code>
<code>\str_clear_new:c</code>	Ensures that the <code>&lt;str var&gt;</code> exists globally by applying <code>\str_new:N</code> if necessary, then
<code>\str_gclear_new:N</code>	applies <code>\str_(g)clear:N</code> to leave the <code>&lt;str var&gt;</code> empty.
<code>\str_gclear_new:c</code>	
<hr/>	
<code>New: 2015-09-18</code>	
<hr/>	
<code>\str_set_eq:NN</code>	<code>\str_set_eq:NN &lt;str var<sub>12</sub></code>
<code>\str_set_eq:(cN Nc cc)</code>	Sets the content of <code>&lt;str var<sub>1 equal to that of <code>&lt;str var<sub>2.</sub></code></sub></code>
<code>\str_gset_eq:NN</code>	
<code>\str_gset_eq:(cN Nc cc)</code>	
<hr/>	
<code>New: 2015-09-18</code>	
<hr/>	
<code>\str_concat:NNN</code>	<code>\str_concat:NNN &lt;str var<sub>123</sub></code>
<code>\str_concat:ccc</code>	Concatenates the content of <code>&lt;str var<sub>2 and <code>&lt;str var<sub>3 together and saves the result in</sub></code></sub></code>
<code>\str_gconcat:NNN</code>	<code>&lt;str var<sub>1. The <code>&lt;str var<sub>2 is placed at the left side of the new string variable. The</sub></code></sub></code>
<code>\str_gconcat:ccc</code>	<code>&lt;str var<sub>2 and <code>&lt;str var<sub>3 must indeed be strings, as this function does not convert</sub></code></sub></code>
<hr/>	
<code>New: 2017-10-08</code>	their contents to a string.
<hr/>	
<code>\str_if_exist_p:N *</code>	<code>\str_if_exist_p:N &lt;str var&gt;</code>
<code>\str_if_exist_p:c *</code>	<code>\str_if_exist:NTF &lt;str var&gt; {(true code)} {(false code)}</code>
<code>\str_if_exist:N<del>TF</del> *</code>	Tests whether the <code>&lt;str var&gt;</code> is currently defined. This does not check that the <code>&lt;str var&gt;</code>
<code>\str_if_exist:c<del>TF</del> *</code>	really is a string.
<hr/>	
<code>New: 2015-09-18</code>	
<hr/>	

## 17.2 Adding data to string variables

---

<code>\str_set:Nn</code>	<code>\str_set:Nn &lt;str var&gt; {&lt;token list&gt;}</code>
<code>\str_set:(NV Ne cn cV ce)</code>	Converts the <code>&lt;token list&gt;</code> to a <code>&lt;string&gt;</code> , and stores the result in <code>&lt;str var&gt;</code> .
<code>\str_gset:Nn</code>	
<code>\str_gset:(NV Ne cn cV ce)</code>	

---

New: 2015-09-18  
Updated: 2018-07-28

---

---

<code>\str_put_left:Nn</code>	<code>\str_put_left:Nn &lt;str var&gt; {&lt;token list&gt;}</code>
<code>\str_put_left:(NV Ne cn cV ce)</code>	
<code>\str_gput_left:Nn</code>	
<code>\str_gput_left:(NV Ne cn cV ce)</code>	

---

New: 2015-09-18  
Updated: 2018-07-28

---

Converts the `<token list>` to a `<string>`, and prepends the result to `<str var>`. The current contents of the `<str var>` are not automatically converted to a string.

---

<code>\str_put_right:Nn</code>	<code>\str_put_right:Nn &lt;str var&gt; {&lt;token list&gt;}</code>
<code>\str_put_right:(NV Ne cn cV ce)</code>	
<code>\str_gput_right:Nn</code>	
<code>\str_gput_right:(NV Ne cn cV ce)</code>	

---

New: 2015-09-18  
Updated: 2018-07-28

---

Converts the `<token list>` to a `<string>`, and appends the result to `<str var>`. The current contents of the `<str var>` are not automatically converted to a string.

## 17.3 String conditionals

---

<code>\str_if_empty_p:N *</code>	<code>\str_if_empty_p:N &lt;str var&gt;</code>
<code>\str_if_empty_p:c *</code>	<code>\str_if_empty:NNTF &lt;str var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\str_if_empty:NTF *</code>	Tests if the <code>&lt;string variable&gt;</code> is entirely empty (i.e., contains no characters at all).
<code>\str_if_empty:cTF *</code>	
<code>\str_if_empty_p:n *</code>	
<code>\str_if_empty:nTF *</code>	

---

New: 2015-09-18  
Updated: 2022-03-21

---

---

<code>\str_if_eq_p:NN</code>	<code>\str_if_eq_p:NN &lt;str var<sub>12</sub></code>
<code>\str_if_eq_p:(Nc cN cc) *</code>	<code>\str_if_eq:NNTF &lt;str var<sub>12</sub></code>
<code>\str_if_eq:NNTF *</code>	Compares the content of two <code>&lt;str variables&gt;</code> and is logically <code>true</code> if the two contain the same characters in the same order. See <code>\tl_if_eq:NNTF</code> to compare tokens (including their category codes) rather than characters.
<code>\str_if_eq:(Nc cN cc)TF *</code>	

---

New: 2015-09-18

---

---

<code>\str_if_eq_p:nn</code>	<code>★ \str_if_eq_p:nn {&lt;tl<sub>1</sub>&gt;} {&lt;tl<sub>2</sub>&gt;}</code>
<code>\str_if_eq_p:(Vn on no nV VV vn nv ee)</code>	<code>★ \str_if_eq:nnTF {&lt;tl<sub>1</sub>&gt;} {&lt;tl<sub>2</sub>&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\str_if_eq:nnTF</code>	<code>★</code>
<code>\str_if_eq:(Vn on no nV VV vn nv ee)TF</code>	<code>★</code>

---

Updated: 2018-06-18

Compares the two *<token lists>* on a character by character basis (namely after converting them to strings), and is *true* if the two *<strings>* contain the same characters in the same order. Thus for example

`\str_if_eq_p:no { abc } { \tl_to_str:n { abc } }`

is logically *true*. See `\tl_if_eq:nnTF` to compare tokens (including their category codes) rather than characters.

---

<code>\str_if_in:NnTF</code>	<code>\str_if_in:NnTF &lt;str var&gt; {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\str_if_in:cnTF</code>	Converts the <i>&lt;token list&gt;</i> to a <i>&lt;string&gt;</i> and tests if that <i>&lt;string&gt;</i> is found in the content of the <i>&lt;str var&gt;</i> .

---

New: 2017-10-08

---

<code>\str_if_in:nnTF</code>	<code>\str_if_in:nnTF {&lt;tl<sub>1</sub>&gt;} {&lt;tl<sub>2</sub>&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
------------------------------	---

---

New: 2017-10-08

Converts both *<token lists>* to *<strings>* and tests whether *<string<sub>2 is found inside *<string<sub>1.</sub>*</sub>*

---

<code>\str_case:nn</code>	<code>★ \str_case:nnTF {&lt;test string&gt;}</code>
<code>\str_case:(Vn on en nV nv ne)</code>	<code>★ {</code>
<code>\str_case:nnTF</code>	<code>★ {&lt;string case<sub>1</sub>&gt;} {&lt;code case<sub>1</sub>&gt;}</code>
<code>\str_case:(Vn on en nV nv ne)TF</code>	<code>★ {&lt;string case<sub>2</sub>&gt;} {&lt;code case<sub>2</sub>&gt;}</code>
<code>\str_case:Nn</code>	<code>★ ...</code>
<code>\str_case:NnTF</code>	<code>★ {&lt;string case<sub>n</sub>&gt;} {&lt;code case<sub>n</sub>&gt;}</code>
	<code>}</code>
	<code>{&lt;true code&gt;}</code>
	<code>{&lt;false code&gt;}</code>

---

New: 2013-07-24  
Updated: 2022-03-21

Compares the *<test string>* in turn with each of the *<string case>*s until a match is found (all token lists are converted to strings). If the two are equal (as described for `\str_if_eq:nnTF`) then the associated *<code>* is left in the input stream and other cases are discarded. If any of the cases are matched, the *<true code>* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *<false code>* is inserted. The function `\str_case:nn`, which does nothing if there is no match, is also available.

This set of functions performs no expansion on each *<string case>* argument, so any variable in there will be compared as a string. If expansion is needed in the *<string case>*s, then `\str_case_e:nn(TF)` should be used instead.

---

<code>\str_case_e:nn</code>	★	<code>\str_case_e:nnTF {⟨test string⟩}</code>
<code>\str_case_e:en</code>	★	{
<code>\str_case_e:nnTF</code>	★	{⟨string case <sub>1</sub> ⟩} {⟨code case <sub>1</sub> ⟩}
<code>\str_case_e:enTF</code>	★	{⟨string case <sub>2</sub> ⟩} {⟨code case <sub>2</sub> ⟩}
<hr/>		...
New: 2018-06-19		{⟨string case <sub>n</sub> ⟩} {⟨code case <sub>n</sub> ⟩}
		}
		{⟨true code⟩}
		{⟨false code⟩}

---

Compares the full expansion of the `⟨test string⟩` in turn with the full expansion of the `⟨string case⟩`s (all token lists are converted to strings). If the two full expansions are equal (as described for `\str_if_eq:eeTF`) then the associated `⟨code⟩` is left in the input stream and other cases are discarded. If any of the cases are matched, the `⟨true code⟩` is also inserted into the input stream (after the code for the appropriate case), while if none match then the `⟨false code⟩` is inserted. The function `\str_case_e:nn`, which does nothing if there is no match, is also available. In `\str_case_e:nn(TF)`, the `⟨test string⟩` is expanded in each comparison, and must always yield the same result: for example, random numbers must not be used within this string.

---

<code>\str_compare_p:nNn</code>	★	<code>\str_compare_p:nNn {⟨t<sub>1</sub>⟩} ⟨relation⟩ {⟨t<sub>2</sub>⟩}</code>
<code>\str_compare_p:eNe</code>	★	<code>\str_compare:nNnTF {⟨t<sub>1</sub>⟩} ⟨relation⟩ {⟨t<sub>2</sub>⟩} {⟨true code⟩} {⟨false code⟩}</code>
<code>\str_compare:nNnTF</code>	★	Compares the two <code>⟨token lists⟩</code> on a character by character basis (namely after converting them to strings) in a lexicographic order according to the character codes of the characters. The <code>⟨relation⟩</code> can be <code>&lt;</code> , <code>=</code> , or <code>&gt;</code> and the test is <code>true</code> under the following conditions:
<code>\str_compare:eNeTF</code>	★	
New: 2021-05-17		

---

- for `<`, if the first string is earlier than the second in lexicographic order;
- for `=`, if the two strings have exactly the same characters;
- for `>`, if the first string is later than the second in lexicographic order.

Thus for example the following is logically `true`:

```
\str_compare_p:nNn { ab } < { abc }
```

**T<sub>E</sub>Xhackers note:** This is a wrapper around the T<sub>E</sub>X primitive `\(pdf)strcmp`. It is meant for programming and not for sorting textual contents, as it simply considers character codes and not more elaborate considerations of grapheme clusters, locale, etc.

## 17.4 Mapping over strings

All mappings are done at the current group level, i.e., any local assignments made by the `⟨function⟩` or `⟨code⟩` discussed below remain in effect after the loop.

<code>\str_map_function:nN</code>	☆	<code>\str_map_function:nN {⟨token list⟩} ⟨function⟩</code>
<code>\str_map_function:NN</code>	☆	<code>\str_map_function:NN ⟨str var⟩ ⟨function⟩</code>
<code>\str_map_function:cN</code>	☆	Converts the <code>⟨token list⟩</code> to a <code>⟨string⟩</code> then applies <code>⟨function⟩</code> to every <code>⟨character⟩</code>
New: 2017-11-14		in the <code>⟨string⟩</code> including spaces.

<hr/>	
<code>\str_map_inline:nn</code>	<code>\str_map_inline:nn {⟨token list⟩} {⟨inline function⟩}</code>
<code>\str_map_inline:Nn</code>	<code>\str_map_inline:Nn ⟨str var⟩ {⟨inline function⟩}</code>
<code>\str_map_inline:cn</code>	Converts the <code>⟨token list⟩</code> to a <code>⟨string⟩</code> then applies the <code>⟨inline function⟩</code> to every <code>⟨character⟩</code> in the <code>⟨str var⟩</code> including spaces. The <code>⟨inline function⟩</code> should consist of code which receives the <code>⟨character⟩</code> as <code>#1</code> .
<hr/>	
<code>\str_map_tokens:nn</code>	☆ <code>\str_map_tokens:nn {⟨token list⟩} {⟨code⟩}</code>
<code>\str_map_tokens:Nn</code>	☆ <code>\str_map_tokens:Nn ⟨str var⟩ {⟨code⟩}</code>
<code>\str_map_tokens:cn</code>	☆ Converts the <code>⟨token list⟩</code> to a <code>⟨string⟩</code> then applies <code>⟨code⟩</code> to every <code>⟨character⟩</code> in the <code>⟨string⟩</code> including spaces. The <code>⟨code⟩</code> receives each character as a trailing brace group. This is equivalent to <code>\str_map_function:nN</code> if the <code>⟨code⟩</code> consists of a single function.
<hr/>	
<code>\str_map_variable:nNn</code>	<code>\str_map_variable:nNn {⟨token list⟩} ⟨variable⟩ {⟨code⟩}</code>
<code>\str_map_variable:NNn</code>	<code>\str_map_variable:NNn ⟨str var⟩ ⟨variable⟩ {⟨code⟩}</code>
<code>\str_map_variable:cNn</code>	Converts the <code>⟨token list⟩</code> to a <code>⟨string⟩</code> then stores each <code>⟨character⟩</code> in the <code>⟨string⟩</code> (including spaces) in turn in the (string or token list) <code>⟨variable⟩</code> and applies the <code>⟨code⟩</code> . The <code>⟨code⟩</code> will usually make use of the <code>⟨variable⟩</code> , but this is not enforced. The assignments to the <code>⟨variable⟩</code> are local. Its value after the loop is the last <code>⟨character⟩</code> in the <code>⟨string⟩</code> , or its original value if the <code>⟨string⟩</code> is empty. See also <code>\str_map-inline:Nn</code> .
<hr/>	
<code>\str_map_break:</code>	☆ <code>\str_map_break:</code>
<hr/>	
<code>New: 2017-10-08</code>	Used to terminate a <code>\str_map...</code> function before all characters in the <code>⟨string⟩</code> have been processed. This normally takes place within a conditional statement, for example
<pre> \str_map_inline:Nn \l_my_str {   \str_if_eq:nnT { #1 } { bingo } { \str_map_break: }   % Do something useful } </pre>	
See also <code>\str_map_break:n</code> . Use outside of a <code>\str_map...</code> scenario leads to low level TeX errors.	
<b>TeXhackers note:</b> When the mapping is broken, additional tokens may be inserted before continuing with the code that follows the loop. This depends on the design of the mapping function.	

---

<code>\str_map_break:n</code>	☆	<code>\str_map_break:n {⟨code⟩}</code>
-------------------------------	---	--

---

New: 2017-10-08

Used to terminate a `\str_map...` function before all characters in the `⟨string⟩` have been processed, inserting the `⟨code⟩` after the mapping has ended. This normally takes place within a conditional statement, for example

```
\str_map_inline:Nn \l_my_str
{
  \str_if_eq:nnT { #1 } { bingo }
  { \str_map_break:n { <code> } }
  % Do something useful
}
```

Use outside of a `\str_map...` scenario leads to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before the `⟨code⟩` is inserted into the input stream. This depends on the design of the mapping function.

## 17.5 Working with the content of strings

---

<code>\str_use:N</code>	★	<code>\str_use:N ⟨str var⟩</code>
-------------------------	---	-----------------------------------

---

`\str_use:c` ★

New: 2015-09-18

Recovers the content of a `⟨str var⟩` and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a `⟨str⟩` directly without an accessor function.

---

<code>\str_count:N</code>	★	<code>\str_count:n {⟨token list⟩}</code>
<code>\str_count:c</code>	★	
<code>\str_count:n</code>	★	
<code>\str_count_ignore_spaces:n</code>	★	

---

New: 2015-09-18

Leaves in the input stream the number of characters in the string representation of `⟨token list⟩`, as an integer denotation. The functions differ in their treatment of spaces. In the case of `\str_count:N` and `\str_count:n`, all characters including spaces are counted. The `\str_count_ignore_spaces:n` function leaves the number of non-space characters in the input stream.

---

<code>\str_count_spaces:N</code>	★	<code>\str_count_spaces:n {⟨token list⟩}</code>
----------------------------------	---	---

---

`\str_count_spaces:c` ★

`\str_count_spaces:n` ★

New: 2015-09-18

Leaves in the input stream the number of space characters in the string representation of `⟨token list⟩`, as an integer denotation. Of course, this function has no `_ignore_spaces` variant.

---

```

\str_head:N          * \str_head:n {\token list}
\str_head:c          *
\str_head:n          *
\str_head_ignore_spaces:n *

```

---

New: 2015-09-18

---

Converts the  $\langle token list \rangle$  into a  $\langle string \rangle$ . The first character in the  $\langle string \rangle$  is then left in the input stream, with category code “other”. The functions differ if the first character is a space:  $\backslash str\_head:N$  and  $\backslash str\_head:n$  return a space token with category code 10 (blank space), while the  $\backslash str\_head\_ignore\_spaces:n$  function ignores this space character and leaves the first non-space character in the input stream. If the  $\langle string \rangle$  is empty (or only contains spaces in the case of the  $\_ignore\_spaces$  function), then nothing is left on the input stream.

---

```

\str_tail:N          * \str_tail:n {\token list}
\str_tail:c          *
\str_tail:n          *
\str_tail_ignore_spaces:n *

```

---

New: 2015-09-18

---

Converts the  $\langle token list \rangle$  to a  $\langle string \rangle$ , removes the first character, and leaves the remaining characters (if any) in the input stream, with category codes 12 and 10 (for spaces). The functions differ in the case where the first character is a space:  $\backslash str\_tail:N$  and  $\backslash str\_tail:n$  only trim that space, while  $\backslash str\_tail\_ignore\_spaces:n$  removes the first non-space character and any space before it. If the  $\langle token list \rangle$  is empty (or blank in the case of the  $\_ignore\_spaces$  variant), then nothing is left on the input stream.

---

```

\str_item:Nn         * \str_item:nn {\token list} {\integer expression}
\str_item:cn         *
\str_item:nn         *
\str_item_ignore_spaces:nn *

```

---

New: 2015-09-18

---

Converts the  $\langle token list \rangle$  to a  $\langle string \rangle$ , and leaves in the input stream the character in position  $\langle integer expression \rangle$  of the  $\langle string \rangle$ , starting at 1 for the first (left-most) character. In the case of  $\backslash str\_item:Nn$  and  $\backslash str\_item:nn$ , all characters including spaces are taken into account. The  $\backslash str\_item\_ignore\_spaces:nn$  function skips spaces when counting characters. If the  $\langle integer expression \rangle$  is negative, characters are counted from the end of the  $\langle string \rangle$ . Hence,  $-1$  is the right-most character, etc.

---

```

\str_range:Nnn      * \str_range:nnn {⟨token list⟩} {⟨start index⟩} {⟨end index⟩}
\str_range:cnn      *
\str_range:nnn      *
\str_range_ignore_spaces:nnn *

```

---

New: 2015-09-18

Converts the  $\langle token\ list \rangle$  to a  $\langle string \rangle$ , and leaves in the input stream the characters from the  $\langle start\ index \rangle$  to the  $\langle end\ index \rangle$  inclusive. Spaces are preserved and counted as items (contrast this with `\tl_range:nnn` where spaces are not counted as items and are possibly discarded from the output).

Here  $\langle start\ index \rangle$  and  $\langle end\ index \rangle$  should be integer denotations. For describing in detail the functions' behavior, let  $m$  and  $n$  be the start and end index respectively. If either is 0, the result is empty. A positive index means 'start counting from the left end', a negative index means 'start counting from the right end'. Let  $l$  be the count of the token list.

The *actual start point* is determined as  $M = m$  if  $m > 0$  and as  $M = l + m + 1$  if  $m < 0$ . Similarly the *actual end point* is  $N = n$  if  $n > 0$  and  $N = l + n + 1$  if  $n < 0$ . If  $M > N$ , the result is empty. Otherwise it consists of all items from position  $M$  to position  $N$  inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions  $s$  for  $s \leq 0$  or  $s > l$ . For instance,

```

\iow_term:e { \str_range:nnn { abcdef } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abcdef } { -4 } { -1 } }
\iow_term:e { \str_range:nnn { abcdef } { -2 } { -1 } }
\iow_term:e { \str_range:nnn { abcdef } { 0 } { -1 } }

```

prints `bcde`, `cdef`, `ef`, and an empty line to the terminal. The  $\langle start\ index \rangle$  must always be smaller than or equal to the  $\langle end\ index \rangle$ : if this is not the case then no output is generated. Thus

```

\iow_term:e { \str_range:nnn { abcdef } { 5 } { 2 } }
\iow_term:e { \str_range:nnn { abcdef } { -1 } { -4 } }

```

both yield empty strings.

The behavior of `\str_range_ignore_spaces:nnn` is similar, but spaces are removed before starting the job. The input

```

\iow_term:e { \str_range:nnn { abcdefg } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abcdefg } { 2 } { -3 } }
\iow_term:e { \str_range:nnn { abcdefg } { -6 } { 5 } }
\iow_term:e { \str_range:nnn { abcdefg } { -6 } { -3 } }

```

```

\iow_term:e { \str_range:nnn { abc~efg } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abc~efg } { 2 } { -3 } }
\iow_term:e { \str_range:nnn { abc~efg } { -6 } { 5 } }
\iow_term:e { \str_range:nnn { abc~efg } { -6 } { -3 } }

```

```

\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { 2 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { 2 } { -3 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { -6 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { -6 } { -3 } }

```

```

\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { 2 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { 2 } { -3 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { -6 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { -6 } { -3 } }

```

will print four instances of `bcde`, four instances of `bc e` and eight instances of `bcde`.

## 17.6 Modifying string variables

---

<code>\str_replace_once:Nnn</code> <code>\str_replace_once:cnn</code> <code>\str_greplace_once:Nnn</code> <code>\str_greplace_once:cnn</code>	<code>\str_replace_once:Nnn &lt;str var&gt; {&lt;old&gt;} {&lt;new&gt;}</code> Converts the <code>&lt;old&gt;</code> and <code>&lt;new&gt;</code> token lists to strings, then replaces the first (leftmost) occurrence of <code>&lt;old string&gt;</code> in the <code>&lt;str var&gt;</code> with <code>&lt;new string&gt;</code> .
--	--

---

New: 2017-10-08

---

<code>\str_replace_all:Nnn</code> <code>\str_replace_all:cnn</code> <code>\str_greplace_all:Nnn</code> <code>\str_greplace_all:cnn</code>	<code>\str_replace_all:Nnn &lt;str var&gt; {&lt;old&gt;} {&lt;new&gt;}</code> Converts the <code>&lt;old&gt;</code> and <code>&lt;new&gt;</code> token lists to strings, then replaces all occurrences of <code>&lt;old string&gt;</code> in the <code>&lt;str var&gt;</code> with <code>&lt;new string&gt;</code> . As this function operates from left to right, the pattern <code>&lt;old string&gt;</code> may remain after the replacement (see <code>\str_remove_all:Nn</code> for an example).
--	--

---

New: 2017-10-08

---

<code>\str_remove_once:Nn</code> <code>\str_remove_once:cn</code> <code>\str_gremove_once:Nn</code> <code>\str_gremove_once:cn</code>	<code>\str_remove_once:Nn &lt;str var&gt; {&lt;token list&gt;}</code> Converts the <code>&lt;token list&gt;</code> to a <code>&lt;string&gt;</code> then removes the first (leftmost) occurrence of <code>&lt;string&gt;</code> from the <code>&lt;str var&gt;</code> .
--	--

---

New: 2017-10-08

---

<code>\str_remove_all:Nn</code> <code>\str_remove_all:cn</code> <code>\str_gremove_all:Nn</code> <code>\str_gremove_all:cn</code>	<code>\str_remove_all:Nn &lt;str var&gt; {&lt;token list&gt;}</code> Converts the <code>&lt;token list&gt;</code> to a <code>&lt;string&gt;</code> then removes all occurrences of <code>&lt;string&gt;</code> from the <code>&lt;str var&gt;</code> . As this function operates from left to right, the pattern <code>&lt;string&gt;</code> may remain after the removal, for instance,
--	---

---

New: 2017-10-08

```

\str_set:Nn \l_tmpa_str {abcccd} \str_remove_all:Nn \l_tmpa_str
{bc}

```

results in `\l_tmpa_str` containing `abcd`.

## 17.7 String manipulation

---

<code>\str_lowercase:n</code>	<code>*</code>	<code>\str_lowercase:n {(tokens)}</code>
<code>\str_lowercase:f</code>	<code>*</code>	<code>\str_uppercase:n {(tokens)}</code>
<code>\str_uppercase:n</code>	<code>*</code>	Converts the input <code>{tokens}</code> to their string representation, as described for <code>\tl_to_str:n</code> , and then to the lower or upper case representation using a one-to-one mapping as described by the Unicode Consortium file <code>UnicodeData.txt</code> .
<code>\str_uppercase:f</code>	<code>*</code>	

---

New: 2019-11-26

These functions are intended for case changing programmatic data in places where upper/lower case distinctions are meaningful. One example would be automatically generating a function name from user input where some case changing is needed. In this situation the input is programmatic, not textual, case does have meaning and a language-independent one-to-one mapping is appropriate. For example

```
\cs_new_protected:Npn \myfunc:nn #1#2
{
  \cs_set_protected:cpn
  {
    user
    \str_uppercase:f { \tl_head:n {#1} }
    \str_lowercase:f { \tl_tail:n {#1} }
  }
  { #2 }
}
```

would be used to generate a function with an auto-generated name consisting of the upper case equivalent of the supplied name followed by the lower case equivalent of the rest of the input.

These functions should *not* be used for

- Caseless comparisons: use `\str_casefold:n` for this situation (case folding is distinct from lower casing).
- Case changing text for typesetting: see the `\text_lowercase:n(n)`, `\text_uppercase:n(n)` and `\text_titlecase_(all|first):n(n)` functions which correctly deal with context-dependence and other factors appropriate to text case changing.

---

`\str_casefold:n` ★ `\str_casefold:n {<tokens>}`

`\str_casefold:V` ★

---

New: 2022-10-16

Converts the input `<tokens>` to their string representation, as described for `\tl_to_str:n`, and then folds the case of the resulting `<string>` to remove case information. The result of this process is left in the input stream.

String folding is a process used for material such as identifiers rather than for “text”. The folding provided by `\str_casefold:n` follows the mappings provided by the [Unicode Consortium](#), who [state](#):

Case folding is primarily used for caseless comparison of text, such as identifiers in a computer program, rather than actual text transformation. Case folding in Unicode is based on the lowercase mapping, but includes additional changes to the source text to help make it language-insensitive and consistent. As a result, case-folded text should be used solely for internal processing and generally should not be stored or displayed to the end user.

The folding approach implemented by `\str_casefold:n` follows the “full” scheme defined by the Unicode Consortium (*e.g.* SS folds to **SS**). As case-folding is a language-insensitive process, there is no special treatment of Turkic input (i.e., I always folds to **i** and not to **ı**).

---

`\str_md5ive_hash:n` ★ `\str_md5ive_hash:n {<tokens>}`

`\str_md5ive_hash:e` ★

---

New: 2023-05-19

Expands to the MD5 sum generated from the `<tokens>`, which is converted to a `<string>` as described for `\tl_to_str:n`.

## 17.8 Viewing strings

---

`\str_show:N` `\str_show:N <str var>`

`\str_show:c`

`\str_show:n`

---

New: 2015-09-18

Updated: 2021-04-29

Displays the content of the `<str var>` on the terminal.

---

`\str_log:N` `\str_log:N <str var>`

`\str_log:c`

`\str_log:n`

---

New: 2019-02-15

Updated: 2021-04-29

Writes the content of the `<str var>` in the log file.

## 17.9 Constant strings

---

<code>\c_ampersand_str</code>	Constant strings, containing a single character token, with category code 12.
<code>\c_atsign_str</code>	
<code>\c_backslash_str</code>	
<code>\c_left_brace_str</code>	
<code>\c_right_brace_str</code>	
<code>\c_circumflex_str</code>	
<code>\c_colon_str</code>	
<code>\c_dollar_str</code>	
<code>\c_hash_str</code>	
<code>\c_percent_str</code>	
<code>\c_tilde_str</code>	
<code>\c_underscore_str</code>	
<code>\c_zero_str</code>	

---

New: 2015-09-19

Updated: 2020-12-22

---

---

<code>\c_empty_str</code>	Constant that is always empty.
---------------------------	--------------------------------

---

New: 2023-12-07

---

## 17.10 Scratch strings

---

<code>\l_tmpa_str</code>	Scratch strings for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_str</code>	

---

---

<code>\g_tmpa_str</code>	Scratch strings for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_str</code>	

---

## Chapter 18

# The l3str-convert module

## String encoding conversions

### 18.1 Encoding and escaping schemes

Traditionally, string encodings only specify how strings of characters should be stored as bytes. However, the resulting lists of bytes are often to be used in contexts where only a restricted subset of bytes are permitted (*e.g.*, PDF string objects, URLs). Hence, storing a string of characters is done in two steps.

- The code points (“character codes”) are expressed as bytes following a given “encoding”. This can be UTF-16, ISO 8859-1, etc. See Table 1 for a list of supported encodings.<sup>6</sup>
- Bytes are translated to T<sub>E</sub>X tokens through a given “escaping”. Those are defined for the most part by the pdf file format. See Table 2 for a list of escaping methods supported.<sup>6</sup>

---

<sup>6</sup>Encodings and escapings will be added as they are requested.

Table 1: Supported encodings. Non-alphanumeric characters are ignored, and capital letters are lower-cased before searching for the encoding in this list.

<i>⟨Encoding⟩</i>	description
<code>utf8</code>	UTF-8
<code>utf16</code>	UTF-16, with byte-order mark
<code>utf16be</code>	UTF-16, big-endian
<code>utf16le</code>	UTF-16, little-endian
<code>utf32</code>	UTF-32, with byte-order mark
<code>utf32be</code>	UTF-32, big-endian
<code>utf32le</code>	UTF-32, little-endian
<code>iso88591, latin1</code>	ISO 8859-1
<code>iso88592, latin2</code>	ISO 8859-2
<code>iso88593, latin3</code>	ISO 8859-3
<code>iso88594, latin4</code>	ISO 8859-4
<code>iso88595</code>	ISO 8859-5
<code>iso88596</code>	ISO 8859-6
<code>iso88597</code>	ISO 8859-7
<code>iso88598</code>	ISO 8859-8
<code>iso88599, latin5</code>	ISO 8859-9
<code>iso885910, latin6</code>	ISO 8859-10
<code>iso885911</code>	ISO 8859-11
<code>iso885913, latin7</code>	ISO 8859-13
<code>iso885914, latin8</code>	ISO 8859-14
<code>iso885915, latin9</code>	ISO 8859-15
<code>iso885916, latin10</code>	ISO 8859-16
<code>clist</code>	comma-list of integers
<code>⟨empty⟩</code>	native (Unicode) string
<code>default</code>	like <code>utf8</code> with 8-bit engines, and like native with unicode-engines

Table 2: Supported escapings. Non-alphanumeric characters are ignored, and capital letters are lower-cased before searching for the escaping in this list.

<i>⟨Escaping⟩</i>	description
<code>bytes, or empty</code>	arbitrary bytes
<code>hex, hexadecimal</code>	byte = two hexadecimal digits
<code>name</code>	see <code>\pdfescapename</code>
<code>string</code>	see <code>\pdfescapestring</code>
<code>url</code>	encoding used in URLs

## 18.2 Conversion functions

---

<code>\str_set_convert:Nnnn</code> <code>\str_gset_convert:Nnnn</code>	<code>\str_set_convert:Nnnn &lt;str var&gt; {&lt;string&gt;} {&lt;name<sub>1</sub>&gt;} {&lt;name<sub>2</sub>&gt;}</code>
---	---

---

This function converts the *<string>* from the encoding given by *<name<sub>1</sub>>* to the encoding given by *<name<sub>2</sub>>*, and stores the result in the *<str var>*. Each *<name>* can have the form *<encoding>* or *<encoding>/<escaping>*, where the possible values of *<encoding>* and *<escaping>* are given in Tables 1 and 2, respectively. The default escaping is to input and output bytes directly. The special case of an empty *<name>* indicates the use of “native” strings, 8-bit for pdfTeX, and Unicode strings for the other two engines.

For example,

```
\str_set_convert:Nnnn \l_foo_str { Hello! } { } { utf16/hex }
```

results in the variable `\l_foo_str` holding the string `FEFF00480065006C006C006F0021`. This is obtained by converting each character in the (native) string `Hello!` to the UTF-16 encoding, and expressing each byte as a pair of hexadecimal digits. Note the presence of a (big-endian) byte order mark “FEFF”, which can be avoided by specifying the encoding `utf16be/hex`.

An error is raised if the *<string>* is not valid according to the *<escaping 1>* and *<encoding 1>*, or if it cannot be reencoded in the *<encoding 2>* and *<escaping 2>* (for instance, if a character does not exist in the *<encoding 2>*). Erroneous input is replaced by the Unicode replacement character “FFFD”, and characters which cannot be reencoded are replaced by either the replacement character “FFFD” if it exists in the *<encoding 2>*, or an encoding-specific replacement character, or the question mark character.

---

<code>\str_set_convert:NnnnTF</code> <code>\str_gset_convert:NnnnTF</code>	<code>\str_set_convert:NnnnTF &lt;str var&gt; {&lt;string&gt;} {&lt;name<sub>1</sub>&gt;} {&lt;name<sub>2</sub>&gt;} {&lt;true code&gt;}</code> <code>{&lt;false code&gt;}</code>
---	--

---

As `\str_set_convert:Nnnn`, converts the *<string>* from the encoding given by *<name<sub>1</sub>>* to the encoding given by *<name<sub>2</sub>>*, and assigns the result to *<str var>*. Contrarily to `\str_set_convert:Nnnn`, the conditional variant does not raise errors in case the *<string>* is not valid according to the *<name<sub>1</sub>>* encoding, or cannot be expressed in the *<name<sub>2</sub>>* encoding. Instead, the *<false code>* is performed.

## 18.3 Conversion by expansion (for PDF contexts)

A small number of expandable functions are provided for use in PDF string/name contexts. These *assume UTF-8* and *no escaping* in the input.

---

<code>\str_convert_pdfname:n</code> ★	<code>\str_convert_pdfname:n {&lt;string&gt;}</code>
---------------------------------------	--

---

As `\str_set_convert:Nnnn`, converts the *<string>* on a byte-by-byte basis with non-ASCII codepoints escaped using hashes.

## 18.4 Possibilities, and things to do

Encoding/escaping-related tasks.

- In Xe<sub>La</sub>TeX/Lua<sub>La</sub>TeX, would it be better to use the `^^^~....` approach to build a string from a given list of character codes? Namely, within a group, assign 0-9a-f and all characters we want to category “other”, then assign `^` the category superscript, and use `\scantokens`.
- Change `\str_set_convert:Nnnn` to expand its last two arguments.
- Describe the internal format in the code comments. Refuse code points in [“D800,”DFFF] in the internal representation?
- Add documentation about each encoding and escaping method, and add examples.
- The `hex` unescaping should raise an error for odd-token count strings.
- Decide what bytes should be escaped in the `url` escaping. Perhaps the characters `! ’ ( ) * - . / 0 1 2 3 4 5 6 7 8 9 _` are safe, and all other characters should be escaped?
- Automate generation of 8-bit mapping files.
- Change the framework for 8-bit encodings: for decoding from 8-bit to Unicode, use 256 integer registers; for encoding, use a tree-box.
- More encodings (see Heiko’s `stringenc`). CESU?
- More escapings: ASCII85, shell escapes, lua escapes, etc.?

## Chapter 19

# The l3quark module

## Quarks and scan marks

Two special types of constants in L<sup>A</sup>T<sub>E</sub>X3 are “quarks” and “scan marks”. By convention all constants of type quark start out with `\q_`, and scan marks start with `\s_`.

### 19.1 Quarks

Quarks are control sequences (and in fact, token lists) that expand to themselves and should therefore *never* be executed directly in the code. This would result in an endless loop!

They are meant to be used as delimiter in weird functions, the most common use case being the ‘stop token’ (i.e., `\q_stop`). For example, when writing a macro to parse a user-defined date

```
\date_parse:n {19/June/1981}
```

one might write a command such as

```
\cs_new:Npn \date_parse:n #1 { \date_parse_aux:w #1 \q_stop }
\cs_new:Npn \date_parse_aux:w #1 / #2 / #3 \q_stop
{ <do something with the date> }
```

Quarks are sometimes also used as error return values for functions that receive erroneous input. For example, in the function `\prop_get:NnN` to retrieve a value stored in some key of a property list, if the key does not exist then the return value is the quark `\q_no_value`. As mentioned above, such quarks are extremely fragile and it is imperative when using such functions that code is carefully written to check for pathological cases to avoid leakage of a quark into an uncontrolled environment.

Quarks also permit the following ingenious trick when parsing tokens: when you pick up a token in a temporary variable and you want to know whether you have picked up a particular quark, all you have to do is compare the temporary variable to the quark using `\tl_if_eq:NNTF`. A set of special quark testing functions is set up below. All the quark testing functions are expandable although the ones testing only single tokens are much faster.

## 19.2 Defining quarks

<u><code>\quark_new:N</code></u>	<code>\quark_new:N &lt;quark&gt;</code> Creates a new <code>&lt;quark&gt;</code> which expands only to <code>&lt;quark&gt;</code> . The <code>&lt;quark&gt;</code> is defined globally, and an error message is raised if the name was already taken.
<u><code>\q_stop</code></u>	Used as a marker for delimited arguments, such as  <code>\cs_set:Npn \tmp:w #1#2 \q_stop {#1}</code>
<u><code>\q_mark</code></u>	Used as a marker for delimited arguments when <code>\q_stop</code> is already in use.
<u><code>\q_nil</code></u>	Quark to mark a null value in structured variables or functions. Used as an end delimiter when this may itself need to be tested (in contrast to <code>\q_stop</code> , which is only ever used as a delimiter).
<u><code>\q_no_value</code></u>	A canonical value for a missing value, when one is requested from a data structure. This is therefore used as a “return” value by functions such as <code>\prop_get:NnN</code> if there is no data to return.

## 19.3 Quark tests

The method used to define quarks means that the single token (N) tests are faster than the multi-token (n) tests. The latter should therefore only be used when the argument can definitely take more than a single token.

<u><code>\quark_if_nil_p:N</code></u>	<code>\quark_if_nil_p:N &lt;token&gt;</code>
<u><code>\quark_if_nil:NTF</code></u>	<code>\quark_if_nil:NTF &lt;token&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code> Tests if the <code>&lt;token&gt;</code> is equal to <code>\q_nil</code> .
<u><code>\quark_if_nil_p:n</code></u>	<code>\quark_if_nil_p:n {&lt;token list&gt;}</code>
<u><code>\quark_if_nil_p:(o V)</code></u>	<code>\quark_if_nil:nTF {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<u><code>\quark_if_nil:nTF</code></u>	<code>\quark_if_nil:nTF &lt;token list&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<u><code>\quark_if_nil:(o V)TF</code></u>	Tests if the <code>&lt;token list&gt;</code> contains only <code>\q_nil</code> (distinct from <code>&lt;token list&gt;</code> being empty or containing <code>\q_nil</code> plus one or more other tokens).
<u><code>\quark_if_no_value_p:N</code></u>	<code>\quark_if_no_value_p:N &lt;token&gt;</code>
<u><code>\quark_if_no_value_p:c</code></u>	<code>\quark_if_no_value:NTF &lt;token&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<u><code>\quark_if_no_value:NTF</code></u>	<code>\quark_if_no_value:NTF &lt;token&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<u><code>\quark_if_no_value:cTF</code></u>	Tests if the <code>&lt;token&gt;</code> is equal to <code>\q_no_value</code> .
<u><code>\quark_if_no_value_p:n</code></u>	<code>\quark_if_no_value_p:n {&lt;token list&gt;}</code>
<u><code>\quark_if_no_value:nTF</code></u>	<code>\quark_if_no_value:nTF {&lt;token list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code> Tests if the <code>&lt;token list&gt;</code> contains only <code>\q_no_value</code> (distinct from <code>&lt;token list&gt;</code> being empty or containing <code>\q_no_value</code> plus one or more other tokens).

## 19.4 Recursion

This module provides a uniform interface to intercepting and terminating loops as when one is doing tail recursion. The building blocks follow below and an example is shown in Section [19.4.1](#).

---

`\q_recursion_tail` This quark is appended to the data structure in question and appears as a real element there. This means it gets any list separators around it.

---

`\q_recursion_stop` This quark is added *after* the data structure. Its purpose is to make it possible to terminate the recursion at any point easily.

---

`\quark_if_recursion_tail_stop:N * \quark_if_recursion_tail_stop:N <token>`

Tests if `<token>` contains only the marker `\q_recursion_tail`, and if so uses `\use_none_delimit_by_q_recursion_stop:w` to terminate the recursion that this belongs to. The recursion input must include the marker tokens `\q_recursion_tail` and `\q_recursion_stop` as the last two items.

---

`\quark_if_recursion_tail_stop:n * \quark_if_recursion_tail_stop:n {<token list>}`  
`\quark_if_recursion_tail_stop:o *`

Updated: 2011-09-06

Tests if the `<token list>` contains only `\q_recursion_tail`, and if so uses `\use_none_delimit_by_q_recursion_stop:w` to terminate the recursion that this belongs to. The recursion input must include the marker tokens `\q_recursion_tail` and `\q_recursion_stop` as the last two items.

---

`\quark_if_recursion_tail_stop_do:Nn * \quark_if_recursion_tail_stop_do:Nn <token> {<insertion>}`

Tests if `<token>` contains only the marker `\q_recursion_tail`, and if so uses `\use_i_delimit_by_q_recursion_stop:w` to terminate the recursion that this belongs to. The recursion input must include the marker tokens `\q_recursion_tail` and `\q_recursion_stop` as the last two items. The `<insertion>` code is then added to the input stream after the recursion has ended.

---

`\quark_if_recursion_tail_stop_do:nn * \quark_if_recursion_tail_stop_do:nn {<token list>} {<insertion>}`  
`\quark_if_recursion_tail_stop_do:on *`

Updated: 2011-09-06

Tests if the `<token list>` contains only `\q_recursion_tail`, and if so uses `\use_i_delimit_by_q_recursion_stop:w` to terminate the recursion that this belongs to. The recursion input must include the marker tokens `\q_recursion_tail` and `\q_recursion_stop` as the last two items. The `<insertion>` code is then added to the input stream after the recursion has ended.

---

```
\quark_if_recursion_tail_break:Nn * \quark_if_recursion_tail_break:nN {\token list} \type_map_break:
\quark_if_recursion_tail_break:nN *
```

---

New: 2018-04-10

---

Tests if  $\langle token list \rangle$  contains only  $\backslash q\_recursion\_tail$ , and if so terminates the recursion using  $\backslash \langle type \rangle\_map\_break:.$  The recursion end should be marked by  $\backslash prg\_break\_point:Nn \backslash \langle type \rangle\_map\_break:.$

### 19.4.1 An example of recursion with quarks

Quarks are mainly used internally in the `expl3` code to define recursion functions such as `\tl_map_inline:nn` and so on. Here is a small example to demonstrate how to use quarks in this fashion. We shall define a command called `\my_map_dbl:nn` which takes a token list and applies an operation to every *pair* of tokens. For example, `\my_map_dbl:nn {abcd} {[--#1--#2--]~}` would produce “`[-a-b-] [-c-d-]`”. Using quarks to define such functions simplifies their logic and ensures robustness in many cases.

Here’s the definition of `\my_map_dbl:nn`. First of all, define the function that does the processing based on the inline function argument #2. Then initiate the recursion using an internal function. The token list #1 is terminated using `\q_recursion_tail`, with delimiters according to the type of recursion (here a pair of `\q_recursion_tail`), concluding with `\q_recursion_stop`. These quarks are used to mark the end of the token list being operated upon.

```
\cs_new:Npn \my_map_dbl:nn #1#2
{
  \cs_set:Npn \__my_map_dbl_fn:nn ##1 ##2 {#2}
  \__my_map_dbl:nn #1 \q_recursion_tail \q_recursion_tail
  \q_recursion_stop
}
```

The definition of the internal recursion function follows. First check if either of the input tokens are the termination quarks. Then, if not, apply the inline function to the two arguments.

```
\cs_new:Nn \__my_map_dbl:nn
{
  \quark_if_recursion_tail_stop:n {#1}
  \quark_if_recursion_tail_stop:n {#2}
  \__my_map_dbl_fn:nn {#1} {#2}
}
```

Finally, recurse:

```
  \__my_map_dbl:nn
}
```

Note that contrarily to L<sup>A</sup>T<sub>E</sub>X3 built-in mapping functions, this mapping function cannot be nested, since the second map would overwrite the definition of `\__my_map_dbl_fn:nn`.

## 19.5 Scan marks

Scan marks are control sequences set equal to `\scan_stop:`, hence never expand in an expansion context and are (largely) invisible if they are encountered in a typesetting context.

Like quarks, they can be used as delimiters in weird functions and are often safer to use for this purpose. Since they are harmless when executed by  $\text{\TeX}$  in non-expandable contexts, they can be used to mark the end of a set of instructions. This allows to skip to that point if the end of the instructions should not be performed (see `l3regex`).

---

<code>\scan_new:N</code>	<code>\scan_new:N</code> $\langle scan\ mark \rangle$
--------------------------	---

---

New: 2018-04-01	Creates a new $\langle scan\ mark \rangle$ which is set equal to <code>\scan_stop:</code> . The $\langle scan\ mark \rangle$ is defined globally, and an error message is raised if the name was already taken by another scan mark.
-----------------	--

---

---

<code>\s_stop</code>	Used at the end of a set of instructions, as a marker that can be jumped to using <code>\use_none_delimit_by_s_stop:w</code> .
----------------------	--

---

New: 2018-04-01	
-----------------	--

---

---

<code>\use_none_delimit_by_s_stop:w</code> $\star$ <code>\use_none_delimit_by_s_stop:w</code> $\langle tokens \rangle$ <code>\s_stop</code>
---

---

New: 2018-04-01
-----------------

---

Removes the  $\langle tokens \rangle$  and `\s_stop` from the input stream. This leads to a low-level  $\text{\TeX}$  error if `\s_stop` is absent.

## Chapter 20

# The l3seq module

## Sequences and stacks

L<sup>A</sup>T<sub>E</sub>X3 implements a “sequence” data type, which contain an ordered list of entries which may contain any *⟨balanced text⟩*. It is possible to map functions to sequences such that the function is applied to every item in the sequence.

Sequences are also used to implement stack functions in L<sup>A</sup>T<sub>E</sub>X3. This is achieved using a number of dedicated stack functions.

### 20.1 Creating and initialising sequences

---

<code>\seq_new:N</code>	<code>\seq_new:N &lt;seq var&gt;</code>
<code>\seq_new:c</code>	Creates a new <i>⟨seq var⟩</i> or raises an error if the name is already taken. The declaration is global. The <i>⟨seq var⟩</i> initially contains no items.

---

---

<code>\seq_clear:N</code>	<code>\seq_clear:N &lt;seq var&gt;</code>
<code>\seq_clear:c</code>	Clears all items from the <i>⟨seq var⟩</i> .
<code>\seq_gclear:N</code>	
<code>\seq_gclear:c</code>	

---

---

<code>\seq_clear_new:N</code>	<code>\seq_clear_new:N &lt;seq var&gt;</code>
<code>\seq_clear_new:c</code>	Ensures that the <i>⟨seq var⟩</i> exists globally by applying <code>\seq_new:N</code> if necessary, then applies <code>\seq_(g)clear:N</code> to leave the <i>⟨seq var⟩</i> empty.
<code>\seq_gclear_new:N</code>	
<code>\seq_gclear_new:c</code>	

---

---

<code>\seq_set_eq:NN</code>	<code>\seq_set_eq:NN &lt;seq var<sub>1</sub>&gt; &lt;seq var<sub>2</sub>&gt;</code>
<code>\seq_set_eq:(cN Nc cc)</code>	Sets the content of <i>⟨seq var<sub>1</sub>⟩</i> equal to that of <i>⟨seq var<sub>2</sub>⟩</i> .
<code>\seq_gset_eq:NN</code>	
<code>\seq_gset_eq:(cN Nc cc)</code>	

---

---

<code>\seq_set_from_clist:NN</code>	<code>\seq_set_from_clist:NN &lt;seq var&gt; &lt;clist var&gt;</code>
<code>\seq_set_from_clist:(cN Nc cc)</code>	
<code>\seq_set_from_clist:Nn</code>	
<code>\seq_set_from_clist:cn</code>	
<code>\seq_gset_from_clist:NN</code>	
<code>\seq_gset_from_clist:(cN Nc cc)</code>	
<code>\seq_gset_from_clist:Nn</code>	
<code>\seq_gset_from_clist:cn</code>	

---

New: 2014-07-17

Converts the data in the `<clist var>` into a `<seq var>`: the original `<clist var>` is unchanged.

---

<code>\seq_const_from_clist:Nn</code>	<code>\seq_const_from_clist:Nn &lt;seq var&gt; {&lt;comma-list&gt;}</code>
<code>\seq_const_from_clist:cn</code>	

---

New: 2017-11-28

Creates a new constant `<seq var>` or raises an error if the name is already taken. The `<seq var>` is set globally to contain the items in the `<comma list>`.

---

<code>\seq_set_split:Nnn</code>	<code>\seq_set_split:Nnn &lt;seq var&gt; {&lt;delimiter&gt;} {&lt;token list&gt;}</code>
<code>\seq_set_split:(NVn NnV NVV Nne Nee)</code>	
<code>\seq_gset_split:Nnn</code>	
<code>\seq_gset_split:(NVn NnV NVV Nne Nee)</code>	

---

New: 2011-08-15

Updated: 2012-07-02

Splits the `<token list>` into `<items>` separated by `<delimiter>`, and assigns the result to the `<seq var>`. Spaces on both sides of each `<item>` are ignored, then one set of outer braces is removed (if any); this space trimming behaviour is identical to that of `\l3clist` functions. Empty `<items>` are preserved by `\seq_set_split:Nnn`, and can be removed afterwards using `\seq_remove_all:Nn <seq var> {}`. The `<delimiter>` may not contain `{, }` or `#` (assuming T<sub>E</sub>X's normal category code régime). If the `<delimiter>` is empty, the `<token list>` is split into `<items>` as described for `\tl_map_function:nN`. See also `\seq_set_split_keep_spaces:Nnn`, which omits space stripping.

---

<code>\seq_set_split_keep_spaces:Nnn</code>	<code>\seq_set_split_keep_spaces:Nnn &lt;seq var&gt; {&lt;delimiter&gt;} {&lt;token list&gt;}</code>
<code>\seq_set_split_keep_spaces:NnV</code>	
<code>\seq_gset_split_keep_spaces:Nnn</code>	
<code>\seq_gset_split_keep_spaces:NnV</code>	

---

New: 2021-03-24

Splits the `<token list>` into `<items>` separated by `<delimiter>`, and assigns the result to the `<seq var>`. One set of outer braces is removed (if any) but any surrounding spaces are retained: any braces *inside* one or more spaces are therefore kept. Empty `<items>` are preserved by `\seq_set_split_keep_spaces:Nnn`, and can be removed afterwards using `\seq_remove_all:Nn <seq var> {}`. The `<delimiter>` may not contain `{, }` or `#` (assuming T<sub>E</sub>X's normal category code régime). If the `<delimiter>` is empty, the `<token list>` is split into `<items>` as described for `\tl_map_function:nN`; note in this case spaces will *not* be preserved. See also `\seq_set_split:Nnn`, which removes spaces around the delimiters.

<code>\seq_set_filter:Nnn</code>	<code>\seq_set_filter:Nnn &lt;seq var<sub>1</sub>&gt; &lt;seq var<sub>2</sub>&gt; {&lt;inline boolexpr&gt;}</code>
<code>\seq_gset_filter:NNn</code>	Evaluates the <code>&lt;inline boolexpr&gt;</code> for every <code>&lt;item&gt;</code> stored within the <code>&lt;seq var<sub>2</sub>&gt;</code> . The <code>&lt;inline boolexpr&gt;</code> receives the <code>&lt;item&gt;</code> as #1. The sequence of all <code>&lt;items&gt;</code> for which the <code>&lt;inline boolexpr&gt;</code> evaluated to <code>true</code> is assigned to <code>&lt;seq var<sub>1</sub>&gt;</code> .
New: 2012-06-15	

**T<sub>E</sub>Xhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level T<sub>E</sub>X errors.

<code>\seq_set_regex_extract_once:Nnn</code>	<code>\seq_set_regex_extract_once:Nnn &lt;seq var&gt; {&lt;regex&gt;} {&lt;token list&gt;}</code>
<code>\seq_set_regex_extract_once:cnn</code>	<code>\seq_set_regex_extract_once:NNn &lt;seq var&gt; &lt;regex var&gt; {&lt;token list&gt;}</code>
<code>\seq_set_regex_extract_once:NNn</code>	
<code>\seq_set_regex_extract_once:cNn</code>	
<code>\seq_gset_regex_extract_once:Nnn</code>	
<code>\seq_gset_regex_extract_once:cnn</code>	
<code>\seq_gset_regex_extract_once:NNn</code>	
<code>\seq_gset_regex_extract_once:cNn</code>	

New: 2024-12-08

Finds the first match of the `<regex>` in the `<token list>`. If it exists, the match is stored as the first item of the `<seq var>`, and further items are the contents of capturing groups, in the order of their opening parenthesis. If there is no match, the `<seq var>` is cleared. Theses are alternative names for `\regex_extract_once:nnN` and friends, with arguments re-ordered for `<seq var>` setting; see `l3regex` chapter for more details of the `<regex>` format.

<code>\seq_set_regex_extract_all:Nnn</code>	<code>\seq_set_regex_extract_all:Nnn &lt;seq var&gt; {&lt;regex&gt;} {&lt;token list&gt;}</code>
<code>\seq_set_regex_extract_all:cnn</code>	<code>\seq_set_regex_extract_all:NNn &lt;seq var&gt; &lt;regex var&gt; {&lt;token list&gt;}</code>
<code>\seq_set_regex_extract_all:NNn</code>	
<code>\seq_set_regex_extract_all:cNn</code>	
<code>\seq_gset_regex_extract_all:Nnn</code>	
<code>\seq_gset_regex_extract_all:cnn</code>	
<code>\seq_gset_regex_extract_all:NNn</code>	
<code>\seq_gset_regex_extract_all:cNn</code>	

New: 2024-12-08

Finds all matches of the `<regex>` in the `<token list>`, and stores all the submatch information in a single sequence (concatenating the results of multiple `\seq_set_regex_extract_all:Nnn` calls). If there is no match, the `<seq var>` is cleared. Theses are alternative names for `\regex_extract_all:nnN` and friends, with arguments re-ordered for `<seq var>` setting; see `l3regex` chapter for more details of the `<regex>` format.

---

```

\seq_set_regex_split:Nnn
\seq_set_regex_split:cnn
\seq_set_regex_split:NNn
\seq_set_regex_split:cNn
\seq_gset_regex_split:Nnn
\seq_gset_regex_split:cnn
\seq_gset_regex_split:NNn
\seq_gset_regex_split:cNn

```

---

New: 2024-12-08

```

\seq_set_regex_split:Nnn <seq var> {(regex)} {<token list>}
\seq_set_regex_split:NNn <seq var> <regex var> {<token list>}

```

Splits the  $\langle token\ list \rangle$  into a sequence of parts, delimited by matches of the  $\langle regular\ expression \rangle$ . If the  $\langle regular\ expression \rangle$  has capturing groups, then the token lists that they match are stored as items of the sequence as well. If no match is found the resulting  $\langle seq\ var \rangle$  has the  $\langle token\ list \rangle$  as its sole item. If the  $\langle regular\ expression \rangle$  matches the empty token list, then the  $\langle token\ list \rangle$  is split into single tokens. For example, after

```
\seq_set_regex_split:Nnn \l_path_seq { / } { the/path/for/this/file.tex }
```

the sequence  $\l_path_seq$  contains the items  $\{the\}$ ,  $\{path\}$ ,  $\{for\}$ ,  $\{this\}$ , and  $\{file.tex\}$ . Theses are alternative names for  $\backslash regex\_split:nnN$  and friends, with arguments re-ordered for  $\langle seq\ var \rangle$  setting; see `l3regex` chapter for more details of the  $\langle regex \rangle$  format.

---

```

\seq_concat:NNN
\seq_concat:ccc
\seq_gconcat:NNN
\seq_gconcat:ccc

```

---

```
\seq_concat:NNN <seq var1> <seq var2> <seq var3>
```

Concatenates the content of  $\langle seq\ var_2 \rangle$  and  $\langle seq\ var_3 \rangle$  together and saves the result in  $\langle seq\ var_1 \rangle$ . The items in  $\langle seq\ var_2 \rangle$  are placed at the left side of the new sequence.

---

```

\seq_if_exist_p:N * \seq_if_exist_p:N <seq var>
\seq_if_exist_p:c * \seq_if_exist:NTF <seq var> {(true code)} {(false code)}
\seq_if_exist:NTF *
\seq_if_exist:cTF *

```

---

Tests whether the  $\langle seq\ var \rangle$  is currently defined. This does not check that the  $\langle seq\ var \rangle$  really is a sequence variable.

New: 2012-03-03

## 20.2 Appending data to sequences

---

```

\seq_put_left:Nn
\seq_put_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
\seq_gput_left:Nn
\seq_gput_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)

```

---

Appends the  $\langle item \rangle$  to the left of the  $\langle seq\ var \rangle$ .

---

```

\seq_put_right:Nn
\seq_put_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
\seq_gput_right:Nn
\seq_gput_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)

```

---

Appends the  $\langle item \rangle$  to the right of the  $\langle seq\ var \rangle$ .

## 20.3 Recovering items from sequences

Items can be recovered from either the left or the right of sequences. For implementation reasons, the actions at the left of the sequence are faster than those acting on the right.

These functions all assign the recovered material locally, i.e., setting the  $\langle \text{tl var} \rangle$  used with  $\backslash \text{tl\_set:Nn}$  and *never*  $\backslash \text{tl\_gset:Nn}$ .

---

$\backslash \text{seq\_get\_left:Nn}$	$\backslash \text{seq\_get\_left:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_get\_left:cN}$	Stores the left-most item from a $\langle \text{seq var} \rangle$ in the $\langle \text{tl var} \rangle$ without removing it from the $\langle \text{seq var} \rangle$ . The $\langle \text{tl var} \rangle$ is assigned locally. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-14	

---

---

$\backslash \text{seq\_get\_right:Nn}$	$\backslash \text{seq\_get\_right:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_get\_right:cN}$	Stores the right-most item from a $\langle \text{seq var} \rangle$ in the $\langle \text{tl var} \rangle$ without removing it from the $\langle \text{seq var} \rangle$ . The $\langle \text{tl var} \rangle$ is assigned locally. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-19	

---

---

$\backslash \text{seq\_pop\_left:Nn}$	$\backslash \text{seq\_pop\_left:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_pop\_left:cN}$	Pops the left-most item from a $\langle \text{seq var} \rangle$ into the $\langle \text{tl var} \rangle$ , i.e., removes the item from the sequence and stores it in the $\langle \text{tl var} \rangle$ . Both of the variables are assigned locally. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-14	

---

---

$\backslash \text{seq\_gpop\_left:Nn}$	$\backslash \text{seq\_gpop\_left:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_gpop\_left:cN}$	Pops the left-most item from a $\langle \text{seq var} \rangle$ into the $\langle \text{tl var} \rangle$ , i.e., removes the item from the sequence and stores it in the $\langle \text{tl var} \rangle$ . The $\langle \text{seq var} \rangle$ is modified globally, while the assignment of the $\langle \text{tl var} \rangle$ is local. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-14	

---

---

$\backslash \text{seq\_pop\_right:Nn}$	$\backslash \text{seq\_pop\_right:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_pop\_right:cN}$	Pops the right-most item from a $\langle \text{seq var} \rangle$ into the $\langle \text{tl var} \rangle$ , i.e., removes the item from the sequence and stores it in the $\langle \text{tl var} \rangle$ . Both of the variables are assigned locally. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-19	

---

---

$\backslash \text{seq\_gpop\_right:Nn}$	$\backslash \text{seq\_gpop\_right:Nn} \langle \text{seq var} \rangle \langle \text{tl var} \rangle$
$\backslash \text{seq\_gpop\_right:cN}$	Pops the right-most item from a $\langle \text{seq var} \rangle$ into the $\langle \text{tl var} \rangle$ , i.e., removes the item from the sequence and stores it in the $\langle \text{tl var} \rangle$ . The $\langle \text{seq var} \rangle$ is modified globally, while the assignment of the $\langle \text{tl var} \rangle$ is local. If $\langle \text{seq var} \rangle$ is empty the $\langle \text{tl var} \rangle$ is set to the special marker $\backslash \text{q\_no\_value}$ .
Updated: 2012-05-19	

---

---

$\backslash \text{seq\_item:Nn}$	$\star \backslash \text{seq\_item:Nn} \langle \text{seq var} \rangle \{ \langle \text{integer expression} \rangle \}$
$\backslash \text{seq\_item:(NV Ne cn cV ce)} \star$	Indexing items in the $\langle \text{seq var} \rangle$ from 1 at the top (left), this function evaluates the $\langle \text{integer expression} \rangle$ and leaves the appropriate item from the sequence in the input stream. If the $\langle \text{integer expression} \rangle$ is negative, indexing occurs from the bottom (right) of the sequence. If the $\langle \text{integer expression} \rangle$ is larger than the number of items in the $\langle \text{seq var} \rangle$ (as calculated by $\backslash \text{seq\_count:N}$ ) then the function expands to nothing.
New: 2014-07-17	

---

**TeXhackers note:** The result is returned within the  $\backslash \text{unexpanded}$  primitive ( $\backslash \text{exp\_not:n}$ ), which means that the  $\langle \text{item} \rangle$  does not expand further when appearing in an e-type or x-type argument expansion.

<u>\seq_rand_item:N</u> *	\seq_rand_item:N <seq var>
<u>\seq_rand_item:c</u> *	Selects a pseudo-random item of the <seq var>. If the <seq var> is empty the result is empty.
New: 2016-12-06	

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the <item> does not expand further when appearing in an **e**-type or **x**-type argument expansion.

## 20.4 Recovering values from sequences with branching

The functions in this section combine tests for non-empty sequences with recovery of an item from the sequence. They offer increased readability and performance over separate testing and recovery phases.

<u>\seq_get_left:NNTF</u>	\seq_get_left:NNTF <seq var> <tl var> {<true code>} {<false code>}
<u>\seq_get_left:cNTF</u>	If the <seq var> is empty, leaves the <false code> in the input stream. The value of the <tl var> is not defined in this case and should not be relied upon. If the <seq var> is non-empty, stores the left-most item from the <seq var> in the <tl var> without removing it from the <seq var>, then leaves the <true code> in the input stream. The <tl var> is assigned locally.
New: 2012-05-14	
Updated: 2012-05-19	

<u>\seq_get_right:NNTF</u>	\seq_get_right:NNTF <seq var> <tl var> {<true code>} {<false code>}
<u>\seq_get_right:cNTF</u>	If the <seq var> is empty, leaves the <false code> in the input stream. The value of the <tl var> is not defined in this case and should not be relied upon. If the <seq var> is non-empty, stores the right-most item from the <seq var> in the <tl var> without removing it from the <seq var>, then leaves the <true code> in the input stream. The <tl var> is assigned locally.
New: 2012-05-19	

<u>\seq_pop_left:NNTF</u>	\seq_pop_left:NNTF <seq var> <tl var> {<true code>} {<false code>}
<u>\seq_pop_left:cNTF</u>	If the <seq var> is empty, leaves the <false code> in the input stream. The value of the <tl var> is not defined in this case and should not be relied upon. If the <seq var> is non-empty, pops the left-most item from the <seq var> in the <tl var>, i.e., removes the item from the <seq var>, then leaves the <true code> in the input stream. Both the <seq var> and the <tl var> are assigned locally.

## 20.5 Modifying sequences

While sequences are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update sequences, while retaining the order of the unaffected entries.

<hr/>	<hr/>
<code>\seq_remove_duplicates:N</code>	<code>\seq_remove_duplicates:N &lt;seq var&gt;</code>
<code>\seq_remove_duplicates:c</code>	
<code>\seq_gremove_duplicates:N</code>	Removes duplicate items from the <code>&lt;seq var&gt;</code> , leaving the left most copy of each item in the <code>&lt;seq var&gt;</code> . The <code>&lt;item&gt;</code> comparison takes place on a token basis, as for <code>\tl_if_eq:nnTF</code> .
<code>\seq_gremove_duplicates:c</code>	

**TeXhackers note:** This function iterates through every item in the `<seq var>` and does a comparison with the `<items>` already checked. It is therefore relatively slow with large sequences.

<hr/>	<hr/>
<code>\seq_remove_all:Nn</code>	<code>\seq_remove_all:Nn &lt;seq var&gt; {(item)}</code>
<code>\seq_remove_all:(NV Ne cn cV ce)</code>	
<code>\seq_gremove_all:Nn</code>	
<code>\seq_gremove_all:(NV Ne cn cV ce)</code>	

Removes every occurrence of `<item>` from the `<seq var>`. The `<item>` comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

<hr/>	<hr/>
<code>\seq_set_item:Nnn</code>	<code>\seq_set_item:Nnn &lt;seq var&gt; {(int expr)} {(item)}</code>
<code>\seq_set_item:cnn</code>	<code>\seq_set_item:NnnTF &lt;seq var&gt; {(int expr)} {(item)} {(true code)} {(false code)}</code>
<code>\seq_set_item:NnnTF</code>	
<code>\seq_set_item:cnnTF</code>	Removes the item of <code>&lt;seq var&gt;</code> at the position given by evaluating the <code>&lt;int expr&gt;</code> and replaces it by <code>&lt;item&gt;</code> . Items are indexed from 1 on the left/top of the <code>&lt;seq var&gt;</code> , or from <code>-1</code> on the right/bottom. If the <code>&lt;int expr&gt;</code> is zero or is larger (in absolute value) than the number of items in the sequence, the <code>&lt;seq var&gt;</code> is not modified. In these cases, <code>\seq_set_item:Nnn</code> raises an error while <code>\seq_set_item:NnnTF</code> runs the <code>&lt;false code&gt;</code> .
<code>\seq_gset_item:Nnn</code>	
<code>\seq_gset_item:cnn</code>	
<code>\seq_gset_item:NnnTF</code>	
<code>\seq_gset_item:cnnTF</code>	In cases where the assignment was successful, <code>&lt;true code&gt;</code> is run afterwards.

---

```
\seq_reverse:N
\seq_reverse:c
\seq_greverse:N
\seq_greverse:c
```

---

New: 2014-07-18

---

`\seq_reverse:N`  $\langle seq\ var \rangle$   
Reverses the order of the items stored in the  $\langle seq\ var \rangle$ .

---

```
\seq_sort:Nn
\seq_sort:cn
\seq_gsort:Nn
\seq_gsort:cn
```

---

New: 2017-02-06

---

`\seq_sort:Nn`  $\langle seq\ var \rangle$   $\{ \langle comparison\ code \rangle \}$   
Sorts the items in the  $\langle seq\ var \rangle$  according to the  $\langle comparison\ code \rangle$ , and assigns the result to  $\langle seq\ var \rangle$ . The details of sorting comparison are described in Section 6.1.

---

```
\seq_shuffle:N
\seq_shuffle:c
\seq_gshuffle:N
\seq_gshuffle:c
```

---

New: 2018-04-29

---

`\seq_shuffle:N`  $\langle seq\ var \rangle$   
Sets the  $\langle seq\ var \rangle$  to the result of placing the items of the  $\langle seq\ var \rangle$  in a random order. Each item is (roughly) as likely to end up in any given position.

**T<sub>E</sub>Xhackers note:** For sequences with more than 13 items or so, only a small proportion of all possible permutations can be reached, because the random seed `\sys_rand_seed` only has 28-bits. The use of `\toks` internally means that sequences with more than 32767 or 65535 items (depending on the engine) cannot be shuffled.

## 20.6 Sequence conditionals

---

```
\seq_if_empty_p:N * \seq_if_empty_p:N \langle seq\ var \rangle
\seq_if_empty_p:c * \seq_if_empty:NtF \langle seq\ var \rangle \{ \langle true\ code \rangle \} \{ \langle false\ code \rangle \}
\seq_if_empty:NtF *
\seq_if_empty:cTF *
```

---

Tests if the  $\langle seq\ var \rangle$  is empty (containing no items).

---

```
\seq_if_in:NnTF \seq_if_in:NnTF \langle seq\ var \rangle \{ \langle item \rangle \} \{ \langle true\ code \rangle \} \{ \langle false\ code \rangle \}
\seq_if_in:(NV|Nv|Ne|No|cn|cV|cv|ce|co)TF
```

---

Tests if the  $\langle item \rangle$  is present in the  $\langle seq\ var \rangle$ .

## 20.7 Mapping over sequences

All mappings are done at the current group level, i.e., any local assignments made by the  $\langle function \rangle$  or  $\langle code \rangle$  discussed below remain in effect after the loop.

---

```
\seq_map_function:NN ☆ \seq_map_function:NN \langle seq\ var \rangle \langle function \rangle
\seq_map_function:cN ☆
```

---

Updated: 2012-06-29

---

Applies  $\langle function \rangle$  to every  $\langle item \rangle$  stored in the  $\langle seq\ var \rangle$ . The  $\langle function \rangle$  will receive one argument for each iteration. The  $\langle items \rangle$  are returned from left to right. To pass further arguments to the  $\langle function \rangle$ , see `\seq_map_tokens:Nn`. The function `\seq_map_inline:Nn` is faster than `\seq_map_function:NN` for sequences with more than about 10 items.

---

<code>\seq_map_inline:Nn</code>	<code>\seq_map_inline:Nn &lt;seq var&gt; {(inline function)}</code>
<code>\seq_map_inline:cn</code>	Applies <i>&lt;inline function&gt;</i> to every <i>&lt;item&gt;</i> stored within the <i>&lt;seq var&gt;</i> . The <i>&lt;inline function&gt;</i> should consist of code which will receive the <i>&lt;item&gt;</i> as #1. The <i>&lt;items&gt;</i> are returned from left to right.
Updated: 2012-06-29	

---

---

<code>\seq_map_tokens:Nn</code> ☆	<code>\seq_map_tokens:Nn &lt;seq var&gt; {(code)}</code>
<code>\seq_map_tokens:cn</code> ☆	Analogue of <code>\seq_map_function:NN</code> which maps several tokens instead of a single function. The <i>&lt;code&gt;</i> receives each item in the <i>&lt;seq var&gt;</i> as a trailing brace group. For instance,
New: 2019-08-30	

---

`\seq_map_tokens:Nn \l_my_seq { \prg_replicate:nn { 2 } }`

expands to twice each item in the *<seq var>*: for each item in `\l_my_seq` the function `\prg_replicate:nn` receives 2 and *<item>* as its two arguments. The function `\seq_map_inline:Nn` is typically faster but it is not expandable.

---

<code>\seq_map_variable:NNn</code>	<code>\seq_map_variable:NNn &lt;seq var&gt; &lt;variable&gt; {(code)}</code>
<code>\seq_map_variable:(Ncn cNn ccn)</code>	
Updated: 2012-06-29	

---

Stores each *<item>* of the *<seq var>* in turn in the (token list) *<variable>* and applies the *<code>*. The *<code>* will usually make use of the *<variable>*, but this is not enforced. The assignments to the *<variable>* are local. Its value after the loop is the last *<item>* in the *<seq var>*, or its original value if the *<seq var>* is empty. The *<items>* are returned from left to right.

---

<code>\seq_map_indexed_function:NN</code> ☆	<code>\seq_map_indexed_function:NN &lt;seq var&gt; &lt;function&gt;</code>
New: 2018-05-03	

---

Applies *<function>* to every entry in the *<seq var>*. The *<function>* should have signature `:nn`. It receives two arguments for each iteration: the *<index>* (namely 1 for the first entry, then 2 and so on) and the *<item>*.

---

<code>\seq_map_indexed_inline:Nn</code>	<code>\seq_map_indexed_inline:Nn &lt;seq var&gt; {(inline function)}</code>
New: 2018-05-03	

---

Applies *<inline function>* to every entry in the *<seq var>*. The *<inline function>* should consist of code which receives the *<index>* (namely 1 for the first entry, then 2 and so on) as #1 and the *<item>* as #2.

---

<code>\seq_map_pairwise_function:NNN</code> ☆	<code>\seq_map_pairwise_function:NNN &lt;seq var<sub>1</sub>&gt; &lt;seq var<sub>2</sub>&gt; &lt;function&gt;</code>
<code>\seq_map_pairwise_function:(NcN cNN ccN)</code> ☆	
New: 2023-05-10	

---

Applies *<function>* to every pair of items *<seq var<sub>1</sub>-item>*–*<seq var<sub>2</sub>-item>* from the two sequences, returning items from both sequences from left to right. The *<function>* receives two n-type arguments for each iteration. The mapping terminates when the end of either sequence is reached (i.e., whichever sequence has fewer items determines how many iterations occur).

<hr/> <code>\seq_map_break:</code> ☆	<code>\seq_map_break:</code>
<hr/> Updated: 2012-06-29	Used to terminate a <code>\seq_map...</code> function before all entries in the $\langle seq\ var \rangle$ have been processed. This normally takes place within a conditional statement, for example

```

\seq_map_inline:Nn \l_my_seq
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \seq_map_break: }
  {
    % Do something useful
  }
}

```

Use outside of a `\seq_map...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

<hr/> <code>\seq_map_break:n</code> ☆	<code>\seq_map_break:n {&lt;code&gt;}</code>
<hr/> Updated: 2012-06-29	Used to terminate a <code>\seq_map...</code> function before all entries in the $\langle seq\ var \rangle$ have been processed, inserting the $\langle code \rangle$ after the mapping has ended. This normally takes place within a conditional statement, for example

```

\seq_map_inline:Nn \l_my_seq
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \seq_map_break:n { <code> } }
  {
    % Do something useful
  }
}

```

Use outside of a `\seq_map...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before the  $\langle code \rangle$  is inserted into the input stream. This depends on the design of the mapping function.

<hr/> <code>\seq_set_map:NNn</code>	<code>\seq_set_map:NNn <math>\langle seq\ var_1 \rangle</math> <math>\langle seq\ var_2 \rangle</math> {&lt;inline function&gt;}</code>
<hr/> <code>\seq_gset_map:NNn</code>	Applies $\langle inline\ function \rangle$ to every $\langle item \rangle$ stored within the $\langle seq\ var_2 \rangle$ . The $\langle inline\ function \rangle$ should consist of code which will receive the $\langle item \rangle$ as #1. The sequence resulting from applying $\langle inline\ function \rangle$ to each $\langle item \rangle$ is assigned to $\langle seq\ var_1 \rangle$ .
<hr/> New: 2011-12-22	
<hr/> Updated: 2020-07-16	

**T<sub>E</sub>Xhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level T<sub>E</sub>X errors.

---

<code>\seq_set_map_e:NNn</code>	<code>\seq_set_map_e:NNn &lt;seq var<sub>1</sub>&gt; &lt;seq var<sub>2</sub>&gt; {(inline function)}</code>
<code>\seq_gset_map_e:NNn</code>	Applies <i>&lt;inline function&gt;</i> to every <i>&lt;item&gt;</i> stored within the <i>&lt;seq var<sub>2</sub>&gt;</i> . The <i>&lt;inline function&gt;</i> should consist of code which will receive the <i>&lt;item&gt;</i> as #1. The sequence resulting from e-expanding <i>&lt;inline function&gt;</i> applied to each <i>&lt;item&gt;</i> is assigned to <i>&lt;seq var<sub>1</sub>&gt;</i> . As such, the code in <i>&lt;inline function&gt;</i> should be expandable.
New: 2020-07-16	
Updated: 2023-10-26	

---

**T<sub>E</sub>Xhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level T<sub>E</sub>X errors.

---

<code>\seq_count:N *</code>	<code>\seq_count:N &lt;seq var&gt;</code>
<code>\seq_count:c *</code>	Leaves the number of items in the <i>&lt;seq var&gt;</i> in the input stream as an <i>&lt;integer denotation&gt;</i> . The total number of items in a <i>&lt;seq var&gt;</i> includes those which are empty and duplicates, i.e., every item in a <i>&lt;seq var&gt;</i> is unique.
New: 2012-07-13	

---

## 20.8 Using the content of sequences directly

---

<code>\seq_use:Nnnn *</code>	<code>\seq_use:Nnnn &lt;seq var&gt; {(separator between two)}</code>
<code>\seq_use:cnnn *</code>	<code>{(separator between more than two)} {(separator between final two)}</code>
New: 2013-05-26	Places the contents of the <i>&lt;seq var&gt;</i> in the input stream, with the appropriate <i>&lt;separator&gt;</i> between the items. Namely, if the sequence has more than two items, the <i>&lt;separator between more than two&gt;</i> is placed between each pair of items except the last, for which the <i>&lt;separator between final two&gt;</i> is used. If the sequence has exactly two items, then they are placed in the input stream separated by the <i>&lt;separator between two&gt;</i> . If the sequence has a single item, it is placed in the input stream, and an empty sequence produces no output. An error is raised if the variable does not exist or if it is invalid.

---

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f }
\seq_use:Nnnn \l_tmpa_seq { ~and~ } { ,~ } { ,~and~ }
```

inserts “a, b, c, de, and f” in the input stream. The first separator argument is not used in this case because the sequence has more than 2 items.

**T<sub>E</sub>Xhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *<items>* do not expand further when appearing in an e-type or x-type argument expansion.

<hr/> <code>\seq_use:Nn</code> *	<code>\seq_use:Nn &lt;seq var&gt; {&lt;separator&gt;}</code>
<code>\seq_use:cn</code> *	Places the contents of the <code>&lt;seq var&gt;</code> in the input stream, with the <code>&lt;separator&gt;</code> between the items. If the sequence has a single item, it is placed in the input stream with no <code>&lt;separator&gt;</code> , and an empty sequence produces no output. An error is raised if the variable does not exist or if it is invalid.
<hr/> New: 2013-05-26	

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f }
\seq_use:Nn \l_tmpa_seq { ~and~ }
```

inserts “a and b and c and de and f” in the input stream.

**T<sub>E</sub>Xhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<items>` do not expand further when appearing in an `e`-type or `x`-type argument expansion.

## 20.9 Sequences as stacks

Sequences can be used as stacks, where data is pushed to and popped from the top of the sequence. (The left of a sequence is the top, for performance reasons.) The stack functions for sequences are not intended to be mixed with the general ordered data functions detailed in the previous section: a sequence should either be used as an ordered data type or as a stack, but not in both ways.

<hr/> <code>\seq_get:NN</code>	<code>\seq_get:NN &lt;seq var&gt; &lt;t1 var&gt;</code>
<code>\seq_get:cn</code>	Reads the top item from a <code>&lt;seq var&gt;</code> into the <code>&lt;t1 var&gt;</code> without removing it from the <code>&lt;seq var&gt;</code> . The <code>&lt;t1 var&gt;</code> is assigned locally. If <code>&lt;seq var&gt;</code> is empty the <code>&lt;t1 var&gt;</code> is set to the special marker <code>\q_no_value</code> .
<hr/> Updated: 2012-05-14	

<hr/> <code>\seq_pop:NN</code>	<code>\seq_pop:NN &lt;seq var&gt; &lt;t1 var&gt;</code>
<code>\seq_pop:cn</code>	Pops the top item from a <code>&lt;seq var&gt;</code> into the <code>&lt;t1 var&gt;</code> . Both of the variables are assigned locally. If <code>&lt;seq var&gt;</code> is empty the <code>&lt;t1 var&gt;</code> is set to the special marker <code>\q_no_value</code> .
<hr/> Updated: 2012-05-14	

<hr/> <code>\seq_gpop:NN</code>	<code>\seq_gpop:NN &lt;seq var&gt; &lt;t1 var&gt;</code>
<code>\seq_gpop:cn</code>	Pops the top item from a <code>&lt;seq var&gt;</code> into the <code>&lt;t1 var&gt;</code> . The <code>&lt;seq var&gt;</code> is modified globally, while the <code>&lt;t1 var&gt;</code> is assigned locally. If <code>&lt;seq var&gt;</code> is empty the <code>&lt;t1 var&gt;</code> is set to the special marker <code>\q_no_value</code> .
<hr/> Updated: 2012-05-14	

<hr/> <code>\seq_get:NNTF</code>	<code>\seq_get:NNTF &lt;seq var&gt; &lt;t1 var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\seq_get:cNTF</code>	If the <code>&lt;seq var&gt;</code> is empty, leaves the <code>&lt;false code&gt;</code> in the input stream. The value of the <code>&lt;t1 var&gt;</code> is not defined in this case and should not be relied upon. If the <code>&lt;seq var&gt;</code> is non-empty, stores the top item from a <code>&lt;seq var&gt;</code> in the <code>&lt;t1 var&gt;</code> without removing it from the <code>&lt;seq var&gt;</code> . The <code>&lt;t1 var&gt;</code> is assigned locally.

## 20.10 Sequences as sets

Sequences can also be used as sets, such that all of their items are distinct. Usage of sequences as sets is not currently widespread, hence no specific set function is provided. Instead, it is explained here how common set operations can be performed by combining several functions described in earlier sections. When using sequences to implement sets, one should be careful not to rely on the order of items in the sequence representing the set.

Sets should not contain several occurrences of a given item. To make sure that a `<seq var>` only has distinct items, use `\seq_remove_duplicates:N <seq var>`. This function is relatively slow, and to avoid performance issues one should only use it when necessary.

Some operations on a set `<seq var>` are straightforward. For instance, `\seq_count:N <seq var>` expands to the number of items, while `\seq_if_in:NnTF <seq var> {<item>}` tests if the `<item>` is in the set.

Adding an `<item>` to a set `<seq var>` can be done by appending it to the `<seq var>` if it is not already in the `<seq var>`:

```
\seq_if_in:NnF <seq var> {<item>}
{ \seq_put_right:Nn <seq var> {<item>} }
```

Removing an `<item>` from a set `<seq var>` can be done using `\seq_remove_all:Nn`,

```
\seq_remove_all:Nn <seq var> {<item>}
```

The intersection of two sets `<seq var1>` and `<seq var2>` can be stored into `<seq var3>` by collecting items of `<seq var1>` which are in `<seq var2>`.

```

\seq_clear:N <seq var3>
\seq_map_inline:Nn <seq var1>
{
  \seq_if_in:NnT <seq var2> {#1}
  { \seq_put_right:Nn <seq var3> {#1} }
}

```

The code as written here only works if  $\langle \text{seq var}_3 \rangle$  is different from the other two sequence variables. To cover all cases, items should first be collected in a sequence  $\backslash l\_ \langle \text{pkg} \rangle\_ \text{tmp\_seq}$ , then  $\langle \text{seq var}_3 \rangle$  should be set equal to this internal sequence. The same remark applies to other set functions.

The union of two sets  $\langle \text{seq var}_1 \rangle$  and  $\langle \text{seq var}_2 \rangle$  can be stored into  $\langle \text{seq var}_3 \rangle$  through

```

\seq_concat:NNN <seq var3> <seq var1> <seq var2>
\seq_remove_duplicates:N <seq var3>

```

or by adding items to (a copy of)  $\langle \text{seq var}_1 \rangle$  one by one

```

\seq_set_eq:NN <seq var3> <seq var1>
\seq_map_inline:Nn <seq var2>
{
  \seq_if_in:NnF <seq var3> {#1}
  { \seq_put_right:Nn <seq var3> {#1} }
}

```

The second approach is faster than the first when the  $\langle \text{seq var}_2 \rangle$  is short compared to  $\langle \text{seq var}_1 \rangle$ .

The difference of two sets  $\langle \text{seq var}_1 \rangle$  and  $\langle \text{seq var}_2 \rangle$  can be stored into  $\langle \text{seq var}_3 \rangle$  by removing items of the  $\langle \text{seq var}_2 \rangle$  from (a copy of) the  $\langle \text{seq var}_1 \rangle$  one by one.

```

\seq_set_eq:NN <seq var3> <seq var1>
\seq_map_inline:Nn <seq var2>
{ \seq_remove_all:Nn <seq var3> {#1} }

```

The symmetric difference of two sets  $\langle \text{seq var}_1 \rangle$  and  $\langle \text{seq var}_2 \rangle$  can be stored into  $\langle \text{seq var}_3 \rangle$  by computing the difference between  $\langle \text{seq var}_1 \rangle$  and  $\langle \text{seq var}_2 \rangle$  and storing the result as  $\backslash l\_ \langle \text{pkg} \rangle\_ \text{tmp\_seq}$ , then the difference between  $\langle \text{seq var}_2 \rangle$  and  $\langle \text{seq var}_1 \rangle$ , and finally concatenating the two differences to get the symmetric differences.

```

\seq_set_eq:NN \l\_ \langle \text{pkg} \rangle\_ \text{tmp\_seq} <seq var1>
\seq_map_inline:Nn <seq var2>
{ \seq_remove_all:Nn \l\_ \langle \text{pkg} \rangle\_ \text{tmp\_seq} {#1} }
\seq_set_eq:NN <seq var3> <seq var2>
\seq_map_inline:Nn <seq var1>
{ \seq_remove_all:Nn <seq var3> {#1} }
\seq_concat:NNN <seq var3> <seq var3> \l\_ \langle \text{pkg} \rangle\_ \text{tmp\_seq}

```

## 20.11 Constant and scratch sequences

---

$\backslash \text{c\_empty\_seq}$  Constant that is always empty.

---

New: 2012-07-02

---

---

<code>\l_tmpa_seq</code>	Scratch sequences for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_seq</code>	

---

New: 2012-04-26

---

---

<code>\g_tmpa_seq</code>	Scratch sequences for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_seq</code>	

---

New: 2012-04-26

---

## 20.12 Viewing sequences

---

<code>\seq_show:N</code>	<code>\seq_show:N &lt;seq var&gt;</code>
<code>\seq_show:c</code>	Displays the entries in the <code>&lt;seq var&gt;</code> in the terminal.

---

Updated: 2021-04-29

---

---

<code>\seq_log:N</code>	<code>\seq_log:N &lt;seq var&gt;</code>
<code>\seq_log:c</code>	Writes the entries in the <code>&lt;seq var&gt;</code> in the log file.

## Chapter 21

# The l3int module

## Integers

Calculation and comparison of integer values can be carried out using literal numbers, `int` registers, constants and integers stored in token list variables. The standard operators `+`, `-`, `/` and `*` and parentheses can be used within such expressions to carry arithmetic operations. This module carries out these functions on *integer expressions* (“`<int expr>`”).

### 21.1 Integer expressions

Throughout this module, (almost) all `n`-type argument allow for an `<intexpr>` argument with the following syntax. The `<integer expression>` should consist, after expansion, of `+`, `-`, `*`, `/`, `(`, `)` and of course integer operands. The result is calculated by applying standard mathematical rules with the following peculiarities:

- `/` denotes division rounded to the closest integer with ties rounded away from zero;
- there is an error and the overall expression evaluates to zero whenever the absolute value of any intermediate result exceeds  $2^{31} - 1$ , except in the case of scaling operations  $a*b/c$ , for which  $a*b$  may be arbitrarily large (but the operands  $a$ ,  $b$ ,  $c$  are still constrained to an absolute value at most  $2^{31} - 1$ );
- parentheses may not appear after unary `+` or `-`, namely placing `+(` or `-(` at the start of an expression or after `+`, `-`, `*`, `/` or `(` leads to an error.

Each integer operand can be either an integer variable (with no need for `\int_use:N`) or an integer denotation. For example both

```
\int_show:n { 5 + 4 * 3 - ( 3 + 4 * 5 ) }
```

and

```
\tl_new:N \l_my_tl  
\tl_set:Nn \l_my_tl { 5 }  
\int_new:N \l_my_int  
\int_set:Nn \l_my_int { 4 }  
\int_show:n { \l_my_tl + \l_my_int * 3 - ( 3 + 4 * 5 ) }
```

show the same result  $-6$  because `\l_my_tl` expands to the integer denotation 5 while the integer variable `\l_my_int` takes the value 4. As the *integer expression* is fully expanded from left to right during evaluation, fully expandable and restricted-expandable functions can both be used, and `\exp_not:n` and its variants have no effect while `\exp_not:N` may incorrectly interrupt the expression.

---

`\int_eval:n` ★ `\int_eval:n {(int expr)}`

---

Evaluates the *int expr* and leaves the result in the input stream as an integer denotation: for positive results an explicit sequence of decimal digits not starting with 0, for negative results  $-$  followed by such a sequence, and 0 for zero.

**T<sub>E</sub>Xhackers note:** Exactly two expansions are needed to evaluate `\int_eval:n`. The result is *not* an *internal integer*, and therefore requires suitable termination if used in a T<sub>E</sub>X-style integer assignment.

As all T<sub>E</sub>X integers, integer operands can also be dimension or skip variables, converted to integers in **sp**, or octal numbers given as `'` followed by digits other than 8 and 9, or hexadecimal numbers given as `"` followed by digits or upper case letters from **A** to **F**, or the character code of some character or one-character control sequence, given as `'char`.

---

`\int_eval:w` ★ `\int_eval:w (int expr)`

---

New: 2018-03-30

Evaluates the *int expr* as described for `\int_eval:n`. The end of the expression is the first token encountered that cannot form part of such an expression. If that token is `\scan_stop`: it is removed, otherwise not. Spaces do *not* terminate the expression. However, spaces terminate explicit integers, and this may terminate the expression: for instance, `\int_eval:w 1_+1_9` (with explicit space tokens inserted using `~` in a code setting) expands to 29 since the digit 9 is not part of the expression. Expansion details, etc., are as given for `\int_eval:n`.

---

`\int_sign:n` ★ `\int_sign:n {(int expr)}`

---

New: 2018-11-03

Evaluates the *int expr* then leaves 1 or 0 or  $-1$  in the input stream according to the sign of the result.

---

`\int_abs:n` ★ `\int_abs:n {(int expr)}`

---

Updated: 2012-09-26

Evaluates the *int expr* as described for `\int_eval:n` and leaves the absolute value of the result in the input stream as an *integer denotation* after two expansions.

---

`\int_div_round:nn` ★ `\int_div_round:nn {(int expr1)} {(int expr2)}`

---

Updated: 2012-09-26

Evaluates the two *int expr*s as described earlier, then divides the first value by the second, and rounds the result to the closest integer. Ties are rounded away from zero. Note that this is identical to using `/` directly in an *int expr*. The result is left in the input stream as an *integer denotation* after two expansions.

---

`\int_div_truncate:nn` ★ `\int_div_truncate:nn {(int expr1)} {(int expr2)}`

---

Updated: 2012-02-09

Evaluates the two *int expr*s as described earlier, then divides the first value by the second, and rounds the result towards zero. Note that division using `/` rounds to the closest integer instead. The result is left in the input stream as an *integer denotation* after two expansions.

---

<code>\int_max:nn</code>	<code>★ \int_max:nn {\int expr_1} {\int expr_2}</code>
<code>\int_min:nn</code>	<code>★ \int_min:nn {\int expr_1} {\int expr_2}</code>
Updated: 2012-09-26	Evaluates the $\langle \text{int expr} \rangle$ s as described for <code>\int_eval:n</code> and leaves either the larger or smaller value in the input stream as an $\langle \text{integer denotation} \rangle$ after two expansions.

---

---

<code>\int_mod:nn</code>	<code>★ \int_mod:nn {\int expr_1} {\int expr_2}</code>
Updated: 2012-09-26	Evaluates the two $\langle \text{int expr} \rangle$ s as described earlier, then calculates the integer remainder of dividing the first expression by the second. This is obtained by subtracting <code>\int_div-truncate:nn</code> $\{\langle \text{int expr}_1 \rangle\} \{\langle \text{int expr}_2 \rangle\}$ times $\langle \text{int expr}_2 \rangle$ from $\langle \text{int expr}_1 \rangle$ . Thus, the result has the same sign as $\langle \text{int expr}_1 \rangle$ and its absolute value is strictly less than that of $\langle \text{int expr}_2 \rangle$ . The result is left in the input stream as an $\langle \text{integer denotation} \rangle$ after two expansions.

---

## 21.2 Creating and initialising integers

---

<code>\int_new:N</code>	<code>\int_new:N \langle integer \rangle</code>
<code>\int_new:c</code>	Creates a new $\langle \text{integer} \rangle$ or raises an error if the name is already taken. The declaration is global. The $\langle \text{integer} \rangle$ is initially equal to 0.

---

---

<code>\int_const:Nn</code>	<code>\int_const:Nn \langle integer \rangle {\int expr}</code>
<code>\int_const:cn</code>	Creates a new constant $\langle \text{integer} \rangle$ or raises an error if the name is already taken. The value of the $\langle \text{integer} \rangle$ is set globally to the $\langle \text{int expr} \rangle$ .
Updated: 2011-10-22	

---

---

<code>\int_zero:N</code>	<code>\int_zero:N \langle integer \rangle</code>
<code>\int_zero:c</code>	
<code>\int_gzero:N</code>	Sets $\langle \text{integer} \rangle$ to 0.
<code>\int_gzero:c</code>	

---

---

<code>\int_zero_new:N</code>	<code>\int_zero_new:N \langle integer \rangle</code>
<code>\int_zero_new:c</code>	
<code>\int_gzero_new:N</code>	Ensures that the $\langle \text{integer} \rangle$ exists globally by applying <code>\int_new:N</code> if necessary, then applies <code>\int_(g)zero:N</code> to leave the $\langle \text{integer} \rangle$ set to zero.
<code>\int_gzero_new:c</code>	

---

New: 2011-12-13

---

---

<code>\int_set_eq:NN</code>	<code>\int_set_eq:NN \langle integer_1 \rangle \langle integer_2 \rangle</code>
<code>\int_set_eq:(cN Nc cc)</code>	
<code>\int_gset_eq:NN</code>	Sets the content of $\langle \text{integer}_1 \rangle$ equal to that of $\langle \text{integer}_2 \rangle$ .
<code>\int_gset_eq:(cN Nc cc)</code>	

---

---

<code>\int_if_exist_p:N</code>	<code>★ \int_if_exist_p:N \langle integer \rangle</code>
<code>\int_if_exist_p:c</code>	<code>★ \int_if_exist:N\TF \langle integer \rangle {\langle true code \rangle} {\langle false code \rangle}</code>
<code>\int_if_exist:N\TF</code>	<code>★</code>
<code>\int_if_exist:c\TF</code>	<code>★</code>
	Tests whether the $\langle \text{integer} \rangle$ is currently defined. This does not check that the $\langle \text{integer} \rangle$ really is an integer variable.

---

New: 2012-03-03

---

## 21.3 Setting and incrementing integers

---

<code>\int_add:Nn</code>	<code>\int_add:Nn &lt;integer&gt; {&lt;int expr&gt;}</code>
<code>\int_add:cn</code>	
<code>\int_gadd:Nn</code>	Adds the result of the <code>&lt;int expr&gt;</code> to the current content of the <code>&lt;integer&gt;</code> .
<code>\int_gadd:cn</code>	

---

Updated: 2011-10-22

---

---

<code>\int_decr:N</code>	<code>\int_decr:N &lt;integer&gt;</code>
<code>\int_decr:c</code>	
<code>\int_gdecr:N</code>	Decreases the value stored in <code>&lt;integer&gt;</code> by 1.
<code>\int_gdecr:c</code>	

---

---

<code>\int_incr:N</code>	<code>\int_incr:N &lt;integer&gt;</code>
<code>\int_incr:c</code>	
<code>\int_gincr:N</code>	Increases the value stored in <code>&lt;integer&gt;</code> by 1.
<code>\int_gincr:c</code>	

---

---

<code>\int_set:Nn</code>	<code>\int_set:Nn &lt;integer&gt; {&lt;int expr&gt;}</code>
<code>\int_set:(cn NV cV)</code>	
<code>\int_gset:Nn</code>	Sets <code>&lt;integer&gt;</code> to the value of <code>&lt;int expr&gt;</code> , which must evaluate to an integer (as described for <code>\int_eval:n</code> ).
<code>\int_gset:(cn NV cV)</code>	

---

Updated: 2011-10-22

---

---

<code>\int_set_regex_count:Nnn</code>	<code>\int_set_regex_count:Nnn &lt;integer&gt; {&lt;regex&gt;} {&lt;token list&gt;}</code>
<code>\int_set_regex_count:cnn</code>	<code>\int_set_regex_count:Nnn &lt;integer&gt; &lt;regex var&gt; {&lt;token list&gt;}</code>
<code>\int_set_regex_count:NNn</code>	
<code>\int_set_regex_count:cNn</code>	Sets <code>&lt;integer&gt;</code> equal to the number of times <code>&lt;regular expression&gt;</code> appears in <code>&lt;token list&gt;</code> . The search starts by finding the left-most longest match, respecting greedy and lazy (non-greedy) operators. Then the search starts again from the character following the last character of the previous match, until reaching the end of the token list. Infinite loops are prevented in the case where the regular expression can match an empty token list: then we count one match between each pair of characters. For instance,
<code>\int_gset_regex_count:Nnn</code>	
<code>\int_gset_regex_count:cnn</code>	
<code>\int_gset_regex_count:NNn</code>	
<code>\int_gset_regex_count:cNn</code>	

---

New: 2024-12-08

---

`\int_set_regex_count:Nnn \l_foo_int { (b+|c) } { abbababcbb }`

results in `\l_foo_int` taking the value 5. Theses are alternative names for `\regex_count:nnN` and friends, with arguments re-ordered for `<integer>` setting; see `l3regex` chapter for more details of the `<regex>` format.

---

<code>\int_sub:Nn</code>	<code>\int_sub:Nn &lt;integer&gt; {&lt;int expr&gt;}</code>
<code>\int_sub:cn</code>	
<code>\int_gsub:Nn</code>	Subtracts the result of the <code>&lt;int expr&gt;</code> from the current content of the <code>&lt;integer&gt;</code> .
<code>\int_gsub:cn</code>	

---

Updated: 2011-10-22

---

## 21.4 Using integers

---

<code>\int_use:N</code>	★	<code>\int_use:N</code> $\langle integer \rangle$
<code>\int_use:c</code>	★	Recovers the content of an $\langle integer \rangle$ and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where an $\langle integer \rangle$ is required (such as in the first and third arguments of <code>\int_compare:nNnTF</code> ).

---

Updated: 2011-10-22

**TeXhackers note:** `\int_use:N` is the TeX primitive `\the`: this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 21.5 Integer expression conditionals

---

<code>\int_compare_p:nNn</code>	★	<code>\int_compare_p:nNn</code> $\{\langle int\ expr_1 \rangle\}$ $\langle relation \rangle$ $\{\langle int\ expr_2 \rangle\}$
<code>\int_compare:nNnTF</code>	★	<code>\int_compare:nNnTF</code> $\{\langle int\ expr_1 \rangle\}$ $\langle relation \rangle$ $\{\langle int\ expr_2 \rangle\}$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$

---

This function first evaluates each of the  $\langle int\ expr \rangle$ s as described for `\int_eval:n`. The two results are then compared using the  $\langle relation \rangle$ :

Equal	=
Greater than	>
Less than	<

This function is less flexible than `\int_compare:nTF` but around 5 times faster.

Updated: 2013-01-13

This function evaluates the  $\langle \text{int expr} \rangle$ s as described for `\int_eval:n` and compares consecutive result using the corresponding  $\langle \text{relation} \rangle$ , namely it compares  $\langle \text{int expr}_1 \rangle$  and  $\langle \text{int expr}_2 \rangle$  using the  $\langle \text{relation}_1 \rangle$ , then  $\langle \text{int expr}_2 \rangle$  and  $\langle \text{int expr}_3 \rangle$  using the  $\langle \text{relation}_2 \rangle$ , until finally comparing  $\langle \text{int expr}_N \rangle$  and  $\langle \text{int expr}_{N+1} \rangle$  using the  $\langle \text{relation}_N \rangle$ . The test yields `true` if all comparisons are `true`. Each  $\langle \text{int expr} \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is `false`, then no other  $\langle \text{integer expression} \rangle$  is evaluated and no other comparison is performed. The  $\langle \text{relations} \rangle$  can be any of the following:

Equal	= or ==
Greater than or equal to	>=
Greater than	>
Less than or equal to	<=
Less than	<
Not equal	!=

This function is more flexible than `\int_compare:nNnTF` but around 5 times slower.

---

<code>\int_case:nn</code> $\star$ <code>\int_case:nnTF</code> $\{ \langle \text{test int expr} \rangle \}$ <code>\int_case:nnTF</code> $\star$ $\{$ <div style="text-align: center; margin: 5px 0;"><small>New: 2013-07-24</small></div>	$\{ \langle \text{int expr case}_1 \rangle \} \{ \langle \text{code case}_1 \rangle \}$ $\{ \langle \text{int expr case}_2 \rangle \} \{ \langle \text{code case}_2 \rangle \}$ $\dots$ $\{ \langle \text{int expr case}_n \rangle \} \{ \langle \text{code case}_n \rangle \}$ $\}$ $\{ \langle \text{true code} \rangle \}$ $\{ \langle \text{false code} \rangle \}$
--	---

---

This function evaluates the  $\langle \text{test int expr} \rangle$  and compares this in turn to each of the  $\langle \text{int expr case} \rangle$ s until a match is found. If the two are equal then the associated  $\langle \text{code} \rangle$  is left in the input stream and other cases are discarded. If any of the cases are matched, the  $\langle \text{true code} \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle \text{false code} \rangle$  is inserted. The function `\int_case:nn`, which does nothing if there is no match, is also available. For example

```

\int_case:nnF
{ 2 * 5 }
{
  { 5 }      { Small }
  { 4 + 6 }  { Medium }
  { -2 * 10 } { Negative }
}
{ No idea! }

```

leaves “Medium” in the input stream. Since evaluation of the test expressions stops at the first successful case, the order of possible matches should normally be that the most likely are earlier: this will reduce the average steps required to complete expansion.

---

<code>\int_if_even_p:n</code> $\star$ <code>\int_if_odd_p:n</code> $\{ \langle \text{int expr} \rangle \}$ <code>\int_if_even:nTF</code> $\star$ <code>\int_if_odd:nTF</code> $\{ \langle \text{int expr} \rangle \}$ <code>\int_if_odd_p:n</code> $\star$ $\{ \langle \text{true code} \rangle \} \{ \langle \text{false code} \rangle \}$ <code>\int_if_odd:nTF</code> $\star$	This function first evaluates the $\langle \text{int expr} \rangle$ as described for <code>\int_eval:n</code> . It then evaluates if this is odd or even, as appropriate.
---	---

---

---

<code>\int_if_zero_p:n</code> $\star$ <code>\int_if_zero_p:n</code> $\{ \langle \text{int expr} \rangle \}$ <code>\int_if_zero:nTF</code> $\star$ <code>\int_if_zero:nTF</code> $\{ \langle \text{int expr} \rangle \}$ <div style="text-align: center; margin: 5px 0;"><small>New: 2023-05-17</small></div>	$\{ \langle \text{true code} \rangle \} \{ \langle \text{false code} \rangle \}$
--	--

---

This function first evaluates the  $\langle \text{int expr} \rangle$  as described for `\int_eval:n`. It then evaluates if this is zero or not.

## 21.6 Integer expression loops

---

<code>\int_do_until:nNnn</code> $\star$	<code>\int_do_until:nNnn</code> $\{ \langle \text{int expr}_1 \rangle \} \langle \text{relation} \rangle \{ \langle \text{int expr}_2 \rangle \} \{ \langle \text{code} \rangle \}$
---	---

---

Places the  $\langle \text{code} \rangle$  in the input stream for T<sub>E</sub>X to process, and then evaluates the relationship between the two  $\langle \text{int expr} \rangle$ s as described for `\int_compare:nNnTF`. If the test is **false** then the  $\langle \text{code} \rangle$  is inserted into the input stream again and a loop occurs until the  $\langle \text{relation} \rangle$  is **true**.

<hr/> <code>\int_do_while:nNnn</code> ☆	<code>\int_do_while:nNnn {&lt;int expr<sub>1</sub>&gt;} &lt;relation&gt; {&lt;int expr<sub>2</sub>&gt;} {&lt;code&gt;}</code>
	Places the <code>&lt;code&gt;</code> in the input stream for T <sub>E</sub> X to process, and then evaluates the relationship between the two <code>&lt;int expr&gt;</code> s as described for <code>\int_compare:nNnTF</code> . If the test is <code>true</code> then the <code>&lt;code&gt;</code> is inserted into the input stream again and a loop occurs until the <code>&lt;relation&gt;</code> is <code>false</code> .
<hr/> <code>\int_until_do:nNnn</code> ☆	<code>\int_until_do:nNnn {&lt;int expr<sub>1</sub>&gt;} &lt;relation&gt; {&lt;int expr<sub>2</sub>&gt;} {&lt;code&gt;}</code>
	Evaluates the relationship between the two <code>&lt;int expr&gt;</code> s as described for <code>\int_compare:nNnTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is <code>false</code> . After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is <code>true</code> .
<hr/> <code>\int_while_do:nNnn</code> ☆	<code>\int_while_do:nNnn {&lt;int expr<sub>1</sub>&gt;} &lt;relation&gt; {&lt;int expr<sub>2</sub>&gt;} {&lt;code&gt;}</code>
	Evaluates the relationship between the two <code>&lt;int expr&gt;</code> s as described for <code>\int_compare:nNnTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is <code>true</code> . After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is <code>false</code> .
<hr/> <code>\int_do_until:nn</code> ☆	<code>\int_do_until:nn {&lt;integer relation&gt;} {&lt;code&gt;}</code>
Updated: 2013-01-13	Places the <code>&lt;code&gt;</code> in the input stream for T <sub>E</sub> X to process, and then evaluates the <code>&lt;integer relation&gt;</code> as described for <code>\int_compare:nTF</code> . If the test is <code>false</code> then the <code>&lt;code&gt;</code> is inserted into the input stream again and a loop occurs until the <code>&lt;relation&gt;</code> is <code>true</code> .

After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is <code>false</code> .

## 21.7 Integer step functions

---

<code>\int_step_function:nN</code>	☆	<code>\int_step_function:nN {⟨final value⟩} ⟨function⟩</code>
<code>\int_step_function:nnN</code>	☆	<code>\int_step_function:nnN {⟨initial value⟩} {⟨final value⟩} ⟨function⟩</code>
<code>\int_step_function:nnnN</code>	☆	<code>\int_step_function:nnnN {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} ⟨function⟩</code>

---

New: 2012-06-04  
Updated: 2018-04-22

This function first evaluates the `⟨initial value⟩`, `⟨step⟩` and `⟨final value⟩`, all of which should be integer expressions. The `⟨function⟩` is then placed in front of each `⟨value⟩` from the `⟨initial value⟩` to the `⟨final value⟩` in turn (using `⟨step⟩` between each `⟨value⟩`). The `⟨step⟩` must be non-zero. If the `⟨step⟩` is positive, the loop stops when the `⟨value⟩` becomes larger than the `⟨final value⟩`. If the `⟨step⟩` is negative, the loop stops when the `⟨value⟩` becomes smaller than the `⟨final value⟩`. The `⟨function⟩` should absorb one numerical argument. For example

```
\cs_set:Npn \my_func:n #1 { [I~saw~#1] \quad }
\int_step_function:nnnN { 1 } { 1 } { 5 } \my_func:n
```

would print

```
[I saw 1] [I saw 2] [I saw 3] [I saw 4] [I saw 5]
```

The functions `\int_step_function:nN` and `\int_step_function:nnN` both use a fixed `⟨step⟩` of 1, and in the case of `\int_step_function:nN` the `⟨initial value⟩` is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

---

<code>\int_step_tokens:nn</code>	☆	<code>\int_step_tokens:nn {⟨final value⟩} {⟨code⟩}</code>
<code>\int_step_tokens:nnn</code>	☆	<code>\int_step_tokens:nnn {⟨initial value⟩} {⟨final value⟩} {⟨code⟩}</code>
<code>\int_step_tokens:nnnn</code>	☆	<code>\int_step_tokens:nnnn {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} {⟨code⟩}</code>

---

New: 2025-01-13

This function works just like `\int_step_function:nnnN` but instead of mapping a single function to each stepped `⟨value⟩` between `⟨initial value⟩` and `⟨final value⟩` this maps the multiple tokens in `⟨code⟩`, so that it gets the current `⟨value⟩` as a braced argument following it. For instance

```
\cs_set:Npn \my_product:nn #1#2
{ $ #1 \times #2 = \int_eval:n { #1 * #2 }$ \quad }
\int_step_tokens:nnnn { 1 } { 1 } { 4 } { \my_product:nn { 2 } }
```

would print

```
2 × 1 = 2 2 × 2 = 4 2 × 3 = 6 2 × 4 = 8
```

---

<code>\int_step_inline:nn</code>	<code>\int_step_inline:nn {⟨final value⟩} {⟨code⟩}</code>
<code>\int_step_inline:nnn</code>	<code>\int_step_inline:nnn {⟨initial value⟩} {⟨final value⟩} {⟨code⟩}</code>
<code>\int_step_inline:nnnn</code>	<code>\int_step_inline:nnnn {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} {⟨code⟩}</code>

---

New: 2012-06-04  
Updated: 2018-04-22

This function first evaluates the `⟨initial value⟩`, `⟨step⟩` and `⟨final value⟩`, all of which should be integer expressions. Then for each `⟨value⟩` from the `⟨initial value⟩` to the `⟨final value⟩` in turn (using `⟨step⟩` between each `⟨value⟩`), the `⟨code⟩` is inserted into the input stream with `#1` replaced by the current `⟨value⟩`. Thus the `⟨code⟩` should define a function of one argument (`#1`).

The functions `\int_step_inline:nn` and `\int_step_inline:nnn` both use a fixed `⟨step⟩` of 1, and in the case of `\int_step_inline:nn` the `⟨initial value⟩` is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

---

<code>\int_step_variable:nNn</code>	<code>\int_step_variable:nNn {&lt;final value&gt;} &lt;tl var&gt; {&lt;code&gt;}</code>
<code>\int_step_variable:nnNn</code>	<code>\int_step_variable:nnNn {&lt;initial value&gt;} {&lt;final value&gt;} &lt;tl var&gt; {&lt;code&gt;}</code>
<code>\int_step_variable:nnnNn</code>	<code>\int_step_variable:nnnNn {&lt;initial value&gt;} {&lt;step&gt;} {&lt;final value&gt;} &lt;tl var&gt; {&lt;code&gt;}</code>

---

New: 2012-06-04

Updated: 2018-04-22

This function first evaluates the `<initial value>`, `<step>` and `<final value>`, all of which should be integer expressions. Then for each `<value>` from the `<initial value>` to the `<final value>` in turn (using `<step>` between each `<value>`), the `<code>` is inserted into the input stream, with the `<tl var>` defined as the current `<value>`. Thus the `<code>` should make use of the `<tl var>`.

The functions `\int_step_variable:nNn` and `\int_step_variable:nnNn` both use a fixed `<step>` of 1, and in the case of `\int_step_variable:nNn` the `<initial value>` is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

## 21.8 Formatting integers

Integers can be placed into the output stream with formatting. These conversions apply to any integer expressions.

---

<code>\int_to_arabic:n *</code>	<code>\int_to_arabic:n {&lt;int expr&gt;}</code>
---------------------------------	--

---

<code>\int_to_arabic:v *</code>	
---------------------------------	--

Updated: 2011-10-22

Places the value of the `<int expr>` in the input stream as digits, with category code 12 (other).

---

<code>\int_to_alph:n *</code>	<code>\int_to_alph:n {&lt;int expr&gt;}</code>
-------------------------------	--

---

<code>\int_to_Alph:n *</code>	
-------------------------------	--

Updated: 2011-09-17

Evaluates the `<int expr>` and converts the result into a series of letters, which are then left in the input stream. The conversion rule uses the 26 letters of the English alphabet, in order, adding letters when necessary to increase the total possible range of representable numbers. Thus

`\int_to_alph:n { 1 }`

places `a` in the input stream,

`\int_to_alph:n { 26 }`

is represented as `z` and

`\int_to_alph:n { 27 }`

is converted to `aa`. For conversions using other alphabets, use `\int_to_symbols:nnn` to define an alphabet-specific function. The basic `\int_to_alph:n` and `\int_to_Alph:n` functions should not be modified. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

<hr/>	<hr/>
<code>\int_to_symbols:nnn</code> *	<code>\int_to_symbols:nnn</code>
<hr/>	<hr/>
Updated: 2011-09-17	<code>{⟨int expr⟩} {⟨total symbols⟩}</code> <code>{⟨value to symbol mapping⟩}</code>

This is the low-level function for conversion of an  $\langle int\ expr \rangle$  into a symbolic form (often letters). The  $\langle total\ symbols \rangle$  available should be given as an integer expression. Values are actually converted to symbols according to the  $\langle value\ to\ symbol\ mapping \rangle$ . This should be given as  $\langle total\ symbols \rangle$  pairs of entries, a number and the appropriate symbol. Thus the `\int_to_alph:n` function is defined as

```

\cs_new:Npn \int_to_alph:n #1
{
  \int_to_symbols:nnn {#1} { 26 }
  {
    { 1 } { a }
    { 2 } { b }
    ...
    { 26 } { z }
  }
}

```

---

<code>\int_to_bin:n</code> *	<code>\int_to_bin:n {⟨int expr⟩}</code>
------------------------------	---

---

New: 2014-02-11	Calculates the value of the $\langle int\ expr \rangle$ and places the binary representation of the result in the input stream.
-----------------	---

---

---

<code>\int_to_hex:n</code> *	<code>\int_to_hex:n {⟨int expr⟩}</code>
------------------------------	---

---

New: 2014-02-11	Calculates the value of the $\langle int\ expr \rangle$ and places the hexadecimal (base 16) representation of the result in the input stream. Letters are used for digits beyond 9: lower case letters for <code>\int_to_hex:n</code> and upper case ones for <code>\int_to_Hex:n</code> . The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).
-----------------	---

---

---

<code>\int_to_oct:n</code> *	<code>\int_to_oct:n {⟨int expr⟩}</code>
------------------------------	---

---

New: 2014-02-11	Calculates the value of the $\langle int\ expr \rangle$ and places the octal (base 8) representation of the result in the input stream. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).
-----------------	---

---

---

<code>\int_to_base:nn</code> *	<code>\int_to_base:nn {⟨int expr⟩} {⟨base⟩}</code>
--------------------------------	--

---

Updated: 2014-02-11	Calculates the value of the $\langle int\ expr \rangle$ and converts it into the appropriate representation in the $\langle base \rangle$ ; the later may be given as an integer expression. For bases greater than 10 the higher “digits” are represented by letters from the English alphabet: lower case letters for <code>\int_to_base:n</code> and upper case ones for <code>\int_to_Base:n</code> . The maximum $\langle base \rangle$ value is 36. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).
---------------------	---

---

**TeXhackers note:** This is a generic version of `\int_to_bin:n`, etc.

<hr/>	
<code>\int_to_roman:n</code> ☆	<code>\int_to_roman:n {⟨int expr⟩}</code>
<code>\int_to_Roman:n</code> ☆	Places the value of the <code>⟨int expr⟩</code> in the input stream as Roman numerals, either lower case ( <code>\int_to_roman:n</code> ) or upper case ( <code>\int_to_Roman:n</code> ). If the value is negative or zero, the output is empty. The Roman numerals are letters with category code 11 (letter). The letters used are <code>mdclxvi</code> , repeated as needed: the notation with bars (such as $\bar{v}$ for 5000) is <i>not</i> used. For instance <code>\int_to_roman:n { 8249 }</code> expands to <code>mmmmmmmmccxlix</code> .
Updated: 2011-10-22	

## 21.9 Converting from other formats to integers

<hr/>	
<code>\int_from_alph:n</code> ★	<code>\int_from_alph:n {⟨letters⟩}</code>
Updated: 2014-08-25	Converts the <code>⟨letters⟩</code> into the integer (base 10) representation and leaves this in the input stream. The <code>⟨letters⟩</code> are first converted to a string, with no expansion. Lower and upper case letters from the English alphabet may be used, with “a” equal to 1 through to “z” equal to 26. The function also accepts a leading sign, made of + and -. This is the inverse function of <code>\int_to_alph:n</code> and <code>\int_to_Alph:n</code> .
<hr/>	
<code>\int_from_bin:n</code> ★	<code>\int_from_bin:n {⟨binary number⟩}</code>
New: 2014-02-11 Updated: 2014-08-25	Converts the <code>⟨binary number⟩</code> into the integer (base 10) representation and leaves this in the input stream. The <code>⟨binary number⟩</code> is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by binary digits. This is the inverse function of <code>\int_to_bin:n</code> .
<hr/>	
<code>\int_from_hex:n</code> ★	<code>\int_from_hex:n {⟨hexadecimal number⟩}</code>
New: 2014-02-11 Updated: 2014-08-25	Converts the <code>⟨hexadecimal number⟩</code> into the integer (base 10) representation and leaves this in the input stream. Digits greater than 9 may be represented in the <code>⟨hexadecimal number⟩</code> by upper or lower case letters. The <code>⟨hexadecimal number⟩</code> is first converted to a string, with no expansion. The function also accepts a leading sign, made of + and -. This is the inverse function of <code>\int_to_hex:n</code> and <code>\int_to_Hex:n</code> .
<hr/>	
<code>\int_from_oct:n</code> ★	<code>\int_from_oct:n {⟨octal number⟩}</code>
New: 2014-02-11 Updated: 2014-08-25	Converts the <code>⟨octal number⟩</code> into the integer (base 10) representation and leaves this in the input stream. The <code>⟨octal number⟩</code> is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by octal digits. This is the inverse function of <code>\int_to_oct:n</code> .
<hr/>	
<code>\int_from_roman:n</code> ★	<code>\int_from_roman:n {⟨roman numeral⟩}</code>
Updated: 2014-08-25	Converts the <code>⟨roman numeral⟩</code> into the integer (base 10) representation and leaves this in the input stream. The <code>⟨roman numeral⟩</code> is first converted to a string, with no expansion. The <code>⟨roman numeral⟩</code> may be in upper or lower case; if the numeral contains characters besides <code>mdclxvi</code> or <code>MDCLXVI</code> then the resulting value is -1. This is the inverse function of <code>\int_to_roman:n</code> and <code>\int_to_Roman:n</code> .

<hr/> <code>\int_from_base:nn</code> ★	<code>\int_from_base:nn {⟨number⟩} {⟨base⟩}</code>
<hr/> Updated: 2014-08-25	Converts the <i>⟨number⟩</i> expressed in <i>⟨base⟩</i> into the appropriate value in base 10. The <i>⟨number⟩</i> is first converted to a string, with no expansion. The <i>⟨number⟩</i> should consist of digits and letters (either lower or upper case), plus optionally a leading sign. The maximum <i>⟨base⟩</i> value is 36. This is the inverse function of <code>\int_to_base:nn</code> and <code>\int_to_Base:nn</code> .

## 21.10 Random integers

<hr/> <code>\int_rand:nn</code> ★	<code>\int_rand:nn {⟨int expr<sub>1</sub>⟩} {⟨int expr<sub>2</sub>⟩}</code>
<hr/> New: 2016-12-06 Updated: 2018-04-27	Evaluates the two <i>⟨int expr⟩</i> s and produces a pseudo-random number between the two (with bounds included).

<hr/> <code>\int_rand:n</code> ★	<code>\int_rand:n {⟨int expr⟩}</code>
<hr/> New: 2018-05-05	Evaluates the <i>⟨int expr⟩</i> then produces a pseudo-random number between 1 and the <i>⟨int expr⟩</i> (included).

## 21.11 Viewing integers

<hr/> <code>\int_show:N</code>	<code>\int_show:N ⟨integer⟩</code>
<hr/> <code>\int_show:c</code>	Displays the value of the <i>⟨integer⟩</i> on the terminal.

<hr/> <code>\int_show:n</code>	<code>\int_show:n {⟨int expr⟩}</code>
<hr/> New: 2011-11-22 Updated: 2015-08-07	Displays the result of evaluating the <i>⟨int expr⟩</i> on the terminal.

<hr/> <code>\int_log:N</code>	<code>\int_log:N ⟨integer⟩</code>
<hr/> <code>\int_log:c</code>	Writes the value of the <i>⟨integer⟩</i> in the log file.
<hr/> New: 2014-08-22 Updated: 2015-08-03	

<hr/> <code>\int_log:n</code>	<code>\int_log:n {⟨int expr⟩}</code>
<hr/> New: 2014-08-22 Updated: 2015-08-07	Writes the result of evaluating the <i>⟨int expr⟩</i> in the log file.

## 21.12 Constant integers

<hr/> <code>\c_zero_int</code>	Integer values used with primitive tests and assignments: their self-terminating nature makes these more convenient and faster than literal numbers.
<hr/> <code>\c_one_int</code>	
<hr/> New: 2018-05-07	

---

`\c_max_int` The maximum value that can be stored as an integer.

---

---

`\c_max_register_int` Maximum number of registers.

---

---

`\c_max_char_int` Maximum character code completely supported by the engine.

---

## 21.13 Scratch integers

---

`\l_tmpa_int` Scratch integer for local assignment. These are never used by the kernel code, and so  
`\l_tmpb_int` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
other non-kernel code and so should only be used for short-term storage.

---

---

`\g_tmpa_int` Scratch integer for global assignment. These are never used by the kernel code, and so  
`\g_tmpb_int` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
other non-kernel code and so should only be used for short-term storage.

---

## 21.14 Direct number expansion

---

`\int_value:w` ★ `\int_value:w` *<integer>*  
New: 2018-03-27 `\int_value:w` *<integer denotation>* *<optional space>*

---

Expands the following tokens until an *<integer>* is formed, and leaves a normalized form (no leading sign except for negative numbers, no leading digit 0 except for zero) in the input stream as category code 12 (other) characters. The *<integer>* can consist of any number of signs (with intervening spaces) followed by

- an integer variable (in fact, any T<sub>E</sub>X register except `\toks`) or
- explicit digits (or by ‘*<octal digits>*’ or “*<hexadecimal digits>*” or ‘*<character>*’).

In this last case expansion stops once a non-digit is found; if that is a space it is removed as in `f`-expansion, and so `\exp_stop_f:` may be employed as an end marker. Note that protected functions *are* expanded by this process.

This function requires exactly one expansion to produce a value, and so is suitable for use in cases where a number is required “directly”. In general, `\int_eval:n` is the preferred approach to generating numbers.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\number`.

## 21.15 Primitive conditionals

---

`\if_int_compare:w` ★ `\if_int_compare:w`  $\langle integer_1 \rangle$   $\langle relation \rangle$   $\langle integer_2 \rangle$   
     $\langle true\ code \rangle$   
    `\else:`  
         $\langle false\ code \rangle$   
    `\fi:`

Compare two integers using  $\langle relation \rangle$ , which must be one of =, < or > with category code 12. The `\else:` branch is optional.

**TeXhackers note:** This is the TeX primitive `\ifnum`.

---

`\if_case:w` ★ `\if_case:w`  $\langle integer \rangle$   $\langle case_0 \rangle$   
`\or:` ★ `\or:`  $\langle case_1 \rangle$   
    `\or:` ...  
    `\else:`  $\langle default \rangle$   
    `\fi:`

Selects a case to execute based on the value of the  $\langle integer \rangle$ . The first case ( $\langle case_0 \rangle$ ) is executed if  $\langle integer \rangle$  is 0, the second ( $\langle case_1 \rangle$ ) if the  $\langle integer \rangle$  is 1, etc. The  $\langle integer \rangle$  may be a literal, a constant or an integer expression (*e.g.* using `\int_eval:n`).

**TeXhackers note:** These are the TeX primitives `\ifcase` and `\or`.

---

`\if_int_odd:w` ★ `\if_int_odd:w`  $\langle tokens \rangle$   $\langle optional\ space \rangle$   
     $\langle true\ code \rangle$   
    `\else:`  
         $\langle true\ code \rangle$   
    `\fi:`

Expands  $\langle tokens \rangle$  until a non-numeric token or a space is found, and tests whether the resulting  $\langle integer \rangle$  is odd. If so,  $\langle true\ code \rangle$  is executed. The `\else:` branch is optional.

**TeXhackers note:** This is the TeX primitive `\ifodd`.

## Chapter 22

# The l3flag module

## Expandable flags

Flags are the only data-type that can be modified in expansion-only contexts. This module is meant mostly for kernel use: in almost all cases, booleans or integers should be preferred to flags because they are very significantly faster.

A flag can hold any (small) non-negative value, which we call its *height*. In expansion-only contexts, a flag can only be “raised”: this increases the *height* by 1. The *height* can also be queried expandably. However, decreasing it, or setting it to zero requires non-expandable assignments.

Flag variables are always local.

A typical use case of flags would be to keep track of whether an exceptional condition has occurred during expandable processing, and produce a meaningful (non-expandable) message after the end of the expandable processing. This is exemplified by `l3str-convert`, which for performance reasons performs conversions of individual characters expandably and for readability reasons produces a single error message describing incorrect inputs that were encountered.

Flags should not be used without carefully considering the fact that raising a flag takes a time and memory proportional to its height and that the memory cannot be reclaimed even if the flag is cleared. Flags should not be used unless it is unavoidable.

In earlier versions, flags were referenced by an n-type *flag name* such as `fp_overflow`, used as part of `\use:c` constructions. All of the commands described below have n-type analogues that can still appear in old code, but the N-type commands are to be preferred moving forward. The n-type *flag name* is simply mapped to `\l_<flag name>_flag`, which makes it easier for packages using public flags (such as `l3fp`) to retain backwards compatibility.

### 22.1 Setting up flags

---

<code>\flag_new:N</code>	<code>\flag_new:N &lt;flag var&gt;</code>
--------------------------	---

---

<code>\flag_new:c</code>	
--------------------------	--

---

<code>New: 2024-01-12</code>	Creates a new <i>flag var</i> , or raises an error if the name is already taken. The declaration is global, but flags are always local variables. The <i>flag var</i> initially has zero height.
------------------------------	--

---

---

<code>\flag_clear:N</code>	<code>\flag_clear:N</code> $\langle flag\ var \rangle$
<code>\flag_clear:c</code>	Sets the height of the $\langle flag\ var \rangle$ to zero. The assignment is local.
New: 2024-01-12	

---

---

<code>\flag_clear_new:N</code>	<code>\flag_clear_new:N</code> $\langle flag\ var \rangle$
<code>\flag_clear_new:c</code>	Ensures that the $\langle flag\ var \rangle$ exists globally by applying <code>\flag_new:N</code> if necessary, then applies <code>\flag_clear:N</code> , setting the height to zero locally.
New: 2024-01-12	

---

---

<code>\flag_show:N</code>	<code>\flag_show:N</code> $\langle flag\ var \rangle$
<code>\flag_show:c</code>	Displays the height of the $\langle flag\ var \rangle$ in the terminal.
New: 2024-01-12	

---

---

<code>\flag_log:N</code>	<code>\flag_log:N</code> $\langle flag\ var \rangle$
<code>\flag_log:c</code>	Writes the height of the $\langle flag\ var \rangle$ in the log file.
New: 2024-01-12	

---

## 22.2 Expandable flag commands

---

<code>\flag_if_exist_p:N</code>	<code>\flag_if_exist_p:N</code> $\langle flag\ var \rangle$
<code>\flag_if_exist_p:c</code>	<code>\flag_if_exist:NTF</code> $\langle flag\ var \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\flag_if_exist:NTF</code>	$\star$ This function returns <code>true</code> if the $\langle flag\ var \rangle$ is currently defined, and <code>false</code> otherwise.
<code>\flag_if_exist:cTF</code>	$\star$ This does not check that the $\langle flag\ var \rangle$ really is a flag variable.
New: 2024-01-12	

---

---

<code>\flag_if_raised_p:N</code>	<code>\flag_if_raised_p:N</code> $\langle flag\ var \rangle$
<code>\flag_if_raised_p:c</code>	<code>\flag_if_raised:NTF</code> $\langle flag\ var \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\flag_if_raised:NTF</code>	$\star$ This function returns <code>true</code> if the $\langle flag\ var \rangle$ has non-zero height, and <code>false</code> if the
<code>\flag_if_raised:cTF</code>	$\star$ $\langle flag\ var \rangle$ has zero height.
New: 2024-01-12	

---

---

<code>\flag_height:N</code>	<code>\flag_height:N</code> $\langle flag\ var \rangle$
<code>\flag_height:c</code>	Expands to the height of the $\langle flag\ var \rangle$ as an integer denotation.
New: 2024-01-12	

---

---

<code>\flag_raise:N</code>	<code>\flag_raise:N</code> $\langle flag\ var \rangle$
<code>\flag_raise:c</code>	$\star$ The height of $\langle flag\ var \rangle$ is increased by 1 locally.
New: 2024-01-12	

---

---

<code>\flag_ensure_raised:N</code>	<code>\flag_ensure_raised:N</code> $\langle flag\ var \rangle$
<code>\flag_ensure_raised:c</code>	$\star$ Ensures the $\langle flag\ var \rangle$ is raised by making its height at least 1, locally.
New: 2024-01-12	

---

---

<code>\l_tmpa_flag</code>	Scratch flag for local assignment. These are never used by the kernel code, and so are safe
<code>\l_tmpb_flag</code>	for use with any $\text{\LaTeX}$ 3-defined function. However, they may be overwritten by other
<small>New: 2024-01-12</small>	non-kernel code and so should only be used for short-term storage.

---

## Chapter 23

# The l3clist module

## Comma separated lists

Comma lists (in short, `clist`) contain ordered data where items can be added to the left or right end of the list. This data type allows basic list manipulations such as adding/removing items, applying a function to every item, removing duplicate items, extracting a given item, using the comma list with specified separators, and so on. Sequences (defined in `l3seq`) are safer, faster, and provide more features, so they should often be preferred to comma lists. Comma lists are mostly useful when interfacing with  $\text{\LaTeX}2_{\epsilon}$  or other code that expects or provides items separated by commas.

Several items can be added at once. To ease input of comma lists from data provided by a user outside an `\ExplSyntaxOn ... \ExplSyntaxOff` block, spaces are removed from both sides of each comma-delimited argument upon input. Blank arguments are ignored, to allow for trailing commas or repeated commas (which may otherwise arise when concatenating comma lists “by hand”). In addition, a set of braces is removed if the result of space-trimming is braced: this allows the storage of any item in a comma list. For instance,

```
\clist_new:N \l_my_clist
\clist_put_left:Nn \l_my_clist { ~a~ , ~{b}~ , c~\d }
\clist_put_right:Nn \l_my_clist { ~{e~} , , {{f}} , }
```

results in `\l_my_clist` containing `a,b,c~\d,{e~},{{f}}` namely the five items `a`, `b`, `c~\d`, `e~` and `{f}`. Comma lists normally do not contain empty or blank items so the following gives an empty comma list:

```
\clist_clear_new:N \l_my_clist
\clist_set:Nn \l_my_clist { , ~ , , }
\clist_if_empty:NTF \l_my_clist { true } { false }
```

and it leaves `true` in the input stream. To include an “unsafe” item (empty, or one that contains a comma, or starts or ends with a space, or is a single brace group), surround it with braces.

Any `n`-type token list is a valid comma list input for `l3clist` functions, which will split the token list at every comma and process the items as described above. On the other hand, `N`-type functions expect comma list variables, which are particular token list variables in which this processing of items (and removal of blank items) has already

occurred. Because comma list variables are token list variables, expanding them once yields their items separated by commas, and `l3tl` functions such as `\tl_show:N` can be applied to them. (These functions often have `l3clist` analogues, which should be preferred.)

Almost all operations on comma lists are noticeably slower than those on sequences so converting the data to sequences using `\seq_set_from_clist:Nn` (see `l3seq`) may be advisable if speed is important. The exception is that `\clist_if_in:NnTF` and `\clist_remove_duplicates:N` may be faster than their sequence analogues for large lists. However, these functions work slowly for “unsafe” items that must be braced, and may produce errors when their argument contains `{`, `}` or `#` (assuming the usual `TeX` category codes apply). The sequence data type should thus certainly be preferred to comma lists to store such items.

## 23.1 Creating and initialising comma lists

---

<code>\clist_new:N</code>	<code>\clist_new:N</code> $\langle$ <i>clist var</i> $\rangle$
---------------------------	--

---

<code>\clist_new:c</code>	Creates a new $\langle$ <i>clist var</i> $\rangle$ or raises an error if the name is already taken. The declaration is global. The $\langle$ <i>clist var</i> $\rangle$ initially contains no items.
---------------------------	--

---

<code>\clist_const:Nn</code>	<code>\clist_const:Nn</code> $\langle$ <i>clist var</i> $\rangle$ $\{$ <i>comma list</i> $\}$
------------------------------	---

---

<code>\clist_const:(Ne cn ce)</code>	Creates a new constant $\langle$ <i>clist var</i> $\rangle$ or raises an error if the name is already taken. The value of the $\langle$ <i>clist var</i> $\rangle$ is set globally to the $\langle$ <i>comma list</i> $\rangle$ .
--------------------------------------	---

New: 2014-07-05

---

<code>\clist_clear:N</code>	<code>\clist_clear:N</code> $\langle$ <i>clist var</i> $\rangle$
-----------------------------	--

---

<code>\clist_clear:c</code>	Clears all items from the $\langle$ <i>clist var</i> $\rangle$ .
-----------------------------	--

---

<code>\clist_gclear:N</code>	
------------------------------	--

---

<code>\clist_gclear:c</code>	
------------------------------	--

---

<code>\clist_clear_new:N</code>	<code>\clist_clear_new:N</code> $\langle$ <i>clist var</i> $\rangle$
---------------------------------	--

---

<code>\clist_clear_new:c</code>	Ensures that the $\langle$ <i>clist var</i> $\rangle$ exists globally by applying <code>\clist_new:N</code> if necessary, then applies <code>\clist_(g)clear:N</code> to leave the list empty.
---------------------------------	--

---

<code>\clist_gclear_new:N</code>	
----------------------------------	--

---

<code>\clist_gclear_new:c</code>	
----------------------------------	--

---

<code>\clist_set_eq:NN</code>	<code>\clist_set_eq:NN</code> $\langle$ <i>clist var</i> <sub>1</sub> $\rangle$ $\langle$ <i>clist var</i> <sub>2</sub> $\rangle$
-------------------------------	---

---

<code>\clist_set_eq:(cN Nc cc)</code>	Sets the content of $\langle$ <i>clist var</i> <sub>1</sub> $\rangle$ equal to that of $\langle$ <i>clist var</i> <sub>2</sub> $\rangle$ . To set a token list variable equal to a comma list variable, use <code>\tl_set_eq:NN</code> . Conversely, setting a comma list variable to a token list is unadvisable unless one checks space-trimming and related issues.
---------------------------------------	--

---

<code>\clist_gset_eq:NN</code>	
--------------------------------	--

---

<code>\clist_gset_eq:(cN Nc cc)</code>	
--	--

---

<code>\clist_set_from_seq:NN</code>	<code>\clist_set_from_seq:NN</code> $\langle$ <i>clist var</i> $\rangle$ $\langle$ <i>seq var</i> $\rangle$
-------------------------------------	---

---

<code>\clist_set_from_seq:(cN Nc cc)</code>	
---	--

---

<code>\clist_gset_from_seq:NN</code>	
--------------------------------------	--

---

<code>\clist_gset_from_seq:(cN Nc cc)</code>	
--	--

New: 2014-07-17

---

Converts the data in the  $\langle$ *seq var* $\rangle$  into a  $\langle$ *clist var* $\rangle$ : the original  $\langle$ *seq var* $\rangle$  is unchanged. Items which contain either spaces or commas are surrounded by braces.

---

<code>\clist_concat:NNN</code>	<code>\clist_concat:NNN</code> $\langle\textit{clist var}_1\rangle$ $\langle\textit{clist var}_2\rangle$ $\langle\textit{clist var}_3\rangle$
<code>\clist_concat:ccc</code>	
<code>\clist_gconcat:NNN</code>	Concatenates the content of $\langle\textit{clist var}_2\rangle$ and $\langle\textit{clist var}_3\rangle$ together and saves the
<code>\clist_gconcat:ccc</code>	result in $\langle\textit{clist var}_1\rangle$ . The items in $\langle\textit{clist var}_2\rangle$ are placed at the left side of the new

---

comma list.

---

<code>\clist_if_exist_p:N</code>	<code>\clist_if_exist_p:N</code> $\langle\textit{clist var}\rangle$
<code>\clist_if_exist_p:c</code>	<code>\clist_if_exist:NTF</code> $\langle\textit{clist var}\rangle$ $\{\langle\textit{true code}\rangle\}$ $\{\langle\textit{false code}\rangle\}$
<code>\clist_if_exist:NTF</code>	<code>\clist_if_exist:NTF</code> $\star$ Tests whether the $\langle\textit{clist var}\rangle$ is currently defined. This does not check that the
<code>\clist_if_exist:cTF</code>	<code>\clist_if_exist:cTF</code> $\star$ $\langle\textit{clist var}\rangle$ really is a comma list.

---

New: 2012-03-03

---

## 23.2 Adding data to comma lists

---

<code>\clist_set:Nn</code>	<code>\clist_set:Nn</code> $\langle\textit{clist var}\rangle$ $\{\langle\textit{item}_1\rangle,\dots,\langle\textit{item}_n\rangle\}$
<code>\clist_set:(NV Ne No cn cV ce co)</code>	
<code>\clist_gset:Nn</code>	
<code>\clist_gset:(NV Ne No cn cV ce co)</code>	

---

New: 2011-09-06

---

Sets  $\langle\textit{clist var}\rangle$  to contain the  $\langle\textit{items}\rangle$ , removing any previous content from the variable. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To store some  $\langle\textit{tokens}\rangle$  as a single  $\langle\textit{item}\rangle$  even if the  $\langle\textit{tokens}\rangle$  contain commas or spaces, add a set of braces: `\clist_set:Nn`  $\langle\textit{clist var}\rangle$   $\{\{\langle\textit{tokens}\rangle\}\}$ .

---

<code>\clist_put_left:Nn</code>	<code>\clist_put_left:Nn</code> $\langle\textit{clist var}\rangle$ $\{\langle\textit{item}_1\rangle,\dots,\langle\textit{item}_n\rangle\}$
<code>\clist_put_left:(NV Nv Ne No cn cV cv ce co)</code>	
<code>\clist_gput_left:Nn</code>	
<code>\clist_gput_left:(NV Nv Ne No cn cV cv ce co)</code>	

---

Updated: 2011-09-05

---

Appends the  $\langle\textit{items}\rangle$  to the left of the  $\langle\textit{clist var}\rangle$ . Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some  $\langle\textit{tokens}\rangle$  as a single  $\langle\textit{item}\rangle$  even if the  $\langle\textit{tokens}\rangle$  contain commas or spaces, add a set of braces: `\clist_put_left:Nn`  $\langle\textit{clist var}\rangle$   $\{\{\langle\textit{tokens}\rangle\}\}$ .

---

<code>\clist_put_right:Nn</code>	<code>\clist_put_right:Nn</code> $\langle\textit{clist var}\rangle$ $\{\langle\textit{item}_1\rangle,\dots,\langle\textit{item}_n\rangle\}$
<code>\clist_put_right:(NV Nv Ne No cn cV cv ce co)</code>	
<code>\clist_gput_right:Nn</code>	
<code>\clist_gput_right:(NV Nv Ne No cn cV cv ce co)</code>	

---

Updated: 2011-09-05

---

Appends the  $\langle\textit{items}\rangle$  to the right of the  $\langle\textit{clist var}\rangle$ . Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some  $\langle\textit{tokens}\rangle$  as a single  $\langle\textit{item}\rangle$  even if the  $\langle\textit{tokens}\rangle$  contain commas or spaces, add a set of braces: `\clist_put_right:Nn`  $\langle\textit{clist var}\rangle$   $\{\{\langle\textit{tokens}\rangle\}\}$ .

## 23.3 Modifying comma lists

While comma lists are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update comma lists, while retaining the order of the unaffected entries.

---

```
\clist_remove_duplicates:N \clist_remove_duplicates:N <clist var>
\clist_remove_duplicates:c
\clist_gremove_duplicates:N
\clist_gremove_duplicates:c
```

---

Removes duplicate items from the  $\langle\textit{clist var}\rangle$ , leaving the left most copy of each item in the  $\langle\textit{clist var}\rangle$ . The  $\langle\textit{item}\rangle$  comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

**T<sub>E</sub>Xhackers note:** This function iterates through every item in the  $\langle\textit{clist var}\rangle$  and does a comparison with the  $\langle\textit{items}\rangle$  already checked. It is therefore relatively slow with large comma lists. Furthermore, it may fail if any of the items in the  $\langle\textit{clist var}\rangle$  contains `{`, `}`, or `#` (assuming the usual T<sub>E</sub>X category codes apply).

---

```
\clist_remove_all:Nn \clist_remove_all:Nn <clist var> {<item>}
\clist_remove_all:(cn|NV|cV|Ne|ce)
\clist_gremove_all:Nn
\clist_gremove_all:(cn|NV|cV|Ne|ce)
```

---

Updated: 2011-09-06

---

Removes every occurrence of  $\langle\textit{item}\rangle$  from the  $\langle\textit{clist var}\rangle$ . The  $\langle\textit{item}\rangle$  comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

**T<sub>E</sub>Xhackers note:** The function may fail if the  $\langle\textit{item}\rangle$  contains `{`, `}`, or `#` (assuming the usual T<sub>E</sub>X category codes apply).

---

```
\clist_reverse:N \clist_reverse:N <clist var>
\clist_reverse:c
\clist_greverse:N
\clist_greverse:c
```

---

New: 2014-07-18

---

---

```
\clist_reverse:n ★ \clist_reverse:n {<comma list>}
```

---

New: 2014-07-18

---

Leaves the items in the  $\langle\textit{comma list}\rangle$  in the input stream in reverse order. Contrarily to other what is done for other n-type  $\langle\textit{comma list}\rangle$  arguments, braces and spaces are preserved by this process.

**T<sub>E</sub>Xhackers note:** The result is returned within `\unexpanded`, which means that the comma list does not expand further when appearing in an e-type or x-type argument expansion.

<code>\clist_sort:Nn</code>	<code>\clist_sort:Nn &lt;clist var&gt; {&lt;comparison code&gt;}</code>
<code>\clist_sort:cn</code>	
<code>\clist_gsort:Nn</code>	Sorts the items in the <code>&lt;clist var&gt;</code> according to the <code>&lt;comparison code&gt;</code> , and assigns the
<code>\clist_gsort:cn</code>	result to <code>&lt;clist var&gt;</code> . The details of sorting comparison are described in Section 6.1.
New: 2017-02-06	

## 23.4 Comma list conditionals

<code>\clist_if_empty_p:N</code>	<code>\clist_if_empty_p:N &lt;clist var&gt;</code>
<code>\clist_if_empty_p:c</code>	<code>\clist_if_empty:NTF &lt;clist var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\clist_if_empty:NTF</code>	
<code>\clist_if_empty:cTF</code>	Tests if the <code>&lt;clist var&gt;</code> is empty (containing no items).

<code>\clist_if_empty_p:n</code>	<code>\clist_if_empty_p:n {&lt;comma list&gt;}</code>
<code>\clist_if_empty:nTF</code>	<code>\clist_if_empty:nTF {&lt;comma list&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
New: 2014-07-05	
Tests if the <code>&lt;comma list&gt;</code> is empty (containing no items). The rules for space trimming are as for other n-type comma-list functions, hence the comma list <code>{~,~,~,~}</code> (without outer braces) is empty, while <code>{~,{}},}</code> (without outer braces) contains one element, which happens to be empty: the comma-list is not empty.	

<code>\clist_if_in:NnTF</code>	<code>\clist_if_in:NnTF &lt;clist var&gt; {&lt;item&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\clist_if_in:(NV No cn cV co)TF</code>	
<code>\clist_if_in:nnTF</code>	
<code>\clist_if_in:(nV no)TF</code>	

Updated: 2011-09-06

Tests if the `<item>` is present in the `<clist var>`. In the case of an n-type `<comma list>`, the usual rules of space trimming and brace stripping apply. Hence,

```
\clist_if_in:nnTF { a , {b}~ , {b} , c } { b } {true} {false}
```

yields true.

**T<sub>E</sub>Xhackers note:** The function may fail if the `<item>` contains `{`, `}`, or `#` (assuming the usual T<sub>E</sub>X category codes apply).

## 23.5 Mapping over comma lists

The functions described in this section apply a specified function to each item of a comma list. All mappings are done at the current group level, i.e., any local assignments made by the `<function>` or `<code>` discussed below remain in effect after the loop.

When the comma list is given explicitly, as an n-type argument, spaces are trimmed around each item. If the result of trimming spaces is empty, the item is ignored. Otherwise, if the item is surrounded by braces, one set is removed, and the result is passed to the mapped function. Thus, if the comma list that is being mapped is `{a_,{b}_,{}_{c},}` then the arguments passed to the mapped function are ‘a’, ‘{b}\_’, an empty argument, and ‘c’.

When the comma list is given as an N-type argument, spaces have already been trimmed on input, and items are simply stripped of one set of braces if any. This case is more efficient than using n-type comma lists.

---

<code>\clist_map_function:NN</code>	☆	<code>\clist_map_function:NN</code>	$\langle\textit{clist var}\rangle$ $\langle\textit{function}\rangle$
<code>\clist_map_function:cN</code>	☆		
<code>\clist_map_function:nN</code>	☆		Applies $\langle\textit{function}\rangle$ to every $\langle\textit{item}\rangle$ stored in the $\langle\textit{clist var}\rangle$ . The $\langle\textit{function}\rangle$ receives one argument for each iteration. The $\langle\textit{items}\rangle$ are returned from left to right. The function <code>\clist_map_inline:Nn</code> is in general more efficient than <code>\clist_map_function:NN</code> .
<code>\clist_map_function:eN</code>	☆		

---

Updated: 2012-06-29

---

<code>\clist_map_inline:Nn</code>		<code>\clist_map_inline:Nn</code>	$\langle\textit{clist var}\rangle$ $\{\langle\textit{inline function}\rangle\}$
<code>\clist_map_inline:cN</code>			
<code>\clist_map_inline:nN</code>			Applies $\langle\textit{inline function}\rangle$ to every $\langle\textit{item}\rangle$ stored within the $\langle\textit{clist var}\rangle$ . The $\langle\textit{inline function}\rangle$ should consist of code which receives the $\langle\textit{item}\rangle$ as #1. The $\langle\textit{items}\rangle$ are returned from left to right.

---

Updated: 2012-06-29

---

<code>\clist_map_variable:NNn</code>		<code>\clist_map_variable:NNn</code>	$\langle\textit{clist var}\rangle$ $\langle\textit{variable}\rangle$ $\{\langle\textit{code}\rangle\}$
<code>\clist_map_variable:cNn</code>			
<code>\clist_map_variable:nNn</code>			Stores each $\langle\textit{item}\rangle$ of the $\langle\textit{clist var}\rangle$ in turn in the (token list) $\langle\textit{variable}\rangle$ and applies the $\langle\textit{code}\rangle$ . The $\langle\textit{code}\rangle$ will usually make use of the $\langle\textit{variable}\rangle$ , but this is not enforced. The assignments to the $\langle\textit{variable}\rangle$ are local. Its value after the loop is the last $\langle\textit{item}\rangle$ in the $\langle\textit{clist var}\rangle$ , or its original value if there were no $\langle\textit{item}\rangle$ . The $\langle\textit{items}\rangle$ are returned from left to right.

---

Updated: 2012-06-29

---

<code>\clist_map_tokens:Nn</code>	☆	<code>\clist_map_tokens:Nn</code>	$\langle\textit{clist var}\rangle$ $\{\langle\textit{code}\rangle\}$
<code>\clist_map_tokens:cN</code>	☆	<code>\clist_map_tokens:nN</code>	$\{\langle\textit{comma list}\rangle\}$ $\{\langle\textit{code}\rangle\}$
<code>\clist_map_tokens:nN</code>	☆		Calls $\langle\textit{code}\rangle$ $\{\langle\textit{item}\rangle\}$ for every $\langle\textit{item}\rangle$ stored in the $\langle\textit{clist var}\rangle$ . The $\langle\textit{code}\rangle$ receives each $\langle\textit{item}\rangle$ as a trailing brace group. If the $\langle\textit{code}\rangle$ consists of a single function this is equivalent to <code>\clist_map_function:nN</code> .

---

New: 2021-05-05

---

<code>\clist_map_break:</code>	☆	<code>\clist_map_break:</code>	
--------------------------------	---	--------------------------------	--

---

Updated: 2012-06-29

Used to terminate a `\clist_map...` function before all entries in the  $\langle\textit{comma list}\rangle$  have been processed. This normally takes place within a conditional statement, for example

```
\clist_map_inline:Nn \l_my_clist
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \clist_map_break: }
  {
    % Do something useful
  }
}
```

Use outside of a `\clist_map...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

`\clist_map_break:n` ☆ `\clist_map_break:n {<code>}`

---

Updated: 2012-06-29

Used to terminate a `\clist_map_...` function before all entries in the *<comma list>* have been processed, inserting the *<code>* after the mapping has ended. This normally takes place within a conditional statement, for example

```
\clist_map_inline:Nn \l_my_clist
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \clist_map_break:n { <code> } }
  {
    % Do something useful
  }
}
```

Use outside of a `\clist_map_...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before the *<code>* is inserted into the input stream. This depends on the design of the mapping function.

---

`\clist_count:N` ★ `\clist_count:N <clist var>`

`\clist_count:c` ★

`\clist_count:n` ★

`\clist_count:e` ★

Leaves the number of items in the *<clist var>* in the input stream as an *<integer denotation>*. The total number of items in a *<clist var>* includes those which are duplicates, i.e., every item in a *<clist var>* is counted.

New: 2012-07-13

---

## 23.6 Using the content of comma lists directly

---

<code>\clist_use:Nnnn</code>	★	<code>\clist_use:Nnnn &lt;clist var&gt; {&lt;separator between two&gt;}</code>
<code>\clist_use:cnnn</code>	★	<code>{&lt;separator between more than two&gt;} {&lt;separator between final two&gt;}</code>
<hr/>		
New: 2013-05-26		Places the contents of the <code>&lt;clist var&gt;</code> in the input stream, with the appropriate <code>&lt;separator&gt;</code> between the items. Namely, if the comma list has more than two items, the <code>&lt;separator between more than two&gt;</code> is placed between each pair of items except the last, for which the <code>&lt;separator between final two&gt;</code> is used. If the comma list has exactly two items, then they are placed in the input stream separated by the <code>&lt;separator between two&gt;</code> . If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.

---

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nnnn \l_tmpa_clist { ~and~ } { ,~ } { ,~and~ }
```

inserts “a, b, c, de, and f” in the input stream. The first separator argument is not used in this case because the comma list has more than 2 items.

**T<sub>E</sub>Xhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<items>` do not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

<code>\clist_use:Nn</code>	★	<code>\clist_use:Nn &lt;clist var&gt; {&lt;separator&gt;}</code>
<code>\clist_use:cn</code>	★	Places the contents of the <code>&lt;clist var&gt;</code> in the input stream, with the <code>&lt;separator&gt;</code> between the items. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.
<hr/>		
New: 2013-05-26		

---

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nn \l_tmpa_clist { ~and~ }
```

inserts “a and b and c and de and f” in the input stream.

**T<sub>E</sub>Xhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<items>` do not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

<code>\clist_use:N</code>	★	<code>\clist_use:N &lt;clist var&gt;</code>
<code>\clist_use:c</code>	★	Places the contents of the <code>&lt;clist var&gt;</code> in the input stream, with a comma between each item. The result is exactly the stored <code>&lt;clist&gt;</code> , which will include braces around (for example) entries with retained spaces at the ends.
<hr/>		
New: 2024-11-12		

---

**T<sub>E</sub>Xhackers note:** The result is returned as-is, in the same way as `\tl_use:N` and *without* protection from expansion, cf. `\clist_use:Nnnnn`, etc. It is equivalent to V-type expansion of a `clist`.

---

<code>\clist_use:nnnn</code>	★	<code>\clist_use:nnnn {⟨comma list⟩} {⟨separator between two⟩}</code>
<code>\clist_use:nn</code>	★	<code>{⟨separator between more than two⟩} {⟨separator between final two⟩}</code>
<hr/>		
New: 2021-05-10		

---

Places the contents of the `⟨comma list⟩` in the input stream, with the appropriate `⟨separator⟩` between the items. As for `\clist_set:Nn`, blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. The `⟨separators⟩` are then inserted in the same way as for `\clist_use:Nnnn` and `\clist_use:Nn`, respectively.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `⟨items⟩` do not expand further when appearing in an `e`-type or `x`-type argument expansion.

## 23.7 Comma lists as stacks

Comma lists can be used as stacks, where data is pushed to and popped from the top of the comma list. (The left of a comma list is the top, for performance reasons.) The stack functions for comma lists are not intended to be mixed with the general ordered data functions detailed in the previous section: a comma list should either be used as an ordered data type or as a stack, but not in both ways.

<code>\clist_get:NN</code>	<code>\clist_get:NN</code> $\langle\textit{clist var}\rangle$ $\langle\textit{tl var}\rangle$
<code>\clist_get:cN</code>	Stores the left-most item from a $\langle\textit{clist var}\rangle$ in the $\langle\textit{tl var}\rangle$ without removing it from the $\langle\textit{clist var}\rangle$ . The $\langle\textit{tl var}\rangle$ is assigned locally. In the non-branching version, if the $\langle\textit{clist var}\rangle$ is empty the $\langle\textit{tl var}\rangle$ is set to the marker value <code>\q_no_value</code> .
<code>\clist_get:NNTF</code>	
<code>\clist_get:cNTF</code>	
<hr/>	
New: 2012-05-14	
Updated: 2019-02-16	

<code>\clist_pop:NN</code>	<code>\clist_pop:NN &lt;clist var&gt; &lt;tl var&gt;</code>	
<code>\clist_pop:cN</code>	Pops the left-most item from a <code>&lt;clist var&gt;</code> into the <code>&lt;tl var&gt;</code> , i.e., removes the item from the comma list and stores it in the <code>&lt;tl var&gt;</code> . Both of the variables are assigned locally.	
<hr/>		
Updated: 2011-09-06		

<code>\clist_gpop:NN</code>	<code>\clist_gpop:NN</code> $\langle clist\ var \rangle$ $\langle tl\ var \rangle$
<u><code>\clist_gpop:cN</code></u>	Pops the left-most item from a $\langle clist\ var \rangle$ into the $\langle tl\ var \rangle$ , i.e., removes the item from the comma list and stores it in the $\langle tl\ var \rangle$ . The $\langle clist\ var \rangle$ is modified globally, while the assignment of the $\langle tl\ var \rangle$ is local.

<code>\clist_pop:NNTF</code>	<code>\clist_pop:NNTF &lt;clist var&gt; &lt;tl var&gt; {(true code)} {(false code)}</code>	
<code>\clist_pop:cNTF</code>	If the <code>&lt;clist var&gt;</code> is empty, leaves the <code>&lt;false code&gt;</code> in the input stream. The value of the <code>&lt;tl var&gt;</code> is not defined in this case and should not be relied upon. If the <code>&lt;clist var&gt;</code> is non-empty, pops the top item from the <code>&lt;clist var&gt;</code> in the <code>&lt;tl var&gt;</code> , i.e., removes the item from the <code>&lt;clist var&gt;</code> . Both the <code>&lt;clist var&gt;</code> and the <code>&lt;tl var&gt;</code> are assigned locally.	
<hr/>		
New: 2012-05-14		

---

<hr/>	
<code>\clist_gpop:NNTF</code>	<code>\clist_gpop:NNTF &lt;clist var&gt; &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\clist_gpop:cNTF</code>	If the <code>&lt;clist var&gt;</code> is empty, leaves the <code>&lt;false code&gt;</code> in the input stream. The value of the <code>&lt;tl var&gt;</code> is not defined in this case and should not be relied upon. If the <code>&lt;clist var&gt;</code> is non-empty, pops the top item from the <code>&lt;clist var&gt;</code> in the <code>&lt;tl var&gt;</code> , i.e., removes the item from the <code>&lt;clist var&gt;</code> . The <code>&lt;clist var&gt;</code> is modified globally, while the <code>&lt;tl var&gt;</code> is assigned locally.
<hr/>	
New: 2012-05-14	

<hr/>	
<code>\clist_push:Nn</code>	<code>\clist_push:Nn &lt;clist var&gt; {&lt;items&gt;}</code>
<code>\clist_push:(NV No cn cV co)</code>	
<code>\clist_gpush:Nn</code>	
<code>\clist_gpush:(NV No cn cV co)</code>	
<hr/>	

Adds the `{<items>}` to the top of the `<clist var>`. Spaces are removed from both sides of each item as for any n-type comma list.

## 23.8 Using a single item

<hr/>	
<code>\clist_item:Nn *</code>	<code>\clist_item:Nn &lt;clist var&gt; {&lt;int expr&gt;}</code>
<code>\clist_item:cn *</code>	Indexing items in the <code>&lt;clist var&gt;</code> from 1 at the top (left), this function evaluates the
<code>\clist_item:nn *</code>	<code>&lt;int expr&gt;</code> and leaves the appropriate item from the comma list in the input stream.
<code>\clist_item:en *</code>	If the <code>&lt;int expr&gt;</code> is negative, indexing occurs from the bottom (right) of the comma list. When the <code>&lt;int expr&gt;</code> is larger than the number of items in the <code>&lt;clist var&gt;</code> (as calculated by <code>\clist_count:N</code> ) then the function expands to nothing.
<hr/>	
New: 2014-07-17	

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<item>` does not expand further when appearing in an e-type or x-type argument expansion.

<hr/>	
<code>\clist_rand_item:N *</code>	<code>\clist_rand_item:N &lt;clist var&gt;</code>
<code>\clist_rand_item:c *</code>	<code>\clist_rand_item:n {&lt;comma list&gt;}</code>
<code>\clist_rand_item:n *</code>	Selects a pseudo-random item of the <code>&lt;clist var&gt;/&lt;comma list&gt;</code> . If the <code>&lt;comma list&gt;</code> has no item, the result is empty.
<hr/>	
New: 2016-12-06	

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<item>` does not expand further when appearing in an e-type or x-type argument expansion.

## 23.9 Viewing comma lists

<hr/>	
<code>\clist_show:N</code>	<code>\clist_show:N &lt;clist var&gt;</code>
<code>\clist_show:c</code>	Displays the entries in the <code>&lt;clist var&gt;</code> in the terminal.
<hr/>	
Updated: 2021-04-29	

<hr/> <code>\clist_show:n</code> <hr/>	<code>\clist_show:n {\tokens}</code>
<code>Updated: 2013-08-03</code>	Displays the entries in the comma list in the terminal.
<hr/> <code>\clist_log:N</code> <hr/>	<code>\clist_log:N &lt;clist var&gt;</code>
<code>\clist_log:c</code>	Writes the entries in the <code>&lt;clist var&gt;</code> in the log file. See also <code>\clist_show:N</code> which displays the result in the terminal.
<code>New: 2014-08-22</code>	
<code>Updated: 2021-04-29</code>	
<hr/> <code>\clist_log:n</code> <hr/>	<code>\clist_log:n {\tokens}</code>
<code>New: 2014-08-22</code>	Writes the entries in the comma list in the log file. See also <code>\clist_show:n</code> which displays the result in the terminal.

## 23.10 Constant and scratch comma lists

<hr/> <code>\c_empty_clist</code> <hr/>	Constant that is always empty.
<code>New: 2012-07-02</code>	
<hr/> <code>\l_tmpa_clist</code> <hr/>	Scratch comma lists for local assignment. These are never used by the kernel code, and
<code>\l_tmpb_clist</code>	so are safe for use with any $\text{\LaTeX}3$ -defined function. However, they may be overwritten
<code>New: 2011-09-06</code>	by other non-kernel code and so should only be used for short-term storage.
<hr/> <code>\g_tmpa_clist</code> <hr/>	Scratch comma lists for global assignment. These are never used by the kernel code, and
<code>\g_tmpb_clist</code>	so are safe for use with any $\text{\LaTeX}3$ -defined function. However, they may be overwritten
<code>New: 2011-09-06</code>	by other non-kernel code and so should only be used for short-term storage.

## Chapter 24

# The l3token module

## Token manipulation

This module deals with tokens. Now this is perhaps not the most precise description so let's try with a better description: When programming in T<sub>E</sub>X, it is often desirable to know just what a certain token is: is it a control sequence or something else. Similarly one often needs to know if a control sequence is expandable or not, a macro or a primitive, how many arguments it takes etc. Another thing of great importance (especially when it comes to document commands) is looking ahead in the token stream to see if a certain character is present and maybe even remove it or disregard other tokens while scanning. This module provides functions for both and as such has two primary function categories: `\token_` for anything that deals with tokens and `\peek_` for looking ahead in the token stream.

Most functions we describe here can be used on control sequences, as those are tokens as well.

It is important to distinguish two aspects of a token: its “shape” (for lack of a better word), which affects the matching of delimited arguments and the comparison of token lists containing this token, and its “meaning”, which affects whether the token expands or what operation it performs. One can have tokens of different shapes with the same meaning, but not the converse.

For instance, `\if:w`, `\if_charcode:w`, and `\tex_if:D` are three names for the same internal operation of T<sub>E</sub>X, namely the primitive testing the next two characters for equality of their character code. They have the same meaning hence behave identically in many situations. However, T<sub>E</sub>X distinguishes them when searching for a delimited argument. Namely, the example function `\show_until_if:w` defined below takes everything until `\if:w` as an argument, despite the presence of other copies of `\if:w` under different names.

```
\cs_new:Npn \show_until_if:w #1 \if:w { \tl_show:n {#1} }  
\show_until_if:w \tex_if:D \if_charcode:w \if:w
```

A list of all possible shapes and a list of all possible meanings are given in section [24.7](#).

## 24.1 Creating character tokens

<code>\char_set_active_eq:NN</code>	<code>\char_set_active_eq:NN &lt;char&gt; &lt;function&gt;</code>
<code>\char_set_active_eq:Nc</code>	
<code>\char_gset_active_eq:NN</code>	Sets the behaviour of the <code>&lt;char&gt;</code> in situations where it is active (category code 13) to be equivalent to that of the definition of the <code>&lt;function&gt;</code> at the time <code>\char_set_active_eq:NN</code> is used. The category code of the <code>&lt;char&gt;</code> is <i>unchanged</i> by this process. The <code>&lt;function&gt;</code> may itself be an active character.
<code>\char_gset_active_eq:Nc</code>	
Updated: 2015-11-12	

<code>\char_set_active_eq:nN</code>	<code>\char_set_active_eq:nN {&lt;integer expression&gt;} &lt;function&gt;</code>
<code>\char_set_active_eq:nc</code>	
<code>\char_gset_active_eq:nN</code>	Sets the behaviour of the <code>&lt;char&gt;</code> which has character code as given by the <code>&lt;integer expression&gt;</code> in situations where it is active (category code 13) to be equivalent to that of the <code>&lt;function&gt;</code> at the time <code>\char_set_active_eq:nN</code> is used. The category code of the <code>&lt;char&gt;</code> is <i>unchanged</i> by this process. The <code>&lt;function&gt;</code> may itself be an active character.
<code>\char_gset_active_eq:nc</code>	
New: 2015-11-12	

<code>\char_generate:nn *</code>	<code>\char_generate:nn {&lt;charcode&gt;} {&lt;catcode&gt;}</code>
New: 2015-09-09	
Updated: 2019-01-16	Generates a character token of the given <code>&lt;charcode&gt;</code> and <code>&lt;catcode&gt;</code> (both of which may be integer expressions). The <code>&lt;catcode&gt;</code> may be one of

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

and other values raise an error. The `<charcode>` may be any one valid for the engine in use, except that for `<catcode>` 10, `<charcode>` 0 is not allowed. Active characters cannot be generated in older versions of  $\TeX$ . Another way to build token lists with unusual category codes is `\regex_replace_all:nnN {.*} {<replacement>} <tl var>`.

**$\TeX$ hackers note:** Exactly two expansions are needed to produce the character.

<code>\c_catcode_active_space_tl</code>	Token list containing one character with category code 13, (“active”), and character code 32 (space).
New: 2017-08-07	

<hr/> <code>\c_catcode_other_space_tl</code> <hr/>	Token list containing one character with category code 12, (“other”), and character code 32 (space).
<hr/> New: 2011-09-05 <hr/>	

## 24.2 Manipulating and interrogating character tokens

<hr/> <code>\char_set_catcode_escape:N</code>	<code>\char_set_catcode_letter:N</code> $\langle character \rangle$
<code>\char_set_catcode_group_begin:N</code>	
<code>\char_set_catcode_group_end:N</code>	
<code>\char_set_catcode_math_toggle:N</code>	
<code>\char_set_catcode_alignment:N</code>	
<code>\char_set_catcode_end_line:N</code>	
<code>\char_set_catcode_parameter:N</code>	
<code>\char_set_catcode_math_superscript:N</code>	
<code>\char_set_catcode_math_subscript:N</code>	
<code>\char_set_catcode_ignore:N</code>	
<code>\char_set_catcode_space:N</code>	
<code>\char_set_catcode_letter:N</code>	
<code>\char_set_catcode_other:N</code>	
<code>\char_set_catcode_active:N</code>	
<code>\char_set_catcode_comment:N</code>	
<code>\char_set_catcode_invalid:N</code>	

---

Updated: 2015-11-11

---

Sets the category code of the  $\langle character \rangle$  to that indicated in the function name. Depending on the current category code of the  $\langle token \rangle$  the escape token may also be needed:

`\char_set_catcode_other:N \%`

The assignment is local.

---

<code>\char_set_catcode_escape:n</code>	<code>\char_set_catcode_letter:n {⟨integer expression⟩}</code>
<code>\char_set_catcode_group_begin:n</code>	
<code>\char_set_catcode_group_end:n</code>	
<code>\char_set_catcode_math_toggle:n</code>	
<code>\char_set_catcode_alignment:n</code>	
<code>\char_set_catcode_end_line:n</code>	
<code>\char_set_catcode_parameter:n</code>	
<code>\char_set_catcode_math_superscript:n</code>	
<code>\char_set_catcode_math_subscript:n</code>	
<code>\char_set_catcode_ignore:n</code>	
<code>\char_set_catcode_space:n</code>	
<code>\char_set_catcode_letter:n</code>	
<code>\char_set_catcode_other:n</code>	
<code>\char_set_catcode_active:n</code>	
<code>\char_set_catcode_comment:n</code>	
<code>\char_set_catcode_invalid:n</code>	

---

Updated: 2015-11-11

---

Sets the category code of the `⟨character⟩` which has character code as given by the `⟨integer expression⟩`. This version can be used to set up characters which cannot otherwise be given (*cf.* the N-type variants). The assignment is local.

---

<code>\char_set_catcode:nn</code>	<code>\char_set_catcode:nn {⟨int expr<sub>1</sub>⟩} {⟨int expr<sub>2</sub>⟩}</code>
-----------------------------------	---

---

Updated: 2015-11-11

---

These functions set the category code of the `⟨character⟩` which has character code as given by the `⟨integer expression⟩`. The first `⟨integer expression⟩` is the character code and the second is the category code to apply. The setting applies within the current  $\text{\TeX}$  group. In general, the symbolic functions `\char_set_catcode_⟨type⟩` should be preferred, but there are cases where these lower-level functions may be useful.

---

<code>\char_value_catcode:n *</code>	<code>\char_value_catcode:n {⟨integer expression⟩}</code>
--------------------------------------	---

---

Expands to the current category code of the `⟨character⟩` with character code given by the `⟨integer expression⟩`.

---

<code>\char_show_value_catcode:n</code>	<code>\char_show_value_catcode:n {⟨integer expression⟩}</code>
---	--

---

Displays the current category code of the `⟨character⟩` with character code given by the `⟨integer expression⟩` on the terminal.

---

<code>\char_set_lccode:nn</code>	<code>\char_set_lccode:nn {⟨int expr<sub>1</sub>⟩} {⟨int expr<sub>2</sub>⟩}</code>
----------------------------------	--

---

Updated: 2015-08-06

---

Sets up the behaviour of the `⟨character⟩` when found inside `\text_lowercase:n`, such that `⟨character1⟩` will be converted into `⟨character2⟩`. The two `⟨characters⟩` may be specified using an `⟨integer expression⟩` for the character code concerned. This may include the  $\text{\TeX}$  ‘`⟨character⟩`’ method for converting a single character into its character code:

```
\char_set_lccode:nn { '\A } { '\a } % Standard behaviour
\char_set_lccode:nn { '\A } { '\A + 32 }
\char_set_lccode:nn { 50 } { 60 }
```

The setting applies within the current  $\text{\TeX}$  group.

<hr/> <hr/>	<hr/>	<hr/>
<code>\char_value_lccode:n</code>	<code>*</code>	<code>\char_value_lccode:n {\langle integer expression \rangle}</code>
		Expands to the current lower case code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ .
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_show_value_lccode:n</code>		<code>\char_show_value_lccode:n {\langle integer expression \rangle}</code>
		Displays the current lower case code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ on the terminal.
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_set_uccode:nn</code>		<code>\char_set_uccode:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}</code>
<hr/>	Updated: 2015-08-06	
		Sets up the behaviour of the $\langle character \rangle$ when found inside <code>\text_uppercase:n</code> , such that $\langle character_1 \rangle$ will be converted into $\langle character_2 \rangle$ . The two $\langle characters \rangle$ may be specified using an $\langle integer expression \rangle$ for the character code concerned. This may include the T <sub>E</sub> X ‘ $\langle character \rangle$ ’ method for converting a single character into its character code:
		<pre> \char_set_uccode:nn { ‘\a } { ‘\A } % Standard behaviour \char_set_uccode:nn { ‘\A } { ‘\A - 32 } \char_set_uccode:nn { 60 } { 50 } </pre>
		The setting applies within the current T <sub>E</sub> X group.
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_value_uccode:n</code>	<code>*</code>	<code>\char_value_uccode:n {\langle integer expression \rangle}</code>
		Expands to the current upper case code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ .
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_show_value_uccode:n</code>		<code>\char_show_value_uccode:n {\langle integer expression \rangle}</code>
		Displays the current upper case code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ on the terminal.
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_set_mathcode:nn</code>		<code>\char_set_mathcode:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}</code>
<hr/>	Updated: 2015-08-06	
		This function sets up the math code of $\langle character \rangle$ . The $\langle character \rangle$ is specified as an $\langle integer expression \rangle$ which will be used as the character code of the relevant character. The setting applies within the current T <sub>E</sub> X group.
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_value_mathcode:n</code>	<code>*</code>	<code>\char_value_mathcode:n {\langle integer expression \rangle}</code>
		Expands to the current math code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ .
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_show_value_mathcode:n</code>		<code>\char_show_value_mathcode:n {\langle integer expression \rangle}</code>
		Displays the current math code of the $\langle character \rangle$ with character code given by the $\langle integer expression \rangle$ on the terminal.
<hr/> <hr/>	<hr/>	<hr/>
<code>\char_set_sfcode:nn</code>		<code>\char_set_sfcode:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}</code>
<hr/>	Updated: 2015-08-06	
		This function sets up the space factor for the $\langle character \rangle$ . The $\langle character \rangle$ is specified as an $\langle integer expression \rangle$ which will be used as the character code of the relevant character. The setting applies within the current T <sub>E</sub> X group.

<hr/> <hr/>	
<code>\char_value_sfcode:n</code> ★	<code>\char_value_sfcode:n {⟨integer expression⟩}</code>
	Expands to the current space factor for the <code>⟨character⟩</code> with character code given by the <code>⟨integer expression⟩</code> .
<hr/> <hr/>	
<code>\char_show_value_sfcode:n</code>	<code>\char_show_value_sfcode:n {⟨integer expression⟩}</code>
	Displays the current space factor for the <code>⟨character⟩</code> with character code given by the <code>⟨integer expression⟩</code> on the terminal.
<hr/> <hr/>	
<code>\l_char_active_seq</code>	Used to track which tokens may require special handling at the document level as they are (or have been at some point) of category <code>⟨active⟩</code> (catcode 13). Each entry in the sequence consists of a single escaped token, for example <code>\~</code> . Active tokens should be added to the sequence when they are defined for general document use.
New: 2012-01-23	
Updated: 2015-11-11	
<hr/> <hr/>	
<code>\l_char_special_seq</code>	Used to track which tokens will require special handling when working with verbatim-like material at the document level as they are not of categories <code>⟨letter⟩</code> (catcode 11) or <code>⟨other⟩</code> (catcode 12). Each entry in the sequence consists of a single escaped token, for example <code>\\</code> for the backslash or <code>\{</code> for an opening brace. Escaped tokens should be added to the sequence when they are defined for general document use.
New: 2012-01-23	
Updated: 2015-11-11	
<hr/> <hr/>	

## 24.3 Generic tokens

<hr/> <hr/>	
<code>\c_group_begin_token</code>	These are implicit tokens which have the category code described by their name. They are used internally for test purposes but are also available to the programmer for other uses.
<code>\c_group_end_token</code>	
<code>\c_math_toggle_token</code>	
<code>\c_alignment_token</code>	
<code>\c_parameter_token</code>	
<code>\c_math_superscript_token</code>	
<code>\c_math_subscript_token</code>	<b>TeXhackers note:</b> The tokens <code>\c_group_begin_token</code> , <code>\c_group_end_token</code> , and <code>\c_space_token</code> are expl3 counterparts of L <sup>A</sup> T <sub>E</sub> X 2 <sub>ε</sub> 's <code>\bgroup</code> , <code>\egroup</code> , and <code>\@sptoken</code> .
<code>\c_space_token</code>	
<hr/> <hr/>	
<code>\c_catcode_letter_token</code>	These are implicit tokens which have the category code described by their name. They are used internally for test purposes and should not be used other than for category code tests.
<code>\c_catcode_other_token</code>	
<hr/> <hr/>	

## 24.4 Converting tokens

---

<code>\token_to_meaning:N</code>	★	<code>\token_to_meaning:N</code>	$\langle token \rangle$
<code>\token_to_meaning:c</code>	★		

---

Inserts the current meaning of the  $\langle token \rangle$  into the input stream as a series of characters of category code 12 (other). This is the primitive  $\text{\TeX}$  description of the  $\langle token \rangle$ , thus for example both functions defined by `\cs_set_nopar:Npn` and token list variables defined using `\tl_new:N` are described as macros.

**$\text{\TeX}$ hackers note:** This is the  $\text{\TeX}$  primitive `\meaning`. The  $\langle token \rangle$  can thus be an explicit space token or an explicit begin-group or end-group character token (`{` or `}` when normal  $\text{\TeX}$  category codes apply) even though these are not valid N-type arguments.

---

<code>\token_to_str:N</code>	★	<code>\token_to_str:N</code>	$\langle token \rangle$
<code>\token_to_str:c</code>	★		

---

Converts the given  $\langle token \rangle$  into a series of characters with category code 12 (other). If the  $\langle token \rangle$  is a control sequence, this will start with the current escape character with category code 12 (the escape character is part of the  $\langle token \rangle$ ). This function requires only a single expansion.

**$\text{\TeX}$ hackers note:** `\token_to_str:N` is the  $\text{\TeX}$  primitive `\string`. The  $\langle token \rangle$  can thus be an explicit space tokens or an explicit begin-group or end-group character token (`{` or `}` when normal  $\text{\TeX}$  category codes apply) even though these are not valid N-type arguments.

---

<code>\token_to_catcode:N</code>	★	<code>\token_to_catcode:N</code>	$\langle token \rangle$
----------------------------------	---	----------------------------------	-------------------------

---

New: 2023-10-15

Converts the given  $\langle token \rangle$  into a number describing its category code. If  $\langle token \rangle$  is a control sequence this expands to 16. This can't detect the categories 0 (escape character), 5 (end of line), 9 (ignored character), 14 (comment character), or 15 (invalid character). Control sequences or active characters let to a token of one of the detectable category codes will yield that category.

## 24.5 Token conditionals

---

<code>\token_if_group_begin_p:N</code>	★	<code>\token_if_group_begin_p:N</code>	$\langle token \rangle$
<code>\token_if_group_begin:NTF</code>	★	<code>\token_if_group_begin:NTF</code>	$\langle token \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$

---

Tests if  $\langle token \rangle$  has the category code of a begin group token (`{` when normal  $\text{\TeX}$  category codes are in force). Note that an explicit begin group token cannot be tested in this way, as it is not a valid N-type argument.

---

<code>\token_if_group_end_p:N</code>	★	<code>\token_if_group_end_p:N</code>	$\langle token \rangle$
<code>\token_if_group_end:NTF</code>	★	<code>\token_if_group_end:NTF</code>	$\langle token \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$

---

Tests if  $\langle token \rangle$  has the category code of an end group token (`}` when normal  $\text{\TeX}$  category codes are in force). Note that an explicit end group token cannot be tested in this way, as it is not a valid N-type argument.

---

```

\token_if_math_toggle_p:N * \token_if_math_toggle_p:N <token>
\token_if_math_toggle:NTF * \token_if_math_toggle:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of a math shift token ( $\$$  when normal T<sub>E</sub>X category codes are in force).

---

```

\token_if_alignment_p:N * \token_if_alignment_p:N <token>
\token_if_alignment:NTF * \token_if_alignment:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of an alignment token ( $\&$  when normal T<sub>E</sub>X category codes are in force).

---

```

\token_if_parameter_p:N * \token_if_parameter_p:N <token>
\token_if_parameter:NTF * \token_if_parameter:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of a macro parameter token ( $\#$  when normal T<sub>E</sub>X category codes are in force).

---

```

\token_if_math_superscript_p:N * \token_if_math_superscript_p:N <token>
\token_if_math_superscript:NTF * \token_if_math_superscript:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of a superscript token ( $\^$  when normal T<sub>E</sub>X category codes are in force).

---

```

\token_if_math_subscript_p:N * \token_if_math_subscript_p:N <token>
\token_if_math_subscript:NTF * \token_if_math_subscript:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of a subscript token ( $\_$  when normal T<sub>E</sub>X category codes are in force).

---

```

\token_if_space_p:N * \token_if_space_p:N <token>
\token_if_space:NTF * \token_if_space:NTF <token> {\true code} {\false code}

```

---

Tests if  $\langle token \rangle$  has the category code of a space token. Note that an explicit space token with character code 32 cannot be tested in this way, as it is not a valid N-type argument.

---

```

\token_if_letter_p:N * \token_if_letter_p:N <token>
\token_if_letter:NTF * \token_if_letter:NTF <token> {\true code} {\false code}

```

---

New: 2020-12-03

---

This function compares the  $\langle test token \rangle$  in turn with each of the  $\langle token case \rangle$ s. If the two are equal (as described for  $\backslash token\_if\_eq\_catcode:Nn\TF$ ,  $\backslash token\_if\_eq\_charcode:Nn\TF$  and  $\backslash token\_if\_eq\_meaning:Nn\TF$ , respectively) then the associated  $\langle code \rangle$  is left in the input stream and other cases are discarded. If any of the cases are matched, the  $\langle true code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false code \rangle$  is inserted. The functions  $\backslash token\_case\_catcode:Nn$ ,  $\backslash token\_case\_charcode:Nn$ , and  $\backslash token\_case\_meaning:Nn$ , which do nothing if there is no match, are also available.

## 24.6 Peeking ahead at the next token

There is often a need to look ahead at the next token in the input stream while leaving it in place. This is handled using the “peek” functions. The generic `\peek_after:Nw` is provided along with a family of predefined tests for common cases. Peeking ahead does *not* skip spaces: rather, `\peek_remove_spaces:n` should be used. In addition, using `\peek_analysis_map_inline:n`, one can map through the following tokens in the input stream and repeatedly perform some tests.

---

`\peek_after:Nw` `\peek_after:Nw`  $\langle function \rangle$   $\langle token \rangle$

---

Locally sets the test variable `\l_peek_token` equal to  $\langle token \rangle$  (as an implicit token, *not* as a token list), and then expands the  $\langle function \rangle$ . The  $\langle token \rangle$  remains in the input stream as the next item after the  $\langle function \rangle$ . The  $\langle token \rangle$  here may be  $\sqcup$ ,  $\{$  or  $\}$  (assuming normal T<sub>E</sub>X category codes), i.e., it is not necessarily the next argument which would be grabbed by a normal function.

---

`\peek_gafter:Nw` `\peek_gafter:Nw`  $\langle function \rangle$   $\langle token \rangle$

---

Globally sets the test variable `\g_peek_token` equal to  $\langle token \rangle$  (as an implicit token, *not* as a token list), and then expands the  $\langle function \rangle$ . The  $\langle token \rangle$  remains in the input stream as the next item after the  $\langle function \rangle$ . The  $\langle token \rangle$  here may be  $\sqcup$ ,  $\{$  or  $\}$  (assuming normal T<sub>E</sub>X category codes), i.e., it is not necessarily the next argument which would be grabbed by a normal function.

---

`\l_peek_token` Token set by `\peek_after:Nw` and available for testing as described above.

---

---

`\g_peek_token` Token set by `\peek_gafter:Nw` and available for testing as described above.

---

---

`\peek_catcode:NTF` `\peek_catcode:NTF`  $\langle test token \rangle$   $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

---

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream has the same category code as the  $\langle test token \rangle$  (as defined by the test `\token_if_eq_catcode:NNTF`). Spaces are respected by the test and the  $\langle token \rangle$  is left in the input stream after the  $\langle true code \rangle$  or  $\langle false code \rangle$  (as appropriate to the result of the test).

---

`\peek_catcode_remove:NTF` `\peek_catcode_remove:NTF`  $\langle test token \rangle$   $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

---

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream has the same category code as the  $\langle test token \rangle$  (as defined by the test `\token_if_eq_catcode:NNTF`). Spaces are respected by the test and the  $\langle token \rangle$  is removed from the input stream if the test is true. The function then places either the  $\langle true code \rangle$  or  $\langle false code \rangle$  in the input stream (as appropriate to the result of the test).

---

`\peek_charcode:NTF` `\peek_charcode:NTF`  $\langle test token \rangle$   $\{\langle true code \rangle\}$   $\{\langle false code \rangle\}$

---

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream has the same character code as the  $\langle test token \rangle$  (as defined by the test `\token_if_eq_charcode:NNTF`). Spaces are respected by the test and the  $\langle token \rangle$  is left in the input stream after the  $\langle true code \rangle$  or  $\langle false code \rangle$  (as appropriate to the result of the test).

<hr/> <u><code>\peek_charcode_remove:NTF</code></u> <hr/>	<code>\peek_charcode_remove:NTF &lt;test token&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
Updated: 2012-12-20	Tests if the next <code>&lt;token&gt;</code> in the input stream has the same character code as the <code>&lt;test token&gt;</code> (as defined by the test <code>\token_if_eq_charcode:NNTF</code> ). Spaces are respected by the test and the <code>&lt;token&gt;</code> is removed from the input stream if the test is true. Updated: 2011-07-02	Tests if the next <code>&lt;token&gt;</code> in the input stream has the same meaning as the <code>&lt;test token&gt;</code> (as defined by the test <code>\token_if_eq_meaning:NNTF</code> ). Spaces are respected by the test and the <code>&lt;token&gt;</code> is left in the input stream after the <code>&lt;true code&gt;</code> or <code>&lt;false code&gt;</code> (as appropriate to the result of the test).
<hr/> <u><code>\peek_meaning_remove:NTF</code></u> <hr/>	<code>\peek_meaning_remove:NTF &lt;test token&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
Updated: 2011-07-02	Tests if the next <code>&lt;token&gt;</code> in the input stream has the same meaning as the <code>&lt;test token&gt;</code> (as defined by the test <code>\token_if_eq_meaning:NNTF</code> ). Spaces are respected by the test and the <code>&lt;token&gt;</code> is removed from the input stream if the test is true. The function then places either the <code>&lt;true code&gt;</code> or <code>&lt;false code&gt;</code> in the input stream (as appropriate to the result of the test).
<hr/> <u><code>\peek_remove_spaces:n</code></u> <hr/>	<code>\peek_remove_spaces:n {&lt;code&gt;}</code>
New: 2018-10-01	Peeks ahead and detect if the following token is a space (category code 10 and character code 32). If so, removes the token and checks the next token. Once a non-space token is found, the <code>&lt;code&gt;</code> will be inserted into the input stream. Typically this will contain a <code>peek</code> operation, but this is not required.
<hr/> <u><code>\peek_remove_filler:n</code></u> <hr/>	<code>\peek_remove_filler:n {&lt;code&gt;}</code>
New: 2022-01-10	Peeks ahead and detect if the following token is a space (category code 10) or has meaning equal to <code>\scan_stop:.</code> . If so, removes the token and checks the next token. If neither of these cases apply, expands the next token using <code>f</code> -type expansion, then checks the resulting leading token in the same way. If after expansion the next token is neither of the two test cases, the <code>&lt;code&gt;</code> will be inserted into the input stream. Typically this will contain a <code>peek</code> operation, but this is not required.

**T<sub>E</sub>Xhackers note:** This is essentially a macro-based implementation of how T<sub>E</sub>X handles the search for a left brace after for example `\everypar`, except that any non-expandable token cleanly ends the `<filler>` (i.e., it does not lead to a T<sub>E</sub>X error).

In contrast to T<sub>E</sub>X's filler removal, a construct `\exp_not:N \foo` will be treated in the same way as `\foo`.

---

`\peek_N_type:TF` `\peek_N_type:TF {⟨true code⟩} {⟨false code⟩}`

---

Updated: 2012-12-20

Tests if the next `⟨token⟩` in the input stream can be safely grabbed as an N-type argument. The test is `⟨false⟩` if the next `⟨token⟩` is either an explicit or implicit begin-group or end-group token (with any character code), or an explicit or implicit space character (with character code 32 and category code 10), or an outer token (never used in L<sup>A</sup>T<sub>E</sub>X3) and `⟨true⟩` in all other cases. Note that a `⟨true⟩` result ensures that the next `⟨token⟩` is a valid N-type argument. However, if the next `⟨token⟩` is for instance `\c_space_token`, the test takes the `⟨false⟩` branch, even though the next `⟨token⟩` is in fact a valid N-type argument. The `⟨token⟩` is left in the input stream after the `⟨true code⟩` or `⟨false code⟩` (as appropriate to the result of the test).

---

`\peek_analysis_map_inline:n` `\peek_analysis_map_inline:n {⟨inline function⟩}`

---

New: 2020-12-03

Updated: 2024-02-07

---

Repeatedly removes one `⟨token⟩` from the input stream and applies the `⟨inline function⟩` to it, until `\peek_analysis_map_break:` is called. The `⟨inline function⟩` receives three arguments for each `⟨token⟩` in the input stream:

- `⟨tokens⟩`, which both o-expand and e/x-expand to the `⟨token⟩`. The detailed form of `⟨tokens⟩` may change in later releases.
- `⟨char code⟩`, a decimal representation of the character code of the `⟨token⟩`, `-1` if it is a control sequence.
- `⟨catcode⟩`, a capital hexadecimal digit which denotes the category code of the `⟨token⟩` (0: control sequence, 1: begin-group, 2: end-group, 3: math shift, 4: alignment tab, 6: parameter, 7: superscript, 8: subscript, A: space, B: letter, C: other, D: active). This can be converted to an integer by writing "`⟨catcode⟩`".

These arguments are the same as for `\tl_analysis_map_inline:nn` defined in `l3tl-analysis`. The `⟨char code⟩` and `⟨catcode⟩` do not take the meaning of a control sequence or active character into account: for instance, upon encountering the token `\c_group_begin_token` in the input stream, `\peek_analysis_map_inline:n` calls the `⟨inline function⟩` with #1 being `\exp_not:n { \c_group_begin_token }` (with the current implementation), #2 being `-1`, and #3 being `0`, as for any other control sequence. In contrast, upon encountering an explicit begin-group token `{`, the `⟨inline function⟩` is called with arguments `\exp_after:wN { \if_false: } \fi:`, `123` and `1`.

The mapping is done at the current group level, i.e., any local assignments made by the `⟨inline function⟩` remain in effect after the loop. Within the code, `\l_peek_token` is set equal (as a token, not a token list) to the token under consideration.

Peek functions cannot be used within this mapping function (nor other mapping functions) since the input stream contains trailing material necessary for the functioning of the loop.

**T<sub>E</sub>Xhackers note:** In case the input stream has not yet been tokenized (converted from characters to tokens), characters are tokenized one by one as needed by `\peek_analysis_map_inline:n` using the current category code régime.

<code>\peek_analysis_map_break:</code>	<code>\peek_analysis_map_inline:n</code>
<code>\peek_analysis_map_break:n</code>	<code>{ ... \peek_analysis_map_break:n {&lt;code&gt;} }</code>
New: 2020-12-03	Stops the <code>\peek_analysis_map_inline:n</code> loop from seeking more tokens, and inserts <code>&lt;code&gt;</code> in the input stream (empty for <code>\peek_analysis_map_break:</code> ).

<code>\peek_regex:nTF</code>	<code>\peek_regex:nTF {&lt;regex&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\peek_regex:NTF</code>	Tests if the <code>&lt;tokens&gt;</code> that follow in the input stream match the <code>&lt;regular expression&gt;</code> . Any <code>&lt;tokens&gt;</code> that have been read are left in the input stream after the <code>&lt;true code&gt;</code> or <code>&lt;false code&gt;</code> (as appropriate to the result of the test). See <code>l3regex</code> for documentation of the syntax of regular expressions. The <code>&lt;regular expression&gt;</code> is implicitly anchored at the start, so for instance <code>\peek_regex:nTF { a }</code> is essentially equivalent to <code>\peek_charcode:NTF a</code> .
New: 2020-12-03	

**T<sub>E</sub>Xhackers note:** Implicit character tokens are correctly considered by `\peek_regex:nTF` as control sequences, while functions that inspect individual tokens (for instance `\peek_charcode:NTF`) only take into account their meaning.

The `\peek_regex:nTF` function only inspects as few tokens as necessary to determine whether the regular expression matches. For instance `\peek_regex:nTF { abc | [a-z] } { } { }` `abc` will only inspect the first token `a` even though the first branch `abc` of the alternative is preferred in functions such as `\peek_regex_remove_once:nTF`. This may have an effect on tokenization if the input stream has not yet been tokenized and category codes are changed.

<code>\peek_regex_remove_once:nTF</code>	<code>\peek_regex_remove_once:nTF {&lt;regex&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\peek_regex_remove_once:NTF</code>	
New: 2020-12-03	Tests if the <code>&lt;tokens&gt;</code> that follow in the input stream match the <code>&lt;regex&gt;</code> . If the test is true, the <code>&lt;tokens&gt;</code> are removed from the input stream and the <code>&lt;true code&gt;</code> is inserted, while if the test is false, the <code>&lt;false code&gt;</code> is inserted followed by the <code>&lt;tokens&gt;</code> that were originally in the input stream. See <code>l3regex</code> for documentation of the syntax of regular expressions. The <code>&lt;regular expression&gt;</code> is implicitly anchored at the start, so for instance <code>\peek_regex_remove_once:nTF { a }</code> is essentially equivalent to <code>\peek_charcode_remove:NTF a</code> .

**T<sub>E</sub>Xhackers note:** Implicit character tokens are correctly considered by `\peek_regex_remove_once:nTF` as control sequences, while functions that inspect individual tokens (for instance `\peek_charcode:NTF`) only take into account their meaning.

---

```

\peek_regex_replace_once:nn    \peek_regex_replace_once:nnTF {\<regex>} {\<replacement>} {\<true code>} {\<false
\peek_regex_replace_once:nnTF code>}
\peek_regex_replace_once:Nn
\peek_regex_replace_once:NnTF

```

---

New: 2020-12-03

If the  $\langle\textit{tokens}\rangle$  that follow in the input stream match the  $\langle\textit{regex}\rangle$ , replaces them according to the  $\langle\textit{replacement}\rangle$  as for `\regex_replace_once:nnN`, and leaves the result in the input stream, after the  $\langle\textit{true code}\rangle$ . Otherwise, leaves  $\langle\textit{false code}\rangle$  followed by the  $\langle\textit{tokens}\rangle$  that were originally in the input stream, with no modifications. See `l3regex` for documentation of the syntax of regular expressions and of the  $\langle\textit{replacement}\rangle$ : for instance `\0` in the  $\langle\textit{replacement}\rangle$  is replaced by the tokens that were matched in the input stream. The  $\langle\textit{regular expression}\rangle$  is implicitly anchored at the start. In contrast to `\regex_replace_once:nnN`, no error arises if the  $\langle\textit{replacement}\rangle$  leads to an unbalanced token list: the tokens are inserted into the input stream without issue.

**TeXhackers note:** Implicit character tokens are correctly considered by `\peek_regex_replace_once:nnTF` as control sequences, while functions that inspect individual tokens (for instance `\peek_charcode:N`) only take into account their meaning.

## 24.7 Description of all possible tokens

Let us end by reviewing every case that a given token can fall into. This section is quite technical and some details are only meant for completeness. We distinguish the meaning of the token, which controls the expansion of the token and its effect on TeX's state, and its shape, which is used when comparing token lists such as for delimited arguments. Two tokens of the same shape must have the same meaning, but the converse does not hold.

A token has one of the following shapes.

- A control sequence, characterized by the sequence of characters that constitute its name: for instance, `\use:n` is a five-letter control sequence.
- An active character token, characterized by its character code (between 0 and 1114111 for LuaTeX and XeTeX and less for other engines) and category code 13.
- A character token, characterized by its character code and category code (one of 1, 2, 3, 4, 6, 7, 8, 10, 11 or 12 whose meaning is described below).

There are also a few internal tokens. The following list may be incomplete in some engines.

- Expanding `\the\font` results in a token that looks identical to the command that was used to select the current font (such as `\tenrm`) but it differs from it in shape.
- A “frozen” `\relax`, which differs from the primitive in shape (but has the same meaning), is inserted when the closing `\fi` of a conditional is encountered before the conditional is evaluated.
- Expanding `\noexpand\<token>` (when the  $\langle\textit{token}\rangle$  is expandable) results in an internal token, displayed (temporarily) as `\notexpanded: \<token>`, whose shape coincides with the  $\langle\textit{token}\rangle$  and whose meaning differs from `\relax`.

- An `\outer endtemplate`: can be encountered when peeking ahead at the next token; this expands to another internal token, `end of alignment template`.
- Tricky programming might access a frozen `\endwrite`.
- Some frozen tokens can only be accessed in interactive sessions: `\cr`, `\right`, `\endgroup`, `\fi`, `\inaccessible`.
- In LuaTeX, there is also the strange case of “bytes” `~~~~~1100xy` where  $x, y$  are any two lowercase hexadecimal digits, so that the hexadecimal number ranges from `"11 0000 = 1 114 112` to `"110 0ff = 1 114 367`. These are used to output individual bytes to files, rather than UTF-8. For the purposes of token comparisons they behave like non-expandable primitive control sequences (*not characters*) whose `\meaning` is `the_ character_` followed by the given byte. If this byte is in the range `80–ff` this gives an “invalid utf-8 sequence” error: applying `\token_to_str:N` or `\token_to_meaning:N` to these tokens is unsafe. Unfortunately, they don’t seem to be detectable safely by any means except perhaps Lua code.

The meaning of a (non-active) character token is fixed by its category code (and character code) and cannot be changed. We call these tokens *explicit* character tokens. Category codes that a character token can have are listed below by giving a sample output of the TeX primitive `\meaning`, together with their L<sup>A</sup>T<sub>E</sub>X3 names and most common example:

- 1 begin-group character (`group_begin`, often `{`),
- 2 end-group character (`group_end`, often `}`),
- 3 math shift character (`math_toggle`, often `$`),
- 4 alignment tab character (`alignment`, often `&`),
- 6 macro parameter character (`parameter`, often `#`),
- 7 superscript character (`math_superscript`, often `^`),
- 8 subscript character (`math_subscript`, often `_`),
- 10 blank space (`space`, often character code 32),
- 11 the letter (`letter`, such as `A`),
- 12 the character (`other`, such as `0`).

Category code 13 (*active*) is discussed below. Input characters can also have several other category codes which do not lead to character tokens for later processing: 0 (`escape`), 5 (`end_line`), 9 (`ignore`), 14 (`comment`), and 15 (`invalid`).

The meaning of a control sequence or active character can be identical to that of any character token listed above (with any character code), and we call such tokens *implicit* character tokens. The meaning is otherwise in the following list:

- a macro, used in L<sup>A</sup>T<sub>E</sub>X3 for most functions and some variables (`t1`, `fp`, `seq`, ...),
- a primitive such as `\def` or `\topmark`, used in L<sup>A</sup>T<sub>E</sub>X3 for some functions,
- a register such as `\count123`, used in L<sup>A</sup>T<sub>E</sub>X3 for the implementation of some variables (`int`, `dim`, ...),

- a constant integer such as `\char"56` or `\mathchar"121`,
- a font selection command,
- undefined.

Macros can be `\protected` or not, `\long` or not (the opposite of what L<sup>A</sup>T<sub>E</sub>X3 calls `nopar`), and `\outer` or not (unused in L<sup>A</sup>T<sub>E</sub>X3). Their `\meaning` takes the form

`⟨prefix⟩ macro:⟨argument⟩->⟨replacement⟩`

where `⟨prefix⟩` is among `\protected\long\outer`, `⟨argument⟩` describes parameters that the macro expects, such as `#1#2#3`, and `⟨replacement⟩` describes how the parameters are manipulated, such as `\int_eval:n{#2+#1*#3}`.

Now is perhaps a good time to mention some subtleties relating to tokens with category code 10 (space). Any input character with this category code (normally, space and tab characters) becomes a normal space, with character code 32 and category code 10.

When a macro takes an undelimited argument, explicit space characters (with character code 32 and category code 10) are ignored. If the following token is an explicit character token with category code 1 (begin-group) and an arbitrary character code, then T<sub>E</sub>X scans ahead to obtain an equal number of explicit character tokens with category code 1 (begin-group) and 2 (end-group), and the resulting list of tokens (with outer braces removed) becomes the argument. Otherwise, a single token is taken as the argument for the macro: we call such single tokens “N-type”, as they are suitable to be used as an argument for a function with the signature `:N`.

When a macro takes a delimited argument T<sub>E</sub>X scans ahead until finding the delimiter (outside any pairs of begin-group/end-group explicit characters), and the resulting list of tokens (with outer braces removed) becomes the argument. Note that explicit space characters at the start of the argument are *not* ignored in this case (and they prevent brace-stripping).

## Chapter 25

# The l3prop module

## Property lists

expl3 implements a “property list” data type, which contain an unordered list of entries each of which consists of a  $\langle key \rangle$  (string) and an associated  $\langle value \rangle$  (token list). The  $\langle key \rangle$  and  $\langle value \rangle$  may both be given as any balanced text, and the  $\langle key \rangle$  is processed using `\tl_to_str:n`, meaning that category codes are ignored. Entries can be manipulated individually, as well as collectively by applying a function to every key–value pair within the list.

Each entry in a property list must have a unique  $\langle key \rangle$ : if an entry is added to a property list which already contains the  $\langle key \rangle$  then the new entry overwrites the existing one. The  $\langle keys \rangle$  are compared on a string basis, using the same method as `\str_if_eq:nnTF`.

Property lists are intended for storing key-based information for use within code. They can be converted from and to key–value lists, which are a form of *input* parsed by the `l3keys` module. If a key–value list contains a  $\langle key \rangle$  multiple times, only the last  $\langle value \rangle$  associated to it will be kept in the conversion to a property list.

Internally, property lists can use two distinct implementations with different data storage, which are decided when declaring the property list variable using `\prop_new:N` (“flat” storage) or `\prop_new_linked:N` (“linked” storage). After a property list is declared with `\prop_new:N` or `\prop_new_linked:N`, the type of internal data storage can be changed by `\prop_make_flat:N` or `\prop_make_linked:N`, but only at the outermost group level. All other `l3prop` functions transparently manipulate either storage method and convert as needed.

- The (default) “flat” storage method is suited for a relatively small number of entries, or when the property list is likely to be manipulated (copied, mapped) as a whole rather than entry-wise. It is significantly faster for `\prop_set_eq:NN`, and only slightly faster for `\prop_clear:N`, `\prop_concat:NNN`, and mapping functions `\prop_map_....`
- The “linked” storage method is meant for property lists with a large numbers of entries. It takes up more of TeX’s memory during a run, but is significantly faster (for long lists) when accessing or modifying individual entries using functions such as `\prop_if_in:Nn`, `\prop_item:Nn`, `\prop_put:Nnn`, `\prop_get:NnN`, `\prop_pop:NnN`, `\prop_remove:Nn`, as it takes a constant time for these operations (rather

than the number of items for a “flat” property list). A technical drawback is that memory is permanently used<sup>7</sup> by  $\langle\text{keys}\rangle$  stored in a “linked” property list, even after they are removed and the property list is deleted.

## 25.1 Creating and initialising property lists

---

$\backslash\text{prop\_new:N}$	$\backslash\text{prop\_new:N}$ $\langle\text{property list}\rangle$
$\backslash\text{prop\_new:c}$	Creates a new “flat” $\langle\text{property list}\rangle$ or raises an error if the name is already taken. The declaration is global. The $\langle\text{property list}\rangle$ initially contains no entries. See also $\backslash\text{prop\_new\_linked:N}$ .

---

---

$\backslash\text{prop\_new\_linked:N}$	$\backslash\text{prop\_new\_linked:N}$ $\langle\text{property list}\rangle$
$\backslash\text{prop\_new\_linked:c}$	Creates a new “linked” $\langle\text{property list}\rangle$ or raises an error if the name is already taken. The declaration is global. The $\langle\text{property list}\rangle$ initially contains no entries. The internal data storage differs from that produced by $\backslash\text{prop\_new:N}$ and it is optimized for property lists with a large number of entries.

---

New: 2024-02-12

---

$\backslash\text{prop\_clear:N}$	$\backslash\text{prop\_clear:N}$ $\langle\text{property list}\rangle$
$\backslash\text{prop\_clear:c}$	
$\backslash\text{prop\_gclear:N}$	Clears all entries from the $\langle\text{property list}\rangle$ .
$\backslash\text{prop\_gclear:c}$	

---

---

$\backslash\text{prop\_clear\_new:N}$	$\backslash\text{prop\_clear\_new:N}$ $\langle\text{property list}\rangle$
$\backslash\text{prop\_clear\_new:c}$	
$\backslash\text{prop\_gclear\_new:N}$	Ensures that the $\langle\text{property list}\rangle$ exists globally by applying $\backslash\text{prop\_new:N}$ if necessary, then applies $\backslash\text{prop\_}(g)\text{clear:N}$ to leave the list empty.
$\backslash\text{prop\_gclear\_new:c}$	

---

**T<sub>E</sub>Xhackers note:** If the property list exists and is of “linked” type, it is cleared but not made into a flat property list.

---

$\backslash\text{prop\_clear\_new\_linked:N}$	$\backslash\text{prop\_clear\_new\_linked:N}$ $\langle\text{property list}\rangle$
$\backslash\text{prop\_clear\_new\_linked:c}$	
$\backslash\text{prop\_gclear\_new\_linked:N}$	Ensures that the $\langle\text{property list}\rangle$ exists globally by applying $\backslash\text{prop\_new\_linked:N}$ if necessary, then applies $\backslash\text{prop\_}(g)\text{clear:N}$ to leave the list empty.
$\backslash\text{prop\_gclear\_new\_linked:c}$	

---

New: 2024-02-12

**T<sub>E</sub>Xhackers note:** If the property list exists and is of “flat” type, it is cleared but not made into a linked property list.

---

$\backslash\text{prop\_set\_eq:NN}$	$\backslash\text{prop\_set\_eq:NN}$ $\langle\text{property list}_1\rangle$ $\langle\text{property list}_2\rangle$
$\backslash\text{prop\_set\_eq:(cN Nc cc)}$	
$\backslash\text{prop\_gset\_eq:NN}$	Sets the content of $\langle\text{property list}_1\rangle$ equal to that of $\langle\text{property list}_2\rangle$ . This converts as needed between the two storage types.
$\backslash\text{prop\_gset\_eq:(cN Nc cc)}$	

---

<sup>7</sup>Until the end of the run, that is.

---

<code>\prop_set_from_keyval:Nn</code>	<code>\prop_set_from_keyval:Nn</code> $\langle\textit{property list}\rangle$
<code>\prop_set_from_keyval:cn</code>	{
<code>\prop_gset_from_keyval:Nn</code>	$\langle\textit{key}_1\rangle = \langle\textit{value}_1\rangle$ ,
<code>\prop_gset_from_keyval:cn</code>	$\langle\textit{key}_2\rangle = \langle\textit{value}_2\rangle$ , ...
	}

---

New: 2017-11-28  
Updated: 2021-11-07

Sets  $\langle\textit{property list}\rangle$  to contain key–value pairs given in the second argument. If duplicate keys appear only the last of the values is kept. In contrast to most keyval lists (*e.g.* those in `l3keys`), each key here *must* be followed with an = sign even to specify an empty  $\langle\textit{value}\rangle$ .

Spaces are trimmed around every  $\langle\textit{key}\rangle$  and every  $\langle\textit{value}\rangle$ , and if the result of trimming spaces consists of a single brace group then a set of outer braces is removed. This enables both the  $\langle\textit{key}\rangle$  and the  $\langle\textit{value}\rangle$  to contain spaces, commas or equal signs. The  $\langle\textit{key}\rangle$  is then processed by `\tl_to_str:n`. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

---

<code>\prop_const_from_keyval:Nn</code>	<code>\prop_const_from_keyval:Nn</code> $\langle\textit{property list}\rangle$
<code>\prop_const_from_keyval:cn</code>	{
	$\langle\textit{key}_1\rangle = \langle\textit{value}_1\rangle$ ,
	$\langle\textit{key}_2\rangle = \langle\textit{value}_2\rangle$ , ...
	}

---

New: 2017-11-28  
Updated: 2021-11-07

Creates a new constant “flat”  $\langle\textit{property list}\rangle$  or raises an error if the name is already taken. The  $\langle\textit{property list}\rangle$  is set globally to contain key–value pairs given in the second argument, processed in the way described for `\prop_set_from_keyval:Nn`. If duplicate keys appear only the last of the values is kept. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

---

<code>\prop_const_linked_from_keyval:Nn</code>	<code>\prop_const_linked_from_keyval:Nn</code> $\langle\textit{property list}\rangle$
<code>\prop_const_linked_from_keyval:cn</code>	{
	$\langle\textit{key}_1\rangle = \langle\textit{value}_1\rangle$ ,
	$\langle\textit{key}_2\rangle = \langle\textit{value}_2\rangle$ , ...
	}

---

New: 2024-02-12

Creates a new constant “linked”  $\langle\textit{property list}\rangle$  or raises an error if the name is already taken. The  $\langle\textit{property list}\rangle$  is set globally to contain key–value pairs given in the second argument, processed in the way described for `\prop_set_from_keyval:Nn`. If duplicate keys appear only the last of the values is kept. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

---

<code>\prop_make_flat:N</code>	<code>\prop_make_flat:N</code> $\langle\textit{property list}\rangle$
<code>\prop_make_flat:c</code>	

---

New: 2024-02-12

Changes the internal storage type of the  $\langle\textit{property list}\rangle$  to be the same “flat” storage as `\prop_new:N`. The key–value pairs of the  $\langle\textit{property list}\rangle$  are preserved by the change. If the property list was already flat then nothing is done. This function can only be used at the outermost group level.

---

<code>\prop_make_linked:N</code>	<code>\prop_make_linked:N</code> $\langle\textit{property list}\rangle$
<code>\prop_make_linked:c</code>	

---

New: 2024-02-12

Changes the internal storage type of the  $\langle\textit{property list}\rangle$  to be the same “linked” storage as `\prop_new_linked:N`. The key–value pairs of the  $\langle\textit{property list}\rangle$  are preserved by the change. If the property list was already linked then nothing is done. This function can only be used at the outermost group level.

## 25.2 Adding and updating property list entries

<code>\prop_put:Nnn</code>	<code>\prop_put:Nnn &lt;property list&gt; {&lt;key&gt;} {&lt;value&gt;}</code>
<code>\prop_put:(NnV Nnv Nne NVn NVV NVv Nve Nvn NvV Nvv Nve Nen NeV Nev Nee Nno Non Noo cnn cnV cnv cne cVn cVV cVv cVe cvn cvV cvv cve cen ceV cev cee cno con coo)</code>	
<code>\prop_gput:Nnn</code>	
<code>\prop_gput:(NnV Nnv Nne NVn NVV NVv Nve Nvn NvV Nvv Nve Nen NeV Nev Nee Nno Non Noo cnn cnV cnv cne cVn cVV cVv cVe cvn cvV cvv cve cen ceV cev cee cno con coo)</code>	
Updated: 2012-07-09	

Adds an entry to the `<property list>` which may be accessed using the `<key>` and which has `<value>`. If the `<key>` is already present in the `<property list>`, the existing entry is overwritten by the new `<value>`. Both the `<key>` and `<value>` may contain any *balanced text*. The `<key>` is stored after processing with `\tl_to_str:n`, meaning that category codes are ignored.

<code>\prop_put_if_not_in:Nnn</code>	<code>\prop_put_if_not_in:Nnn &lt;property list&gt; {&lt;key&gt;} {&lt;value&gt;}</code>
<code>\prop_put_if_not_in:(NnV Nnv Nne NVn NVV NVv Nve Nvn NvV Nvv Nve Nen NeV Nev Nee cnn cnV cnv cne cVn cVV cVv cVe cvn cvV cvv cve cen ceV cev cee)</code>	
<code>\prop_gput_if_not_in:Nnn</code>	
<code>\prop_gput_if_not_in:(NnV Nnv Nne NVn NVV NVv Nve Nvn NvV Nvv Nve Nen NeV Nev Nee cnn cnV cnv cne cVn cVV cVv cVe cvn cvV cvv cve cen ceV cev cee)</code>	
New: 2024-03-30	
Updated: 2024-05-07	

If the `<key>` is present in the `<property list>` then no action is taken. Otherwise, a new entry is added as described for `\prop_put:Nnn`.

<code>\prop_concat:NNN</code>	<code>\prop_concat:NNN</code> $\langle\textit{property list}_1\rangle$ $\langle\textit{property list}_2\rangle$ $\langle\textit{property list}_3\rangle$
<code>\prop_concat:ccc</code>	Combines the key–value pairs of $\langle\textit{property list}_2\rangle$ and $\langle\textit{property list}_3\rangle$ , and saves the result in $\langle\textit{property list}_1\rangle$ . If a key appears in both $\langle\textit{property list}_2\rangle$ and $\langle\textit{property list}_3\rangle$ then the last value, namely the value in $\langle\textit{property list}_3\rangle$ is kept. This converts as needed between the two storage types.
<code>\prop_gconcat:NNN</code>	
<code>\prop_gconcat:ccc</code>	
New: 2021-05-16	

---

<code>\prop_put_from_keyval:Nn</code>	<code>\prop_put_from_keyval:Nn &lt;property list&gt;</code>
<code>\prop_put_from_keyval:cn</code>	{
<code>\prop_gput_from_keyval:Nn</code>	<code>&lt;key<sub>1</sub>&gt; = &lt;value<sub>1</sub>&gt; ,</code>
<code>\prop_gput_from_keyval:cn</code>	<code>&lt;key<sub>2</sub>&gt; = &lt;value<sub>2</sub>&gt; , ...</code>
	}

---

New: 2021-05-16  
Updated: 2021-11-07

Updates the `<property list>` by adding entries for each key–value pair given in the second argument. The addition is done through `\prop_put:Nnn`, hence if the `<property list>` already contains some of the keys, the corresponding values are discarded and replaced by those given in the key–value list. If duplicate keys appear in the key–value list then only the last of the values is kept.

The function is equivalent to storing the key–value pairs in a temporary property list using `\prop_set_from_keyval:Nn`, then combining `<property list>` with the temporary variable using `\prop_concat:NNN`. In particular, the `<keys>` and `<values>` are space-trimmed and unbraced as described in `\prop_set_from_keyval:Nn`. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

## 25.3 Recovering values from property lists

---

<code>\prop_get:NnN</code>	<code>\prop_get:NnN &lt;property list&gt; {&lt;key&gt;} &lt;t1 var&gt;</code>
<code>\prop_get:(NVN NvN NeN NoN cnN cVN cvN ceN coN cnc)</code>	

---

Updated: 2011-08-28

Recovers the `<value>` stored with `<key>` from the `<property list>`, and places this in the `<t1 var>`. If the `<key>` is not found in the `<property list>` then the `<t1 var>` is set to the special marker `\q_no_value`. The `<t1 var>` is set within the current  $\TeX$  group. See also `\prop_get:NnNTF`.

---

<code>\prop_pop:NnN</code>	<code>\prop_pop:NnN &lt;property list&gt; {&lt;key&gt;} &lt;t1 var&gt;</code>
<code>\prop_pop:(NVN NoN cnN cVN coN)</code>	

---

Updated: 2011-08-18

Recovers the `<value>` stored with `<key>` from the `<property list>`, and places this in the `<t1 var>`. If the `<key>` is not found in the `<property list>` then the `<t1 var>` is set to the special marker `\q_no_value`. The `<key>` and `<value>` are then deleted from the property list. Both assignments are local. See also `\prop_pop:NnNTF`.

---

<code>\prop_gpop:NnN</code>	<code>\prop_gpop:NnN &lt;property list&gt; {&lt;key&gt;} &lt;t1 var&gt;</code>
<code>\prop_gpop:(NVN NoN cnN cVN coN)</code>	

---

Updated: 2011-08-18

Recovers the `<value>` stored with `<key>` from the `<property list>`, and places this in the `<t1 var>`. If the `<key>` is not found in the `<property list>` then the `<t1 var>` is set to the special marker `\q_no_value`. The `<key>` and `<value>` are then deleted from the property list. The `<property list>` is modified globally, while the assignment of the `<t1 var>` is local. See also `\prop_gpop:NnNTF`.

---

<code>\prop_item:Nn</code>	<code>*</code>	<code>\prop_item:Nn &lt;property list&gt; {&lt;key&gt;}</code>
<code>\prop_item:(NV Ne No cn cV ce co)</code>	<code>*</code>	

---

New: 2014-07-17

---

Expands to the  $\langle value \rangle$  corresponding to the  $\langle key \rangle$  in the  $\langle property list \rangle$ . If the  $\langle key \rangle$  is missing, this has an empty expansion.

**TeXhackers note:** For “flat” property lists, this expandable function iterates through every key–value pair and is therefore slower than a non-expandable approach based on `\prop_get:NnN`. (For “linked” property lists both functions are fast.)

The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the  $\langle value \rangle$  does not expand further when appearing in an **e**-type or **x**-type argument expansion.

---

<code>\prop_count:N</code>	<code>*</code>	<code>\prop_count:N &lt;property list&gt;</code>
<code>\prop_count:c</code>	<code>*</code>	

---

Leaves the number of key–value pairs in the  $\langle property list \rangle$  in the input stream as an  $\langle integer denotation \rangle$ .

---

<code>\prop_to_keyval:N</code>	<code>*</code>	<code>\prop_to_keyval:N &lt;property list&gt;</code>
--------------------------------	----------------	--

---

Expands to the  $\langle property list \rangle$  in a key–value notation. Keep in mind that a  $\langle property list \rangle$  is *unordered*, while key–value interfaces are not necessarily, so this cannot be used for arbitrary interfaces.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the key–value list does not expand further when appearing in an **e**-type or **x**-type argument expansion. It also needs exactly two steps of expansion.

## 25.4 Modifying property lists

---

<code>\prop_remove:Nn</code>	<code>\prop_remove:Nn &lt;property list&gt; {&lt;key&gt;}</code>
<code>\prop_remove:(NV Ne cn cV ce)</code>	
<code>\prop_gremove:Nn</code>	
<code>\prop_gremove:(NV Ne cn cV ce)</code>	

---

New: 2012-05-12

---

Removes the entry listed under  $\langle key \rangle$  from the  $\langle property list \rangle$ . If the  $\langle key \rangle$  is not found in the  $\langle property list \rangle$  no change occurs, *i.e.* there is no need to test for the existence of a key before deleting it.

## 25.5 Property list conditionals

---

<code>\prop_if_exist_p:N</code>	<code>*</code>	<code>\prop_if_exist_p:N &lt;property list&gt;</code>
<code>\prop_if_exist_p:c</code>	<code>*</code>	<code>\prop_if_exist:NTF &lt;property list&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\prop_if_exist:NTF</code>	<code>*</code>	Tests whether the $\langle property list \rangle$ is currently defined. This does not check that the
<code>\prop_if_exist:cTF</code>	<code>*</code>	$\langle property list \rangle$ really is a property list variable.

---

New: 2012-03-03

---

---

```

\prop_if_empty_p:N * \prop_if_empty_p:N <property list>
\prop_if_empty_p:c * \prop_if_empty:NTF <property list> {\true code} {\false code}
\prop_if_empty:N\TF * Tests if the <property list> is empty (containing no entries).
\prop_if_empty:c\TF *

```

---

---

```

\prop_if_in_p:Nn * \prop_if_in_p:Nn <property list> {\key}
\prop_if_in_p:(NV|Ne|No|cn|cV|ce|co) * \prop_if_in:NnNTF <property list> {\key} {\true code} {\false code}
\prop_if_in:Nn\TF *
\prop_if_in:(NV|Ne|No|cn|cV|ce|co)\TF *

```

---

Updated: 2011-09-15

---

Tests if the  $\langle key \rangle$  is present in the  $\langle property list \rangle$ , making the comparison using the method described by `\str_if_eq:nnTF`.

**T<sub>E</sub>Xhackers note:** For “flat” property lists, this expandable function iterates through every key–value pair and is therefore slower than a non-expandable approach based on `\prop_get:NnNTF`. (For “linked” property lists both functions are fast.)

## 25.6 Recovering values from property lists with branching

The functions in this section combine tests for the presence of a key in a property list with recovery of the associated valued. This makes them useful for cases where different code follows depending on the presence or absence of a key in a property list. They offer increased readability and performance over separate testing and recovery phases.

---

```

\prop_get:Nn\TF * \prop_get:NnNTF <property list> {\key} <t1 var>
\prop_get:(NVN|NvN|NeN|NoN|cnN|cVN|cvN|ceN|coN|cnc)\TF * {\true code} {\false code}

```

---

Updated: 2012-05-19

---

If the  $\langle key \rangle$  is not present in the  $\langle property list \rangle$ , leaves the  $\langle false code \rangle$  in the input stream. The value of the  $\langle t1 var \rangle$  is not defined in this case and should not be relied upon. If the  $\langle key \rangle$  is present in the  $\langle property list \rangle$ , stores the corresponding  $\langle value \rangle$  in the  $\langle t1 var \rangle$  without removing it from the  $\langle property list \rangle$ , then leaves the  $\langle true code \rangle$  in the input stream. The  $\langle t1 var \rangle$  is assigned locally.

---

```

\prop_pop:Nn\TF * \prop_pop:NnNTF <property list> {\key} <t1 var>
\prop_pop:(NVN|NoN|cnN|cVN|coN)\TF * {\true code} {\false code}

```

---

Updated: 2012-05-19

---

If the  $\langle key \rangle$  is not present in the  $\langle property list \rangle$ , leaves the  $\langle false code \rangle$  in the input stream. The value of the  $\langle t1 var \rangle$  is not defined in this case and should not be relied upon. If the  $\langle key \rangle$  is present in the  $\langle property list \rangle$ , pops the corresponding  $\langle value \rangle$  in the  $\langle t1 var \rangle$ , i.e., removes the item from the  $\langle property list \rangle$ . Both the  $\langle property list \rangle$  and the  $\langle t1 var \rangle$  are assigned locally.

---

<code>\prop_gpop:NnTF</code>	<code>\prop_gpop:NnTF &lt;property list&gt; {&lt;key&gt;} &lt;tl var&gt;</code>
<code>\prop_gpop:(NVN NoN cnN cVN coN)TF</code>	<code>{&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2011-08-18

Updated: 2012-05-19

---

If the `<key>` is not present in the `<property list>`, leaves the `<false code>` in the input stream. The value of the `<tl var>` is not defined in this case and should not be relied upon. If the `<key>` is present in the `<property list>`, pops the corresponding `<value>` in the `<tl var>`, i.e., removes the item from the `<property list>`. The `<property list>` is modified globally, while the `<tl var>` is assigned locally.

## 25.7 Mapping over property lists

All mappings are done at the current group level, i.e., any local assignments made by the `<function>` or `<code>` discussed below remain in effect after the loop.

---

<code>\prop_map_function:Nn</code> ☆	<code>\prop_map_function:Nn &lt;property list&gt; &lt;function&gt;</code>
--------------------------------------	---

---

<code>\prop_map_function:cN</code> ☆
--------------------------------------

---

Updated: 2013-01-08

---

Applies `<function>` to every `<entry>` stored in the `<property list>`. The `<function>` receives two arguments for each iteration: the `<key>` and associated `<value>`. The order in which `<entries>` are returned is not defined and should not be relied upon. To pass further arguments to the `<function>`, see `\prop_map_inline:Nn` (non-expandable) or `\prop_map_tokens:Nn`.

---

<code>\prop_map_inline:Nn</code>	<code>\prop_map_inline:Nn &lt;property list&gt; {&lt;inline function&gt;}</code>
----------------------------------	--

---

<code>\prop_map_inline:cN</code>
----------------------------------

---

Updated: 2013-01-08

---

Applies `<inline function>` to every `<entry>` stored within the `<property list>`. The `<inline function>` should consist of code which receives the `<key>` as #1 and the `<value>` as #2. The order in which `<entries>` are returned is not defined and should not be relied upon.

---

<code>\prop_map_tokens:Nn</code> ☆	<code>\prop_map_tokens:Nn &lt;property list&gt; {&lt;code&gt;}</code>
------------------------------------	---

---

<code>\prop_map_tokens:cN</code> ☆
------------------------------------

---

Analogue of `\prop_map_function:Nn` which maps several tokens instead of a single function. The `<code>` receives each key-value pair in the `<property list>` as two trailing brace groups. For instance,

`\prop_map_tokens:Nn \l_my_prop { \str_if_eq:nnT { mykey } }`

expands to the value corresponding to `mykey`: for each pair in `\l_my_prop` the function `\str_if_eq:nnT` receives `mykey`, the `<key>` and the `<value>` as its three arguments. For that specific task, `\prop_item:Nn` is faster.

---

<code>\prop_map_break:</code> ☆	<code>\prop_map_break:</code>
Updated: 2012-06-29	Used to terminate a <code>\prop_map...</code> function before all entries in the <i>⟨property list⟩</i> have been processed. This normally takes place within a conditional statement, for example

---

```

\prop_map_inline:Nn \l_my_prop
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \prop_map_break: }
  {
    % Do something useful
  }
}

```

Use outside of a `\prop_map...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

<code>\prop_map_break:n</code> ☆	<code>\prop_map_break:n {⟨code⟩}</code>
Updated: 2012-06-29	Used to terminate a <code>\prop_map...</code> function before all entries in the <i>⟨property list⟩</i> have been processed, inserting the <i>⟨code⟩</i> after the mapping has ended. This normally takes place within a conditional statement, for example

---

```

\prop_map_inline:Nn \l_my_prop
{
  \str_if_eq:nnTF { #1 } { bingo }
  { \prop_map_break:n { <code> } }
  {
    % Do something useful
  }
}

```

Use outside of a `\prop_map...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before the *⟨code⟩* is inserted into the input stream. This depends on the design of the mapping function.

## 25.8 Viewing property lists

---

<code>\prop_show:N</code>	<code>\prop_show:N ⟨property list⟩</code>
<code>\prop_show:c</code>	Displays the entries in the <i>⟨property list⟩</i> in the terminal, and specifies its storage type.
Updated: 2021-04-29	

---

---

<code>\prop_log:N</code>	<code>\prop_log:N</code> $\langle$ <i>property list</i> $\rangle$
<code>\prop_log:c</code>	Writes the entries in the $\langle$ <i>property list</i> $\rangle$ in the log file, and specifies its storage type.
New: 2014-08-12	
Updated: 2021-04-29	

---

## 25.9 Scratch property lists

There is no need to include both flat and linked property lists as scratch variables. We arbitrarily pick the older implementation.

---

<code>\l_tmpa_prop</code>	Scratch “flat” property lists for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_prop</code>	
New: 2012-06-23	

---

---

<code>\g_tmpa_prop</code>	Scratch “flat” property lists for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_prop</code>	
New: 2012-06-23	

---

## 25.10 Constants

---

<code>\c_empty_prop</code>	A permanently-empty property list used for internal comparisons.
----------------------------	--

---

## Chapter 26

# The l3skip module

## Dimensions and skips

L<sup>A</sup>T<sub>E</sub>X3 provides two general length variables: `dim` and `skip`. Lengths stored as `dim` variables have a fixed length, whereas `skip` lengths have a rubber (stretch/shrink) component. In addition, the `muskip` type is available for use in math mode: this is a special form of `skip` where the lengths involved are determined by the current math font (in  $\mu$ ). There are common features in the creation and setting of length variables, but for clarity the functions are grouped by variable type.

Many functions take *dimension expressions* (“`<dim expr>`”) or *skip expressions* (“`<skip expr>`”) as arguments.

### 26.1 Creating and initialising dim variables

---

<code>\dim_new:N</code>	<code>\dim_new:N &lt;dimension&gt;</code>
-------------------------	---

---

<code>\dim_new:c</code>	
-------------------------	--

Creates a new `<dimension>` or raises an error if the name is already taken. The declaration is global. The `<dimension>` is initially equal to 0pt.

---

<code>\dim_const:Nn</code>	<code>\dim_const:Nn &lt;dimension&gt; {&lt;dim expr&gt;}</code>
----------------------------	---

---

<code>\dim_const:cn</code>	
----------------------------	--

Creates a new constant `<dimension>` or raises an error if the name is already taken. The value of the `<dimension>` is set globally to the `<dim expr>`.

---

New: 2012-03-05	
-----------------	--

---

---

<code>\dim_zero:N</code>	<code>\dim_zero:N &lt;dimension&gt;</code>
--------------------------	--

---

<code>\dim_zero:c</code>	
--------------------------	--

Sets `<dimension>` to 0pt.

---

<code>\dim_gzero:N</code>	
---------------------------	--

---

<code>\dim_gzero:c</code>	
---------------------------	--

---

---

<code>\dim_zero_new:N</code>	<code>\dim_zero_new:N &lt;dimension&gt;</code>
------------------------------	--

---

<code>\dim_zero_new:c</code>	
------------------------------	--

---

<code>\dim_gzero_new:N</code>	
-------------------------------	--

---

<code>\dim_gzero_new:c</code>	
-------------------------------	--

---

Ensures that the `<dimension>` exists globally by applying `\dim_new:N` if necessary, then applies `\dim_(g)zero:N` to leave the `<dimension>` set to zero.

---

New: 2012-01-07

## 26.2 Setting dim variables

---

<code>\dim_add:Nn</code>	<code>\dim_add:Nn</code>	$\langle dimension \rangle$ $\{\langle dim\ expr \rangle\}$
<code>\dim_add:cn</code>	Adds the result of the $\langle dim\ expr \rangle$ to the current content of the $\langle dimension \rangle$ .	
<code>\dim_gadd:Nn</code>		
<code>\dim_gadd:cn</code>		

---

Updated: 2011-10-22

---

---

<code>\dim_set:Nn</code>	<code>\dim_set:Nn</code>	$\langle dimension \rangle$ $\{\langle dim\ expr \rangle\}$
<code>\dim_set:(cn NV cV)</code>	Sets $\langle dimension \rangle$ to the value of $\langle dim\ expr \rangle$ , which must evaluate to a length with units.	
<code>\dim_gset:Nn</code>		
<code>\dim_gset:(cn NV cV)</code>		

---

Updated: 2011-10-22

---

---

<code>\dim_set_eq:NN</code>	<code>\dim_set_eq:NN</code>	$\langle dimension_1 \rangle$ $\langle dimension_2 \rangle$
<code>\dim_set_eq:(cN Nc cc)</code>	Sets the content of $\langle dimension_1 \rangle$ equal to that of $\langle dimension_2 \rangle$ .	
<code>\dim_gset_eq:NN</code>		
<code>\dim_gset_eq:(cN Nc cc)</code>		

---

---

<code>\dim_sub:Nn</code>	<code>\dim_sub:Nn</code>	$\langle dimension \rangle$ $\{\langle dim\ expr \rangle\}$
<code>\dim_sub:cn</code>	Subtracts the result of the $\langle dim\ expr \rangle$ from the current content of the $\langle dimension \rangle$ .	
<code>\dim_gsub:Nn</code>		
<code>\dim_gsub:cn</code>		

---

Updated: 2011-10-22

---

## 26.3 Utilities for dimension calculations

---

<code>\dim_abs:n</code>	★	<code>\dim_abs:n</code>	$\{\langle dim\ expr \rangle\}$
-------------------------	---	-------------------------	---------------------------------

---

Updated: 2012-09-26

---

Converts the  $\langle dim\ expr \rangle$  to its absolute value, leaving the result in the input stream as a  $\langle dimension\ denotation \rangle$ .

---

<code>\dim_max:nn</code>	★	<code>\dim_max:nn</code>	$\{\langle dim\ expr_1 \rangle\}$ $\{\langle dim\ expr_2 \rangle\}$
<code>\dim_min:nn</code>	★	<code>\dim_min:nn</code>	$\{\langle dim\ expr_1 \rangle\}$ $\{\langle dim\ expr_2 \rangle\}$

---

New: 2012-09-09

---

Evaluates the two  $\langle dim\ exprs \rangle$  and leaves either the maximum or minimum value in the input stream as appropriate, as a  $\langle dimension\ denotation \rangle$ .

---

Updated: 2012-09-26

---

---

`\dim_ratio:nn` ☆ `\dim_ratio:nn {<dim expr1>} {<dim expr2>}`

---

Updated: 2011-10-22 Parses the two `<dim exprs>` and converts the ratio of the two to a form suitable for use inside a `<dim expr>`. This ratio is then left in the input stream, allowing syntax such as

```
\dim_set:Nn \l_my_dim
{ 10 pt * \dim_ratio:nn { 5 pt } { 10 pt } }
```

The output of `\dim_ratio:nn` on full expansion is a ratio expression between two integers, with all distances converted to scaled points. Thus

```
\tl_set:Ne \l_my_tl { \dim_ratio:nn { 5 pt } { 10 pt } }
\tl_show:N \l_my_tl
```

displays 327680/655360 on the terminal.

## 26.4 Dimension expression conditionals

---

`\dim_compare_p:nNn` ☆ `\dim_compare_p:nNn {<dim expr1>} <relation> {<dim expr2>}`  
`\dim_compare:nNnTF` ☆ `\dim_compare:nNnTF`  

---

`{<dim expr1>} <relation> {<dim expr2>}`  
`{<true code>} {<false code>}`

This function first evaluates each of the `<dim exprs>` as described for `\dim_eval:n`. The two results are then compared using the `<relation>`:

Equal	=
Greater than	>
Less than	<

This function is less flexible than `\dim_compare:nTF` but around 5 times faster.

---

```

\dim_compare_p:n * \dim_compare_p:n
\dim_compare:nTF * {
  Updated: 2013-01-13
  \dim_compare_p:n {
    \dim_expr_1 \relation_1
    ...
    \dim_expr_N \relation_N
    \dim_expr_{N+1}
  }
  \dim_compare:nTF {
    \dim_expr_1 \relation_1
    ...
    \dim_expr_N \relation_N
    \dim_expr_{N+1}
  }
  {\true code} {\false code}

```

---

This function evaluates the  $\langle \text{dim exprs} \rangle$  as described for  $\backslash\text{dim\_eval:n}$  and compares consecutive result using the corresponding  $\langle \text{relation} \rangle$ , namely it compares  $\langle \text{dim expr}_1 \rangle$  and  $\langle \text{dim expr}_2 \rangle$  using the  $\langle \text{relation}_1 \rangle$ , then  $\langle \text{dim expr}_2 \rangle$  and  $\langle \text{dim expr}_3 \rangle$  using the  $\langle \text{relation}_2 \rangle$ , until finally comparing  $\langle \text{dim expr}_N \rangle$  and  $\langle \text{dim expr}_{N+1} \rangle$  using the  $\langle \text{relation}_N \rangle$ . The test yields `true` if all comparisons are `true`. Each  $\langle \text{dim expr} \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is `false`, then no other  $\langle \text{dim expr} \rangle$  is evaluated and no other comparison is performed. The  $\langle \text{relations} \rangle$  can be any of the following:

Equal	= or ==
Greater than or equal to	>=
Greater than	>
Less than or equal to	<=
Less than	<
Not equal	!=

This function is more flexible than  $\backslash\text{dim\_compare:nNnTF}$  but around 5 times slower.

<hr/>	<code>\dim_case:nn</code>	★	<code>\dim_case:nnTF</code>	{ <i>⟨test dim expr⟩</i> }
<hr/>	<code>\dim_case:nnTF</code>	★	{	
<hr/>	New: 2013-07-24		{ <i>⟨dim expr case<sub>1</sub>⟩</i> }	{ <i>⟨code case<sub>1</sub>⟩</i> }
<hr/>			{ <i>⟨dim expr case<sub>2</sub>⟩</i> }	{ <i>⟨code case<sub>2</sub>⟩</i> }
			...	
			{ <i>⟨dim expr case<sub>n</sub>⟩</i> }	{ <i>⟨code case<sub>n</sub>⟩</i> }
			}	
			{ <i>⟨true code⟩</i> }	
			{ <i>⟨false code⟩</i> }	

This function evaluates the *⟨test dim expr⟩* and compares this in turn to each of the *⟨dim expr case⟩*s until a match is found. If the two are equal then the associated *⟨code⟩* is left in the input stream and other cases are discarded. If any of the cases are matched, the *⟨true code⟩* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *⟨false code⟩* is inserted. The function `\dim_case:nn`, which does nothing if there is no match, is also available. For example

```

\dim_set:Nn \l_tmpa_dim { 5 pt }
\dim_case:nnF
{ 2 \l_tmpa_dim }
{
  { 5 pt }      { Small }
  { 4 pt + 6 pt } { Medium }
  { - 10 pt }   { Negative }
}
{ No idea! }
```

leaves “Medium” in the input stream. Since evaluation of the test expressions stops at the first successful case, the order of possible matches should normally be that the most likely are earlier: this will reduce the average steps required to complete expansion.

## 26.5 Dimension expression loops

<hr/>	<code>\dim_do_until:nNnn</code>	☆	<code>\dim_do_until:nNnn</code>	{ <i>⟨dim expr<sub>1</sub>⟩</i> }	<i>⟨relation⟩</i>	{ <i>⟨dim expr<sub>2</sub>⟩</i> }	{ <i>⟨code⟩</i> }
-------	---------------------------------	---	---------------------------------	-----------------------------------	-------------------	-----------------------------------	-------------------

Places the *⟨code⟩* in the input stream for T<sub>E</sub>X to process, and then evaluates the relationship between the two *⟨dim exprs⟩* as described for `\dim_compare:nNnTF`. If the test is *false* then the *⟨code⟩* is inserted into the input stream again and a loop occurs until the *⟨relation⟩* is *true*.

<hr/>	<code>\dim_do_while:nNnn</code>	☆	<code>\dim_do_while:nNnn</code>	{ <i>⟨dim expr<sub>1</sub>⟩</i> }	<i>⟨relation⟩</i>	{ <i>⟨dim expr<sub>2</sub>⟩</i> }	{ <i>⟨code⟩</i> }
-------	---------------------------------	---	---------------------------------	-----------------------------------	-------------------	-----------------------------------	-------------------

Places the *⟨code⟩* in the input stream for T<sub>E</sub>X to process, and then evaluates the relationship between the two *⟨dim exprs⟩* as described for `\dim_compare:nNnTF`. If the test is *true* then the *⟨code⟩* is inserted into the input stream again and a loop occurs until the *⟨relation⟩* is *false*.

<hr/> <code>\dim_until_do:nNnn</code> ☆	<code>\dim_until_do:nNnn {&lt;dim expr<sub>1</sub>&gt;} &lt;relation&gt; {&lt;dim expr<sub>2</sub>&gt;} {&lt;code&gt;}</code>
	Evaluates the relationship between the two <code>&lt;dim exprs&gt;</code> as described for <code>\dim_compare:nNnTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is false. After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is true.
<hr/> <code>\dim_while_do:nNnn</code> ☆	<code>\dim_while_do:nNnn {&lt;dim expr<sub>1</sub>&gt;} &lt;relation&gt; {&lt;dim expr<sub>2</sub>&gt;} {&lt;code&gt;}</code>
	Evaluates the relationship between the two <code>&lt;dim exprs&gt;</code> as described for <code>\dim_compare:nNnTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is true. After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is false.
<hr/> <code>\dim_do_until:nn</code> ☆	<code>\dim_do_until:nn {&lt;dimension relation&gt;} {&lt;code&gt;}</code>
Updated: 2013-01-13	Places the <code>&lt;code&gt;</code> in the input stream for T <sub>E</sub> X to process, and then evaluates the <code>&lt;dimension relation&gt;</code> as described for <code>\dim_compare:nTF</code> . If the test is false then the <code>&lt;code&gt;</code> is inserted into the input stream again and a loop occurs until the <code>&lt;relation&gt;</code> is true.
<hr/> <code>\dim_do_while:nn</code> ☆	<code>\dim_do_while:nn {&lt;dimension relation&gt;} {&lt;code&gt;}</code>
Updated: 2013-01-13	Places the <code>&lt;code&gt;</code> in the input stream for T <sub>E</sub> X to process, and then evaluates the <code>&lt;dimension relation&gt;</code> as described for <code>\dim_compare:nTF</code> . If the test is true then the <code>&lt;code&gt;</code> is inserted into the input stream again and a loop occurs until the <code>&lt;relation&gt;</code> is false.
<hr/> <code>\dim_until_do:nn</code> ☆	<code>\dim_until_do:nn {&lt;dimension relation&gt;} {&lt;code&gt;}</code>
Updated: 2013-01-13	Evaluates the <code>&lt;dimension relation&gt;</code> as described for <code>\dim_compare:nTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is false. After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is true.
<hr/> <code>\dim_while_do:nn</code> ☆	<code>\dim_while_do:nn {&lt;dimension relation&gt;} {&lt;code&gt;}</code>
Updated: 2013-01-13	Evaluates the <code>&lt;dimension relation&gt;</code> as described for <code>\dim_compare:nTF</code> , and then places the <code>&lt;code&gt;</code> in the input stream if the <code>&lt;relation&gt;</code> is true. After the <code>&lt;code&gt;</code> has been processed by T <sub>E</sub> X the test is repeated, and a loop occurs until the test is false.

## 26.6 Dimension step functions

<hr/> <code>\dim_step_function:nnnN</code> ☆	<code>\dim_step_function:nnnN {&lt;initial value&gt;} {&lt;step&gt;} {&lt;final value&gt;} &lt;function&gt;</code>
New: 2018-02-18	This function first evaluates the <code>&lt;initial value&gt;</code> , <code>&lt;step&gt;</code> and <code>&lt;final value&gt;</code> , all of which should be dimension expressions. The <code>&lt;function&gt;</code> is then placed in front of each <code>&lt;value&gt;</code> from the <code>&lt;initial value&gt;</code> to the <code>&lt;final value&gt;</code> in turn (using <code>&lt;step&gt;</code> between each <code>&lt;value&gt;</code> ). The <code>&lt;step&gt;</code> must be non-zero. If the <code>&lt;step&gt;</code> is positive, the loop stops when the <code>&lt;value&gt;</code> becomes larger than the <code>&lt;final value&gt;</code> . If the <code>&lt;step&gt;</code> is negative, the loop stops when the <code>&lt;value&gt;</code> becomes smaller than the <code>&lt;final value&gt;</code> . The <code>&lt;function&gt;</code> should absorb one argument.

<hr/> <code>\dim_step_inline:nnnn</code> <hr/>	<code>\dim_step_inline:nnnn {&lt;initial value&gt;} {&lt;step&gt;} {&lt;final value&gt;} {&lt;code&gt;}</code>
<hr/> New: 2018-02-18 <hr/>	This function first evaluates the <code>&lt;initial value&gt;</code> , <code>&lt;step&gt;</code> and <code>&lt;final value&gt;</code> , all of which should be dimension expressions. Then for each <code>&lt;value&gt;</code> from the <code>&lt;initial value&gt;</code> to the <code>&lt;final value&gt;</code> in turn (using <code>&lt;step&gt;</code> between each <code>&lt;value&gt;</code> ), the <code>&lt;code&gt;</code> is inserted into the input stream with <code>#1</code> replaced by the current <code>&lt;value&gt;</code> . Thus the <code>&lt;code&gt;</code> should define a function of one argument ( <code>#1</code> ).
<hr/> <code>\dim_step_variable:nnnNn</code> <hr/>	<code>\dim_step_variable:nnnNn {&lt;initial value&gt;} {&lt;step&gt;} {&lt;final value&gt;} &lt;tl var&gt; {&lt;code&gt;}</code>
<hr/> New: 2018-02-18 <hr/>	This function first evaluates the <code>&lt;initial value&gt;</code> , <code>&lt;step&gt;</code> and <code>&lt;final value&gt;</code> , all of which should be dimension expressions. Then for each <code>&lt;value&gt;</code> from the <code>&lt;initial value&gt;</code> to the <code>&lt;final value&gt;</code> in turn (using <code>&lt;step&gt;</code> between each <code>&lt;value&gt;</code> ), the <code>&lt;code&gt;</code> is inserted into the input stream, with the <code>&lt;tl var&gt;</code> defined as the current <code>&lt;value&gt;</code> . Thus the <code>&lt;code&gt;</code> should make use of the <code>&lt;tl var&gt;</code> .

## 26.7 Using dim expressions and variables

<hr/> <code>\dim_eval:n</code> ★ <hr/>	<code>\dim_eval:n {&lt;dim expr&gt;}</code>
<hr/> Updated: 2011-10-22 <hr/>	Evaluates the <code>&lt;dim expr&gt;</code> , expanding any dimensions and token list variables within the <code>&lt;expression&gt;</code> to their content (without requiring <code>\dim_use:N/\tl_use:N</code> ) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a <code>&lt;dimension denotation&gt;</code> after two expansions. This is expressed in points ( <code>pt</code> ), and requires suitable termination if used in a $\TeX$ -style assignment as it is <i>not</i> an <code>&lt;internal dimension&gt;</code> .
<hr/> <code>\dim_sign:n</code> ★ <hr/>	<code>\dim_sign:n {&lt;dim expr&gt;}</code>
<hr/> New: 2018-11-03 <hr/>	Evaluates the <code>&lt;dim expr&gt;</code> then leaves 1 or 0 or $-1$ in the input stream according to the sign of the result.
<hr/> <code>\dim_use:N</code> ★ <hr/>	<code>\dim_use:N &lt;dimension&gt;</code>
<hr/> <code>\dim_use:c</code> ★ <hr/>	Recovers the content of a <code>&lt;dimension&gt;</code> and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a <code>&lt;dimension&gt;</code> is required (such as in the argument of <code>\dim_eval:n</code> ).

**$\TeX$ hackers note:** `\dim_use:N` is the  $\TeX$  primitive `\the`: this is one of several  $\LaTeX$ 3 names for this primitive.

<hr/> <code>\dim_to_decimal:n</code> ★ <hr/>	<code>\dim_to_decimal:n {&lt;dim expr&gt;}</code>
<hr/> New: 2014-07-15 <hr/>	Evaluates the <code>&lt;dim expr&gt;</code> , and leaves the result, expressed in points ( <code>pt</code> ) in the input stream, with <i>no units</i> . The result is rounded by $\TeX$ to at most five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker. For example  <code>\dim_to_decimal:n { 1bp }</code>  leaves 1.00374 in the input stream, i.e., the magnitude of one “big point” when converted to ( $\TeX$ ) points.

---

`\dim_to_decimal_in_bp:n` ★ `\dim_to_decimal_in_bp:n {⟨dim expr⟩}`

---

New: 2014-07-15  
Updated: 2023-05-20

---

Evaluates the `⟨dim expr⟩`, and leaves the result, expressed in big points (`bp`) in the input stream, with *no units*. The result is rounded by `TeX` to at most five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal_in_bp:n { 1pt }
```

leaves 0.99628 in the input stream, i.e., the magnitude of one (`TeX`) point when converted to big points.

**TeXhackers note:** The implementation of this function is re-entrant: the result of

```
\dim_compare:nNnTF
{ <x>bp } =
{ \dim_to_decimal_in_bp:n { <x>bp } bp }
```

will be logically `true`. The decimal representations may differ provided they produce the same `TeX` dimension.

---

`\dim_to_decimal_in_cc:n` ★ `\dim_to_decimal_in_cm:n` {⟨dim expr⟩}

---

`\dim_to_decimal_in_cm:n` ★  
`\dim_to_decimal_in_dd:n` ★  
`\dim_to_decimal_in_in:n` ★  
`\dim_to_decimal_in_mm:n` ★  
`\dim_to_decimal_in_pc:n` ★

Evaluates the `⟨dim expr⟩`, and leaves the result, expressed with the appropriate scaling in the input stream, with *no units*. If the decimal part of the result is zero, it is omitted, together with the decimal marker. The precisions of the result is limited to a maximum of five decimal places with trailing zeros omitted.

New: 2023-05-20

---

The maximum `TeX` allowable dimension value (available as `\maxdimen` in plain `TeX` and `LaTeX` and `\c_max_dim` in `expl3`) can only be expressed exactly in the units `pt`, `bp` and `sp`. The maximum allowable input values to five decimal places are

```
1276.00215 cc
575.83174 cm
15312.02584 dd
226.70540 in
5758.31742 mm
1365.33333 pc
```

(Note that these are not all equal, but rather any larger value will overflow due to the way `TeX` converts to `sp`.) Values given to five decimal places larger than these will result in `TeX` errors; the behavior if additional decimal places are given depends on the `TeX` internals and thus larger values are *not* supported by `expl3`.

**TeXhackers note:** The implementation of these functions is re-entrant: the result of

```
\dim_compare:nNnTF
{ <x><unit> } =
{ \dim_to_decimal_in_<unit>:n { <x><unit> } <unit> }
```

will be logically `true`. The decimal representations may differ provided they produce the same `TeX` dimension.

<hr/> <code>\dim_to_decimal_in_sp:n</code> ★	<code>\dim_to_decimal_in_sp:n {⟨<i>dim expr</i>⟩}</code>
<hr/> New: 2015-05-18	Evaluates the <code>⟨<i>dim expr</i>⟩</code> , and leaves the result, expressed in scaled points ( <code>sp</code> ) in the input stream, with <i>no units</i> . The result is necessarily an integer.

<hr/> <code>\dim_to_decimal_in_unit:nn</code> ★	<code>\dim_to_decimal_in_unit:nn {⟨<i>dim expr</i><sub>1</sub>⟩} {⟨<i>dim expr</i><sub>2</sub>⟩}</code>
<hr/> New: 2014-07-15	
<hr/> Updated: 2023-05-20	

Evaluates the `⟨dim exprs⟩`, and leaves the value of `⟨dim expr1⟩`, expressed in a unit given by `⟨dim expr2⟩`, in the input stream. If the decimal part of the result is zero, it is omitted, together with the decimal marker. The precisions of the result is limited to a maximum of five decimal places with trailing zeros omitted.

For example

```
\dim_to_decimal_in_unit:nn { 1bp } { 1mm }
```

leaves 0.35278 in the input stream, i.e., the magnitude of one big point when expressed in millimetres. The conversions do *not* guarantee that  $\mathrm{T\!E\!X}$  would yield identical results for the direct input in an equality test, thus for instance

```
\dim_compare:nNnTF
{ 1bp } =
{ \dim_to_decimal_in_unit:nn { 1bp } { 1mm } mm }
```

will take the `false` branch.

<hr/> <code>\dim_to_fp:n</code> ★	<code>\dim_to_fp:n {⟨<i>dim expr</i>⟩}</code>
<hr/> New: 2012-05-08	Expands to an internal floating point number equal to the value of the <code>⟨<i>dim expr</i>⟩</code> in pt. Since dimension expressions are evaluated much faster than their floating point equivalent, <code>\dim_to_fp:n</code> can be used to speed up parts of a computation where a low precision and a smaller range are acceptable.

## 26.8 Viewing dim variables

<hr/> <code>\dim_show:N</code>	<code>\dim_show:N ⟨<i>dimension</i>⟩</code>
<hr/> <code>\dim_show:c</code>	Displays the value of the <code>⟨<i>dimension</i>⟩</code> on the terminal.

<hr/> <code>\dim_show:n</code>	<code>\dim_show:n {⟨<i>dim expr</i>⟩}</code>
<hr/> New: 2011-11-22	Displays the result of evaluating the <code>⟨<i>dim expr</i>⟩</code> on the terminal.
<hr/> Updated: 2015-08-07	

<hr/> <code>\dim_log:N</code>	<code>\dim_log:N ⟨<i>dimension</i>⟩</code>
<hr/> <code>\dim_log:c</code>	Writes the value of the <code>⟨<i>dimension</i>⟩</code> in the log file.
<hr/> New: 2014-08-22	
<hr/> Updated: 2015-08-03	

<hr/> <code>\dim_log:n</code> <hr/>	<code>\dim_log:n {⟨dim expr⟩}</code>
New: 2014-08-22 Updated: 2015-08-07	Writes the result of evaluating the <code>⟨dim expr⟩</code> in the log file.

## 26.9 Constant dimensions

<hr/> <code>\c_max_dim</code> <hr/>	The maximum value that can be stored as a dimension. This can also be used as a component of a skip.
<hr/> <code>\c_zero_dim</code> <hr/>	A zero length as a dimension. This can also be used as a component of a skip.

## 26.10 Scratch dimensions

<hr/> <code>\l_tmpa_dim</code> <hr/> <code>\l_tmpb_dim</code> <hr/>	Scratch dimension for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<hr/> <code>\g_tmpa_dim</code> <hr/> <code>\g_tmpb_dim</code> <hr/>	Scratch dimension for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 26.11 Creating and initialising skip variables

<hr/> <code>\skip_new:N</code> <hr/> <code>\skip_new:c</code> <hr/>	<code>\skip_new:N ⟨skip⟩</code> Creates a new <code>⟨skip⟩</code> or raises an error if the name is already taken. The declaration is global. The <code>⟨skip⟩</code> is initially equal to 0 pt.
<hr/> <code>\skip_const:Nn</code> <hr/> <code>\skip_const:cn</code> New: 2012-03-05 <hr/>	<code>\skip_const:Nn ⟨skip⟩ {⟨skip expr⟩}</code> Creates a new constant <code>⟨skip⟩</code> or raises an error if the name is already taken. The value of the <code>⟨skip⟩</code> is set globally to the <code>⟨skip expr⟩</code> .
<hr/> <code>\skip_zero:N</code> <hr/> <code>\skip_zero:c</code> <hr/> <code>\skip_gzero:N</code> <hr/> <code>\skip_gzero:c</code> <hr/>	<code>\skip_zero:N ⟨skip⟩</code> Sets <code>⟨skip⟩</code> to 0 pt.

---

<code>\skip_zero_new:N</code>	<code>\skip_zero_new:N</code> $\langle skip \rangle$
<code>\skip_zero_new:c</code>	
<code>\skip_gzero_new:N</code>	Ensures that the $\langle skip \rangle$ exists globally by applying <code>\skip_new:N</code> if necessary, then applies <code>\skip_(g)zero:N</code> to leave the $\langle skip \rangle$ set to zero.
<code>\skip_gzero_new:c</code>	

---

New: 2012-01-07

---

---

<code>\skip_if_exist_p:N</code> *	<code>\skip_if_exist_p:N</code> $\langle skip \rangle$
<code>\skip_if_exist_p:c</code> *	<code>\skip_if_exist:NTF</code> $\langle skip \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\skip_if_exist:NTF</code> *	
<code>\skip_if_exist:cTF</code> *	Tests whether the $\langle skip \rangle$ is currently defined. This does not check that the $\langle skip \rangle$ really is a skip variable.

---

New: 2012-03-03

---

## 26.12 Setting skip variables

---

<code>\skip_add:Nn</code>	<code>\skip_add:Nn</code> $\langle skip \rangle$ $\{\langle skip\ expr \rangle\}$
<code>\skip_add:cn</code>	
<code>\skip_gadd:Nn</code>	Adds the result of the $\langle skip\ expr \rangle$ to the current content of the $\langle skip \rangle$ .
<code>\skip_gadd:cn</code>	

---

Updated: 2011-10-22

---

---

<code>\skip_set:Nn</code>	<code>\skip_set:Nn</code> $\langle skip \rangle$ $\{\langle skip\ expr \rangle\}$
<code>\skip_set:(cn NV cV)</code>	
<code>\skip_gset:Nn</code>	Sets $\langle skip \rangle$ to the value of $\langle skip\ expr \rangle$ , which must evaluate to a length with units and may include a rubber component (for example 1 cm plus 0.5 cm).
<code>\skip_gset:(cn NV cV)</code>	

---

Updated: 2011-10-22

---

---

<code>\skip_set_eq:NN</code>	<code>\skip_set_eq:NN</code> $\langle skip_1 \rangle$ $\langle skip_2 \rangle$
<code>\skip_set_eq:(cN Nc cc)</code>	
<code>\skip_gset_eq:NN</code>	Sets the content of $\langle skip_1 \rangle$ equal to that of $\langle skip_2 \rangle$ .
<code>\skip_gset_eq:(cN Nc cc)</code>	

---

---

<code>\skip_sub:Nn</code>	<code>\skip_sub:Nn</code> $\langle skip \rangle$ $\{\langle skip\ expr \rangle\}$
<code>\skip_sub:cn</code>	
<code>\skip_gsub:Nn</code>	Subtracts the result of the $\langle skip\ expr \rangle$ from the current content of the $\langle skip \rangle$ .
<code>\skip_gsub:cn</code>	

---

Updated: 2011-10-22

---

## 26.13 Skip expression conditionals

---

<code>\skip_if_eq_p:nn</code>	<code>*</code>	<code>\skip_if_eq_p:nn {&lt;skip expr<sub>1</sub>&gt;} {&lt;skip expr<sub>2</sub>&gt;}</code>
<code>\skip_if_eq:nnTF</code>	<code>*</code>	<code>\skip_if_eq:nnTF</code> <code>{&lt;skip expr<sub>1</sub>&gt;} {&lt;skip expr<sub>2</sub>&gt;}</code> <code>{&lt;true code&gt;} {&lt;false code&gt;}</code>

---

This function first evaluates each of the `<skip exprs>` as described for `\skip_eval:n`. The two results are then compared for exact equality, i.e., both the fixed and rubber components must be the same for the test to be true.

---

<code>\skip_if_finite_p:n</code>	<code>*</code>	<code>\skip_if_finite_p:n {&lt;skip expr&gt;}</code>
<code>\skip_if_finite:nTF</code>	<code>*</code>	<code>\skip_if_finite:nTF {&lt;skip expr&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>

---

New: 2012-03-05 Evaluates the `<skip expr>` as described for `\skip_eval:n`, and then tests if all of its components are finite.

## 26.14 Using skip expressions and variables

---

<code>\skip_eval:n</code>	<code>*</code>	<code>\skip_eval:n {&lt;skip expr&gt;}</code>
---------------------------	----------------	---

---

Updated: 2011-10-22 Evaluates the `<skip expr>`, expanding any skips and token list variables within the `<expression>` to their content (without requiring `\skip_use:N/\tl_use:N`) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a `<glue denotation>` after two expansions. This is expressed in points (pt), and requires suitable termination if used in a T<sub>E</sub>X-style assignment as it is *not* an `<internal glue>`.

---

<code>\skip_use:N</code>	<code>*</code>	<code>\skip_use:N &lt;skip&gt;</code>
--------------------------	----------------	---------------------------------------

---

`\skip_use:c` `*` Recovers the content of a `<skip>` and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a `<dimension>` or `<skip>` is required (such as in the argument of `\skip_eval:n`).

**T<sub>E</sub>Xhackers note:** `\skip_use:N` is the T<sub>E</sub>X primitive `\the`: this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 26.15 Viewing skip variables

---

<code>\skip_show:N</code>	<code>\skip_show:N &lt;skip&gt;</code>
---------------------------	--

---

`\skip_show:c` Displays the value of the `<skip>` on the terminal.

Updated: 2015-08-03

---

<code>\skip_show:n</code>	<code>\skip_show:n {&lt;skip expr&gt;}</code>
---------------------------	---

---

New: 2011-11-22 Displays the result of evaluating the `<skip expr>` on the terminal.

Updated: 2015-08-07

---

<code>\skip_log:N</code>	<code>\skip_log:N &lt;skip&gt;</code>
<code>\skip_log:c</code>	Writes the value of the <code>&lt;skip&gt;</code> in the log file.
New: 2014-08-22	
Updated: 2015-08-03	

---

---

<code>\skip_log:n</code>	<code>\skip_log:n {\&lt;skip expr&gt;}</code>
New: 2014-08-22	
Updated: 2015-08-07	

---

## 26.16 Constant skips

---

<code>\c_max_skip</code>	The maximum value that can be stored as a skip (equal to <code>\c_max_dim</code> in length), with no stretch nor shrink component.
Updated: 2012-11-02	

---

---

<code>\c_zero_skip</code>	A zero length as a skip, with no stretch nor shrink component.
Updated: 2012-11-01	

---

## 26.17 Scratch skips

---

<code>\l_tmpa_skip</code>	Scratch skip for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_skip</code>	

---

---

<code>\g_tmpa_skip</code>	Scratch skip for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_skip</code>	

---

## 26.18 Inserting skips into the output

---

<code>\skip_horizontal:N</code>	<code>\skip_horizontal:N &lt;skip&gt;</code>
<code>\skip_horizontal:c</code>	<code>\skip_horizontal:n {\&lt;skip expr&gt;}</code>
<code>\skip_horizontal:n</code>	Inserts a horizontal <code>&lt;skip&gt;</code> into the current list. The argument can also be a <code>&lt;dim&gt;</code> .
Updated: 2011-10-22	

---

**T<sub>E</sub>Xhackers note:** `\skip_horizontal:N` is the T<sub>E</sub>X primitive `\hskip`.

---

<code>\skip_vertical:N</code>	<code>\skip_vertical:N &lt;skip&gt;</code>
<code>\skip_vertical:c</code>	<code>\skip_vertical:n {&lt;skip expr&gt;}</code>
<code>\skip_vertical:n</code>	Inserts a vertical <code>&lt;skip&gt;</code> into the current list. The argument can also be a <code>&lt;dim&gt;</code> .
Updated: 2011-10-22	

---

T<sub>E</sub>Xhackers note: `\skip_vertical:N` is the T<sub>E</sub>X primitive `\vskip`.

## 26.19 Creating and initialising muskip variables

---

<code>\muskip_new:N</code>	<code>\muskip_new:N &lt;muskip&gt;</code>
<code>\muskip_new:c</code>	Creates a new <code>&lt;muskip&gt;</code> or raises an error if the name is already taken. The declaration is global. The <code>&lt;muskip&gt;</code> is initially equal to 0 mu.

---

---

<code>\muskip_const:Nn</code>	<code>\muskip_const:Nn &lt;muskip&gt; {&lt;muskip expr&gt;}</code>
<code>\muskip_const:cn</code>	Creates a new constant <code>&lt;muskip&gt;</code> or raises an error if the name is already taken. The value of the <code>&lt;muskip&gt;</code> is set globally to the <code>&lt;muskip expr&gt;</code> .
New: 2012-03-05	

---

---

<code>\muskip_zero:N</code>	<code>\skip_zero:N &lt;muskip&gt;</code>
<code>\muskip_zero:c</code>	Sets <code>&lt;muskip&gt;</code> to 0 mu.
<code>\muskip_gzero:N</code>	
<code>\muskip_gzero:c</code>	

---

<code>\muskip_zero_new:N</code>	<code>\muskip_zero_new:N</code> $\langle muskip \rangle$
<code>\muskip_zero_new:c</code>	Ensures that the $\langle muskip \rangle$ exists globally by applying <code>\muskip_new:N</code> if necessary, then applies <code>\muskip_(g)zero:N</code> to leave the $\langle muskip \rangle$ set to zero.
<code>\muskip_gzero_new:N</code>	
<code>\muskip_gzero_new:c</code>	
<hr/>	
New: 2012-01-07	

---

<code>\muskip_if_exist_p:N</code>	<code>\muskip_if_exist_p:N</code> $\langle muskip \rangle$
<code>\muskip_if_exist_p:c</code>	<code>\muskip_if_exist:NTF</code> $\langle muskip \rangle$ $\{\langle true\ code \rangle\}$ $\{\langle false\ code \rangle\}$
<code>\muskip_if_exist:NTF</code>	Tests whether the $\langle muskip \rangle$ is currently defined. This does not check that the $\langle muskip \rangle$ really is a muskip variable.
<code>\muskip_if_exist:cTF</code>	

---

New: 2012-03-03

## 26.20 Setting muskip variables

<code>\muskip_add:Nn</code>	<code>\muskip_add:Nn &lt;muskip&gt; {&lt;muskip expr&gt;}</code>
<code>\muskip_add:cn</code>	Adds the result of the <code>&lt;muskip expr&gt;</code> to the current content of the <code>&lt;muskip&gt;</code> .
<code>\muskip_gadd:Nn</code>	
<code>\muskip_gadd:cn</code>	
<hr/>	
Updated: 2011-10-22	

<hr/>	
<code>\muskip_set:Nn</code>	<code>\muskip_set:Nn &lt;muskip&gt; {&lt;muskip expr&gt;}</code>
<code>\muskip_set:(cn NV cV)</code>	Sets <code>&lt;muskip&gt;</code> to the value of <code>&lt;muskip expr&gt;</code> , which must evaluate to a math length with units and may include a rubber component (for example 1 mu plus 0.5 mu).
<code>\muskip_gset:Nn</code>	
<code>\muskip_gset:(cn NV cV)</code>	
<hr/>	
Updated: 2011-10-22	
<hr/>	
<code>\muskip_set_eq:NN</code>	<code>\muskip_set_eq:NN &lt;muskip<sub>1</sub>&gt; &lt;muskip<sub>2</sub>&gt;</code>
<code>\muskip_set_eq:(cN Nc cc)</code>	Sets the content of <code>&lt;muskip<sub>1</sub>&gt;</code> equal to that of <code>&lt;muskip<sub>2</sub>&gt;</code> .
<code>\muskip_gset_eq:NN</code>	
<code>\muskip_gset_eq:(cN Nc cc)</code>	
<hr/>	
<code>\muskip_sub:Nn</code>	<code>\muskip_sub:Nn &lt;muskip&gt; {&lt;muskip expr&gt;}</code>
<code>\muskip_sub:cn</code>	Subtracts the result of the <code>&lt;muskip expr&gt;</code> from the current content of the <code>&lt;muskip&gt;</code> .
<code>\muskip_gsub:Nn</code>	
<code>\muskip_gsub:cn</code>	
<hr/>	
Updated: 2011-10-22	

## 26.21 Using muskip expressions and variables

<hr/>	
<code>\muskip_eval:n *</code>	<code>\muskip_eval:n {&lt;muskip expr&gt;}</code>
<hr/>	
Updated: 2011-10-22	Evaluates the <code>&lt;muskip expr&gt;</code> , expanding any skips and token list variables within the <code>&lt;expression&gt;</code> to their content (without requiring <code>\muskip_use:N/\tl_use:N</code> ) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a <code>&lt;muglue denotation&gt;</code> after two expansions. This is expressed in mu, and requires suitable termination if used in a T <sub>E</sub> X-style assignment as it is <i>not</i> an <code>&lt;internal muglue&gt;</code> .
<hr/>	
<code>\muskip_use:N *</code>	<code>\muskip_use:N &lt;muskip&gt;</code>
<code>\muskip_use:c *</code>	Recovers the content of a <code>&lt;skip&gt;</code> and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a <code>&lt;dimension&gt;</code> is required (such as in the argument of <code>\muskip_eval:n</code> ).

**T<sub>E</sub>Xhackers note:** `\muskip_use:N` is the T<sub>E</sub>X primitive `\the`: this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 26.22 Viewing muskip variables

<hr/>	
<code>\muskip_show:N</code>	<code>\muskip_show:N &lt;muskip&gt;</code>
<code>\muskip_show:c</code>	Displays the value of the <code>&lt;muskip&gt;</code> on the terminal.
<hr/>	
Updated: 2015-08-03	

<hr/> <code>\muskip_show:n</code> <hr/>	<code>\muskip_show:n {⟨<i>muskip expr</i>⟩}</code>
New: 2011-11-22 Updated: 2015-08-07	Displays the result of evaluating the <code>⟨<i>muskip expr</i>⟩</code> on the terminal.
<hr/> <code>\muskip_log:N</code> <code>\muskip_log:c</code> <hr/>	<code>\muskip_log:N ⟨<i>muskip</i>⟩</code> Writes the value of the <code>⟨<i>muskip</i>⟩</code> in the log file.
New: 2014-08-22 Updated: 2015-08-03	
<hr/> <code>\muskip_log:n</code> <hr/>	<code>\muskip_log:n {⟨<i>muskip expr</i>⟩}</code>
New: 2014-08-22 Updated: 2015-08-07	Writes the result of evaluating the <code>⟨<i>muskip expr</i>⟩</code> in the log file.

## 26.23 Constant muskips

<hr/> <code>\c_max_muskip</code> <hr/>	The maximum value that can be stored as a muskip, with no stretch nor shrink component.
<hr/> <code>\c_zero_muskip</code> <hr/>	A zero length as a muskip, with no stretch nor shrink component.

## 26.24 Scratch muskips

<hr/> <code>\l_tmpa_muskip</code> <code>\l_tmpb_muskip</code> <hr/>	Scratch muskip for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<hr/> <code>\g_tmpa_muskip</code> <code>\g_tmpb_muskip</code> <hr/>	Scratch muskip for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 26.25 Primitive conditional

<hr/> <code>\if_dim:w ★</code> <hr/>	<code>\if_dim:w ⟨<i>dimen</i><sub>1</sub>⟩ ⟨<i>relation</i>⟩ ⟨<i>dimen</i><sub>2</sub>⟩</code> <code>⟨<i>true code</i>⟩</code> <code>\else:</code> <code>⟨<i>false</i>⟩</code> <code>\fi:</code>
	Compare two dimensions. The <code>⟨<i>relation</i>⟩</code> is one of <code>&lt;</code> , <code>=</code> or <code>&gt;</code> with category code 12.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifdim`.

## Chapter 27

# The l3keys module

## Key–value interfaces

The key–value method is a popular system for creating large numbers of settings for controlling function or package behaviour. The system normally results in input of the form

```
\MyModuleSetup{
  key-one = value one,
  key-two = value two
}
```

or

```
\MyModuleMacro[
  key-one = value one,
  key-two = value two
]{argument}
```

for the user.

The high level functions here are intended as a method to create key–value controls. Keys are themselves created using a key–value interface, minimising the number of functions and arguments required. Each key is created by setting one or more *properties* of the key:

```
\keys_define:nn { mymodule }
{
  key-one .code:n    = code including parameter #1,
  key-two .tl_set:N = \l_mymodule_store_tl
}
```

These values can then be set as with other key–value approaches:

```
\keys_set:nn { mymodule }
{
  key-one = value one,
  key-two = value two
}
```

As illustrated, keys are created inside a  $\langle module \rangle$ : a set of related keys, typically those for a single module/L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> package. See Section 27.2 for suggestions on how to divide large numbers of keys for a single module.

At a document level, `\keys_set:nn` is used within a document function, for example

```
\DeclareDocumentCommand \MyModuleSetup { m }
  { \keys_set:nn { mymodule } { #1 } }
\DeclareDocumentCommand \MyModuleMacro { o m }
{
  \group_begin:
    \keys_set:nn { mymodule } { #1 }
    % Main code for \MyModuleMacro
  \group_end:
}
```

Key names may contain any tokens, as they are handled internally using `\tl_to_str:n`. As discussed in section 27.2, it is suggested that the character `/` is reserved for sub-division of keys into different subsets. Functions and variables are *not* expanded when creating key names, and so

```
\tl_set:Nn \l_mymodule_tmp_tl { key }
\keys_define:nn { mymodule }
{
  \l_mymodule_tmp_tl .code:n = code
}
```

creates a key called `\l_mymodule_tmp_tl`, and not one called `key`.

## 27.1 Creating keys

---

```
\keys_define:nn \keys_define:nn { $\langle module \rangle$ } { $\langle keyval list \rangle$ }
```

---

```
\keys_define:ne
```

---

Updated: 2017-11-14

---

Parses the  $\langle keyval list \rangle$  and defines the keys listed there for  $\langle module \rangle$ . The  $\langle module \rangle$  name is treated as a string. In practice the  $\langle module \rangle$  should be chosen to be unique to the module in question (unless deliberately adding keys to an existing module).

The  $\langle keyval list \rangle$  should consist of one or more key names along with an associated key *property*. The properties of a key determine how it acts. The individual properties are described in the following text; a typical use of `\keys_define:nn` might read

```
\keys_define:nn { mymodule }
{
  keyname .code:n = Some-code~using~#1,
  keyname .value_required:n = true
}
```

where the properties of the key begin from the `.` after the key name.

The various properties available take either no arguments at all, or require one or more arguments. This is indicated in the name of the property using an argument specification. In the following discussion, each property is illustrated attached to an arbitrary  $\langle key \rangle$ , which when used may be supplied with a  $\langle value \rangle$ . All key *definitions* are local.

Key properties are applied in the reading order and so the ordering is significant. Key properties which define “actions”, such as `.code:n`, `.tl_set:N`, etc., override one another. Some other properties are mutually exclusive, notably `.value_required:n` and `.value_forbidden:n`, and so they replace one another. However, properties covering non-exclusive behaviours may be given in any order. Thus for example the following definitions are equivalent.

```
\keys_define:nn { mymodule }
{
  keyname .code:n          = Some~code~using~#1,
  keyname .value_required:n = true
}
\keys_define:nn { mymodule }
{
  keyname .value_required:n = true,
  keyname .code:n          = Some~code~using~#1
}
```

Note that all key properties define the key within the current T<sub>E</sub>X group, with an exception that the special `.undefine:` property *undefines* the key within the current T<sub>E</sub>X group.

---

<code>.bool_set:N</code>	<code>&lt;key&gt; .bool_set:N = &lt;boolean&gt;</code>
--------------------------	--

---

<code>.bool_set:c</code>	
--------------------------	--

---

<code>.bool_gset:N</code>	
---------------------------	--

---

<code>.bool_gset:c</code>	
---------------------------	--

---

Updated: 2013-07-08

---

Defines `<key>` to set `<boolean>` to `<value>`. If the `<value>` is given, it must be one either “true” or “false”; it may be omitted, which is equivalent to `true`. If the variable does not exist, it will be created globally at the point that the key is set up.

---

<code>.bool_set_inverse:N</code>	<code>&lt;key&gt; .bool_set_inverse:N = &lt;boolean&gt;</code>
----------------------------------	--

---

<code>.bool_set_inverse:c</code>	
----------------------------------	--

<code>.bool_gset_inverse:N</code>	
-----------------------------------	--

---

<code>.bool_gset_inverse:c</code>	
-----------------------------------	--

---

New: 2011-08-28

---

Updated: 2013-07-08

---

Defines `<key>` to set `<boolean>` to the logical inverse of `<value>` (which must be either “true” or “false”). If the `<boolean>` does not exist, it will be created globally at the point that the key is set up.

---

<code>.choice:</code>	<code>&lt;key&gt; .choice:</code>
-----------------------	-----------------------------------

---

Sets `<key>` to act as a choice key. Each valid choice for `<key>` must then be created, as discussed in section 27.3.

---

<code>.choices:nn</code>	<code>&lt;key&gt; .choices:nn = {&lt;choices&gt;} {&lt;code&gt;}</code>
--------------------------	---

---

<code>.choices:(Vn en on)</code>	
----------------------------------	--

---

New: 2011-08-21

---

Updated: 2013-07-10

---

Sets `<key>` to act as a choice key, and defines a series `<choices>` which are implemented using the `<code>`. Inside `<code>`, `\l_keys_choice_tl` will be the name of the choice made, and `\l_keys_choice_int` will be the position of the choice in the list of `<choices>` (indexed from 1). Choices are discussed in detail in section 27.3.

---

<code>.clist_set:N</code>	<code>&lt;key&gt; .clist_set:N = &lt;comma list variable&gt;</code>
---------------------------	---

---

<code>.clist_set:c</code>	
---------------------------	--

---

<code>.clist_gset:N</code>

---

<code>.clist_gset:c</code>	
----------------------------	--

---

New: 2011-09-11

---

Defines `<key>` to set `<comma list variable>` to `<value>`. Spaces around commas and empty items will be stripped. If the variable does not exist, it is created globally at the point that the key is set up.

<u>.code:n</u>	$\langle key \rangle$ .code:n = { $\langle code \rangle$ }
<u>Updated: 2013-07-10</u>	Stores the $\langle code \rangle$ for execution when $\langle key \rangle$ is used. The $\langle code \rangle$ can include one parameter (#1), which will be the $\langle value \rangle$ given for the $\langle key \rangle$ .
<u>.cs_set:Np</u>	$\langle key \rangle$ .cs_set:Np = $\langle control\ sequence \rangle$ $\langle arg.\ spec. \rangle$
<u>.cs_set:cp</u>	Defines $\langle key \rangle$ to set $\langle control\ sequence \rangle$ to have $\langle arg.\ spec. \rangle$ and replacement text $\langle value \rangle$ .
<u>.cs_set_protected:Np</u>	
<u>.cs_set_protected:cp</u>	
<u>.cs_gset:Np</u>	
<u>.cs_gset:cp</u>	
<u>.cs_gset_protected:Np</u>	
<u>.cs_gset_protected:cp</u>	
<u>New: 2020-01-11</u>	
<u>.default:n</u>	$\langle key \rangle$ .default:n = { $\langle default \rangle$ }
<u>.default:(V e o)</u>	Creates a $\langle default \rangle$ value for $\langle key \rangle$ , which is used if no value is given. This will be used if only the key name is given, but not if a blank $\langle value \rangle$ is given:
<u>Updated: 2013-07-09</u>	
	<pre>\keys_define:nn { mymodule } {   key .code:n      = Hello~#1,   key .default:n = World } \keys_set:nn { mymodule } {   key = Fred, % Prints 'Hello Fred'   key,      % Prints 'Hello World'   key = ,    % Prints 'Hello ' }</pre>
	<p>The default does not affect keys where values are required or forbidden. Thus a required value cannot be supplied by a default value, and giving a default value for a key which cannot take a value does not trigger an error.</p> <p>When no value is given for a key as part of <code>\keys_set:nn</code>, the <code>.default:n</code> value provides the value before key properties are considered. The only exception is when the <code>.value_required:n</code> property is active: a required value cannot be supplied by the default, and must be explicitly given as part of <code>\keys_set:nn</code>.</p>
<u>.dim_set:N</u>	$\langle key \rangle$ .dim_set:N = $\langle dimension \rangle$
<u>.dim_set:c</u>	Defines $\langle key \rangle$ to set $\langle dimension \rangle$ to $\langle value \rangle$ (which must a dimension expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.
<u>.dim_gset:N</u>	
<u>.dim_gset:c</u>	
<u>Updated: 2020-01-17</u>	
<u>.fp_set:N</u>	$\langle key \rangle$ .fp_set:N = $\langle fp\ var \rangle$
<u>.fp_set:c</u>	Defines $\langle key \rangle$ to set $\langle fp\ var \rangle$ to $\langle value \rangle$ (which must a floating point expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.
<u>.fp_gset:N</u>	
<u>.fp_gset:c</u>	
<u>Updated: 2020-01-17</u>	

---

<code>.groups:n</code>	<code>&lt;key&gt; .groups:n = {&lt;groups&gt;}</code>
------------------------	---

---

New: 2013-07-14 Defines `<key>` as belonging to the `<groups>` (a comma-separated list). Groups provide a “secondary axis” for selectively setting keys, and are described in Section 27.7.

**TeXhackers note:** The `<groups>` argument is turned into a string then interpreted as a comma-separated list, so group names cannot contain commas nor start or end with a space character.

---

<code>.inherit:n</code>	<code>&lt;key&gt; .inherit:n = {&lt;parents&gt;}</code>
-------------------------	---

---

New: 2016-11-22 Specifies that the `<key>` path should inherit the keys listed as any of the `<parents>` (a comma list), which can be a module or a sub-division thereof. For example, after setting

```
\keys_define:nn { foo } { test .code:n = \tl_show:n {#1} }
\keys_define:nn { } { bar .inherit:n = foo }
```

setting

```
\keys_set:nn { bar } { test = a }
```

will be equivalent to

```
\keys_set:nn { foo } { test = a }
```

Inheritance applies at point of use, not at definition, thus keys may be added to the `<parent>` after the use of `.inherit:n` and will be active. If more than one `<parent>` is specified, the presence of the `<key>` will be tested for each in turn, with the first successful hit taking priority.

---

<code>.initial:n</code>	<code>&lt;key&gt; .initial:n = {&lt;value&gt;}</code>
-------------------------	---

---

`.initial:(V|e|o)` Initialises the `<key>` with the `<value>`, equivalent to

Updated: 2013-07-09

```
\keys_set:nn {<module>} { <key> = <value> }
```

---

<code>.int_set:N</code>	<code>&lt;key&gt; .int_set:N = &lt;integer&gt;</code>
-------------------------	---

---

`.int_set:c` Defines `<key>` to set `<integer>` to `<value>` (which must be an integer expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

`.int_gset:N`

`.int_gset:c`

Updated: 2020-01-17

---

<code>.legacy_if_set:n</code>	<code>&lt;key&gt; .legacy_if_set:n = &lt;switch&gt;</code>
-------------------------------	--

---

`.legacy_if_gset:n`

`.legacy_if_set_inverse:n`

`.legacy_if_gset_inverse:n`

Defines `<key>` to set legacy `\if<switch>` to `<value>` (which must be either “true” or “false”). The `<switch>` is the name of the switch *without the leading if*.

The inverse versions will set the `<switch>` to the logical opposite of the `<value>`.

Updated: 2022-01-15

---

<code>.meta:n</code>	<code>&lt;key&gt; .meta:n = {&lt;keyval list&gt;}</code>
----------------------	--

---

Updated: 2013-07-10 Makes `<key>` a meta-key, which will set `<keyval list>` in one go. The `<keyval list>` can refer as `#1` to the value given at the time the `<key>` is used (or, if no value is given, the `<key>`’s default value).

<b>.meta:nn</b>	<code>&lt;key&gt; .meta:nn = {&lt;path&gt;} {&lt;keyval list&gt;}</code>
New: 2013-07-10	Makes <code>&lt;key&gt;</code> a meta-key, which will set <code>&lt;keyval list&gt;</code> in one go using the <code>&lt;path&gt;</code> in place of the current one. The <code>&lt;keyval list&gt;</code> can refer as <code>#1</code> to the value given at the time the <code>&lt;key&gt;</code> is used (or, if no value is given, the <code>&lt;key&gt;</code> 's default value).
<b>.multichoice:</b>	<code>&lt;key&gt; .multichoice:</code>
New: 2011-08-21	Sets <code>&lt;key&gt;</code> to act as a multiple choice key. Each valid choice for <code>&lt;key&gt;</code> must then be created, as discussed in section <a href="#">27.3</a> .
<b>.multichoices:nn</b>	<code>&lt;key&gt; .multichoices:nn {&lt;choices&gt;} {&lt;code&gt;}</code>
<b>.multichoices:(Vn en on)</b>	Sets <code>&lt;key&gt;</code> to act as a multiple choice key, and defines a series <code>&lt;choices&gt;</code> which are implemented using the <code>&lt;code&gt;</code> . Inside <code>&lt;code&gt;</code> , <code>\l_keys_choice_tl</code> will be the name of the choice made, and <code>\l_keys_choice_int</code> will be the position of the choice in the list of <code>&lt;choices&gt;</code> (indexed from 1). Choices are discussed in detail in section <a href="#">27.3</a> .

---

New: 2015-07-14 Removes the definition of the `<key>` within the current `TEX` group.

---

---

<code>.value_forbidden:n</code>	<code>&lt;key&gt; .value_forbidden:n = true false</code>
---------------------------------	--

---

New: 2015-07-14 Specifies that `<key>` cannot receive a `<value>` when used. If a `<value>` is given then an error will be issued. Setting the property “`false`” cancels the restriction.

---

---

<code>.value_required:n</code>	<code>&lt;key&gt; .value_required:n = true false</code>
--------------------------------	---

---

New: 2015-07-14 Specifies that `<key>` must receive a `<value>` when used. If a `<value>` is not given then an error will be issued. Setting the property “`false`” cancels the restriction.

---

## 27.2 Sub-dividing keys

When creating large numbers of keys, it may be desirable to divide them into several subsets for a given module. This can be achieved either by adding a sub-division to the module name:

```
\keys_define:nn { mymodule / subset }
  { key .code:n = code }
```

or to the key name:

```
\keys_define:nn { mymodule }
  { subset / key .code:n = code }
```

As illustrated, the best choice of token for sub-dividing keys in this way is `/`. This is because of the method that is used to represent keys internally. Both of the above code fragments set the same key, which has full name `mymodule/subset/key`.

As illustrated in the next section, this subdivision is particularly relevant to making multiple choices.

## 27.3 Choice and multiple choice keys

The `l3keys` system supports two types of choice key, in which a series of pre-defined input values are linked to varying implementations. Choice keys are usually created so that the various values are mutually-exclusive: only one can apply at any one time. “Multiple” choice keys are also supported: these allow a selection of values to be chosen at the same time.

Mutually-exclusive choices are created by setting the `.choice:` property:

```
\keys_define:nn { mymodule }
{ key .choice: }
```

For keys which are set up as choices, the valid choices are generated by creating sub-keys of the choice key. This can be carried out in two ways.

In many cases, choices execute similar code which is dependent only on the name of the choice or the position of the choice in the list of all possibilities. Here, the keys can share the same code, and can be rapidly created using the `.choices:nn` property.

```
\keys_define:nn { mymodule }
{
  key .choices:nn =
    { choice-a, choice-b, choice-c }
    {
      You~gave~choice~'\tl_use:N \l_keys_choice_tl',~
      which~is~in~position~\int_use:N \l_keys_choice_int \c_space_tl
      in~the~list.
    }
}
```

The index `\l_keys_choice_int` in the list of choices starts at 1.

---

`\l_keys_choice_int`  
`\l_keys_choice_tl`

---

Inside the code block for a choice generated using `.choices:nn`, the variables `\l_keys_choice_tl` and `\l_keys_choice_int` are available to indicate the name of the current choice, and its position in the comma list. The position is indexed from 1. Note that, as with standard key code generated using `.code:n`, the value passed to the key (i.e., the choice name) is also available as `#1`.

On the other hand, it is sometimes useful to create choices which use entirely different code from one another. This can be achieved by setting the `.choice:` property of a key, then manually defining sub-keys.

```
\keys_define:nn { mymodule }
{
  key .choice:,
  key / choice-a .code:n = code-a,
  key / choice-b .code:n = code-b,
  key / choice-c .code:n = code-c,
}
```

It is possible to mix the two methods, but manually-created choices should *not* use `\l_keys_choice_tl` or `\l_keys_choice_int`. These variables do not have defined

behaviour when used outside of code created using `.choices:nn` (i.e., anything might happen).

It is possible to allow choice keys to take values which have not previously been defined by adding code for the special **unknown** choice. The general behavior of the **unknown** key is described in Section 27.6. A typical example in the case of a choice would be to issue a custom error message:

```
\keys_define:nn { mymodule }
{
  key .choice:,
  key / choice-a .code:n = code-a,
  key / choice-b .code:n = code-b,
  key / choice-c .code:n = code-c,
  key / unknown .code:n =
    \msg_error:nnee { mymodule } { unknown-choice }
    { key } % Name of choice key
    { choice-a , choice-b , choice-c } % Valid choices
    { \exp_not:n {#1} } % Invalid choice given
}
```

Multiple choices are created in a very similar manner to mutually-exclusive choices, using the properties `.multichoice:` and `.multichoice:nn`. As with mutually exclusive choices, multiple choices are defined as sub-keys. Thus both

```
\keys_define:nn { mymodule }
{
  key .multichoice:nn =
    { choice-a, choice-b, choice-c }
    {
      You~gave~choice~'\tl_use:N \l_keys_choice_tl',~
      which~is~in~position~
      \int_use:N \l_keys_choice_int \c_space_tl
      in~the~list.
    }
}
```

and

```
\keys_define:nn { mymodule }
{
  key .multichoice:,
  key / choice-a .code:n = code-a,
  key / choice-b .code:n = code-b,
  key / choice-c .code:n = code-c,
}
```

are valid.

When a multiple choice key is set

```
\keys_set:nn { mymodule }
{
  key = { a , b , c } % 'key' defined as a multiple choice
}
```

each choice is applied in turn, equivalent to a `clist` mapping or to applying each value individually:

```
\keys_set:nn { mymodule }
{
  key = a ,
  key = b ,
  key = c ,
}
```

Thus each separate choice will have passed to it the `\l_keys_choice_tl` and `\l_keys_choice_int` in exactly the same way as described for `.choices:nn`.

## 27.4 Key usage scope

Some keys will be used as settings which have a strictly limited scope of usage. Some will be only available once, others will only be valid until typesetting begins. To allow formats to support this in a structured way, `l3keys` allows this information to be specified using the `.usage:n` property.

<code>.usage:n</code>	<code>&lt;key&gt; .usage:n = &lt;scope&gt;</code>
New: 2022-01-10	Defines the <code>&lt;key&gt;</code> to have usage within the <code>&lt;scope&gt;</code> , which should be one of <code>general</code> , <code>preamble</code> or <code>load</code> .

<code>\l_keys_usage_load_prop</code> <code>\l_keys_usage_preamble_prop</code>
New: 2022-01-10

`l3keys` itself does *not* attempt to redefine keys based on the usage scope. Rather, this information is made available with these two property lists. These hold an entry for each module (prefix); the value of each entry is a comma-separated list of the usage-restricted key(s).

## 27.5 Setting keys

<code>\keys_set:nn</code> <code>\keys_set:(nV nv ne no)</code>	<code>\keys_set:nn {&lt;module&gt;} {&lt;keyval list&gt;}</code>
Updated: 2017-11-14	Parses the <code>&lt;keyval list&gt;</code> , and sets those keys which are defined for <code>&lt;module&gt;</code> . The behaviour on finding an unknown key can be set by defining a special <code>unknown</code> key: this is illustrated later.

<code>\l_keys_path_str</code>	For each key processed, information of the full <i>path</i> of the key, the <i>name</i> of the key and
<code>\l_keys_key_str</code>	the <i>value</i> of the key is available within two string and one token list variables. These
<code>\l_keys_value_tl</code>	may be used within the code of the key.
Updated: 2020-02-08	The <i>path</i> of the key is a “full” description of the key, and is unique for each key. It consists of the module and full key name, thus for example

```
\keys_set:nn { mymodule } { key-a = some-value }
```

has path `mymodule/key-a` while

```
\keys_set:nn { mymodule } { subset / key-a = some-value }
```

has path `mymodule/subset/key-a`. This information is stored in `\l_keys_path_str`.

The *name* of the key is the part of the path after the last `/`, and thus is not unique. In the preceding examples, both keys have name `key-a` despite having different paths. This information is stored in `\l_keys_key_str`.

The *value* is everything after the `=`, which may be empty if no value was given. This is stored in `\l_keys_value_tl`, and is not processed in any way by `\keys_set:nn`.

## 27.6 Handling of unknown keys

If a key has not previously been defined (is unknown), `\keys_set:nn` looks for a special `unknown` key for the same module, and if this is not defined raises an error indicating that the key name was unknown. This mechanism can be used for example to issue custom error texts. The `unknown` key also supports the `.default:n` property.

```
\keys_define:nn { mymodule }
{
  unknown .code:n =
    You~tried~to~set~key~'\l_keys_key_str'~to~'#1' . ,
    unknown .default:V = \c_novalue_tl
}
```

Key inheritance does *not* include looking for the special `unknown` key. Handling of `unknown` keys should be set up explicitly for each path where it applies.

## 27.7 Selective key setting

In some cases it may be useful to be able to select only some keys for setting, even though these keys have the same path. For example, with a set of keys defined using

```
\keys_define:nn { mymodule }
{
  key-one .code:n = { \my_func:n {#1} } ,
  key-two .tl_set:N = \l_my_a_tl ,
  key-three .tl_set:N = \l_my_b_tl ,
  key-four .fp_set:N = \l_my_a_fp ,
}
```

the use of `\keys_set:nn` attempts to set all four keys. However, in some contexts it may only be sensible to set some keys, or to control the order of setting. To do this, keys may be assigned to *groups*: arbitrary sets which are independent of the key tree. Thus modifying the example to read

```
\keys_define:nn { mymodule }
{
  key-one   .code:n   = { \my_func:n {#1} } ,
  key-one   .groups:n = { first }           ,
  key-two   .tl_set:N = \l_my_a_tl          ,
  key-two   .groups:n = { first }           ,
  key-three .tl_set:N = \l_my_b_tl          ,
  key-three .groups:n = { second }          ,
  key-four  .fp_set:N = \l_my_a_fp          ,
}
```

assigns `key-one` and `key-two` to group `first`, `key-three` to group `second`, while `key-four` is not assigned to a group.

Selective key setting may be achieved either by selecting one or more groups to be made “active”, or by marking one or more groups to be ignored in key setting.

Updated: 2019-01-29

---

These functions set keys which are known for the `<module>`, and simply ignore other keys. The `\keys_set_known:nn` function parses the `<keyval list>`, and sets those keys which are defined for `<module>`. Any keys which are unknown are not processed further by the parser.

In addition, `\keys_set_known:nnN` and `\keys_set_known:nnnN` store the key–value pairs for unknown keys in the `<tl var>` in comma-separated form (i.e., an edited version of the `<keyval list>`). When a `<root>` is given (`\keys_set_known:nnnN`), the key–value entries are returned relative to this point in the key tree. When it is absent, only the key name and value are provided. The correct list is returned by nested calls.

These functions activate key selection in an “opt-in” sense: only keys assigned to one or more of the `<groups>` specified are set. The `<groups>` are given as a comma-separated list. Unknown keys are not assigned to any group and are thus never set.

In addition, `\keys_set_groups:nnnN` and `\keys_set_groups:nnnnN` store the key-value pairs for skipped keys in the `<t1 var>` in comma-separated form (i.e., an edited version of the `<keyval list>`). When a `<root>` is given (`\keys_set_groups:nnnnN`), the key-value entries are returned relative to this point in the key tree. When it is absent, only the key name and value are provided. The correct list is returned by nested calls.

---

<code>\keys_set_exclude_groups:nnn</code>	<code>\keys_set_exclude_groups:nnn {&lt;module&gt;} {&lt;groups&gt;} {&lt;keyval list&gt;}</code>
<code>\keys_set_exclude_groups:(nnV nnv nno)</code>	<code>\keys_set_exclude_groups:nnnN {&lt;module&gt;} {&lt;groups&gt;} {&lt;keyval</code>
<code>\keys_set_exclude_groups:nnnN</code>	<code>list&gt;} &lt;t1 var&gt;</code>
<code>\keys_set_exclude_groups:(nnVN nnvN nnoN)</code>	<code>\keys_set_exclude_groups:nnnnN {&lt;module&gt;} {&lt;groups&gt;} {&lt;keyval</code>
<code>\keys_set_exclude_groups:nnnnN</code>	<code>list&gt;} {&lt;root&gt;} &lt;t1 var&gt;</code>
<code>\keys_set_exclude_groups:(nnVnN nnvnN nnonN)</code>

---

These functions activate key selection in an “opt-out” sense: keys assigned to one or more of the `<groups>` specified are *not* set. The `<groups>` are given as a comma-separated list. Unknown keys are not assigned to any group and are thus always set.

In addition, `\keys_set_exclude_groups:nnnN` and `\keys_set_exclude_groups:nnnnN` store the key-value pairs for skipped keys in the `<t1 var>` in comma-separated form (i.e., an edited version of the `<keyval list>`). When a `<root>` is given (`\keys_set_exclude_groups:nnnnN`), the key-value entries are returned relative to this point in the key tree. When it is absent, only the key name and value are provided. The correct list is returned by nested calls.

## 27.8 Precompiling keys

---

<code>\keys_precompile:nnN</code>	<code>\keys_precompile:nnN {&lt;module&gt;} {&lt;keyval list&gt;} &lt;t1 var&gt;</code>
-----------------------------------	---

---

New: 2022-03-09

---

Parses the `<keyval list>` as for `\keys_set:nn`, placing the resulting code for those which set variables or functions into the `<t1 var>`. Thus this function “precompiles” the keyval list into a set of results which can be applied rapidly.

It is important to note that when precompiling keys, no expansion of variables takes place. This means that any key setting which simply stores variable names, rather than variable values, may not work correctly. Most notably, any key setting which uses key status variables (`\l_keys_key_str`, etc.) will yield unpredictable outcomes. As such, keys intended to be precompiled should fully expand any values at the point of setting.

## 27.9 Utility functions for keys

---

```
\keys_if_exist_p:nn * \keys_if_exist_p:nn {<module>} {<key>}
\keys_if_exist_p:ne * \keys_if_exist:nnTF {<module>} {<key>} {<true code>} {<false code>}
\keys_if_exist:nnTF * Tests if the <key> exists for <module>, i.e., if any code has been defined for <key>.
\keys_if_exist:neTF *
```

---

Updated: 2022-01-10

---

---

```
\keys_if_choice_exist_p:nnn * \keys_if_choice_exist_p:nnn {<module>} {<key>} {<choice>}
\keys_if_choice_exist:nnnTF * \keys_if_choice_exist:nnnTF {<module>} {<key>} {<choice>} {<true code>} {<false
code>}
```

---

New: 2011-08-21

Updated: 2017-11-14

---

Tests if the `<choice>` is defined for the `<key>` within the `<module>`, i.e., if any code has been defined for `<key>/<choice>`. The test is `false` if the `<key>` itself is not defined.

---

```
\keys_show:nn \keys_show:nn {<module>} {<key>}
```

---

Updated: 2015-08-09 Displays in the terminal the information associated to the `<key>` for a `<module>`, including the function which is used to actually implement it.

---

---

```
\keys_log:nn \keys_log:nn {<module>} {<key>}
```

---

New: 2014-08-22 Writes in the log file the information associated to the `<key>` for a `<module>`. See also  
Updated: 2015-08-09 `\keys_show:nn` which displays the result in the terminal.

---

## 27.10 Low-level interface for parsing key–val lists

To re-cap from earlier, a key–value list is input of the form

```
KeyOne = ValueOne ,
KeyTwo = ValueTwo ,
KeyThree
```

where each key–value pair is separated by a comma from the rest of the list, and each key–value pair does not necessarily contain an equals sign or a value! Processing this type of input correctly requires a number of careful steps, to correctly account for braces, spaces and the category codes of separators.

While the functions described earlier are used as a high-level interface for processing such input, in special circumstances you may wish to use a lower-level approach. The low-level parsing system converts a `<key-value list>` into `<keys>` and associated `<values>`. After the parsing phase is completed, the resulting keys and values (or keys alone) are available for further processing. This processing is not carried out by the low-level parser itself, and so the parser requires the names of two functions along with the key–value list. One function is needed to process key–value pairs (it receives two arguments), and a second function is required for keys given without any value (it is called with a single argument).

The parser does not double `#` tokens or expand any input. Active tokens `=` and `,` appearing at the outer level of braces are converted to category “other” (12) so that the

parser does not “miss” any due to category code changes. Spaces are removed from the ends of the keys and values. Keys and values which are given in braces have exactly one set removed (after space trimming), thus

```
key = {value here},
```

and

```
key = value here,
```

are treated identically.

<code>\keyval_parse:nnn</code>	☆	<code>\keyval_parse:nnn {&lt;code<sub>1</sub>&gt;} {&lt;code<sub>2</sub>&gt;} {&lt;key-value list&gt;}</code>
<code>\keyval_parse:(nnV nnv)</code>	☆	Parses the <code>&lt;key-value list&gt;</code> into a series of <code>&lt;keys&gt;</code> and associated <code>&lt;values&gt;</code> , or keys alone (if no <code>&lt;value&gt;</code> was given). <code>&lt;code<sub>1</sub>&gt;</code> receives each <code>&lt;key&gt;</code> (with no <code>&lt;value&gt;</code> ) as a trailing brace group, whereas <code>&lt;code<sub>2</sub>&gt;</code> is appended by two brace groups, the <code>&lt;key&gt;</code> and <code>&lt;value&gt;</code> . The order of the <code>&lt;keys&gt;</code> in the <code>&lt;key-value list&gt;</code> is preserved. Thus
New: 2020-12-19		
Updated: 2021-05-10		

```
\keyval_parse:nnn
{ \use_none:nn { code 1 } }
{ \use_none:nnn { code 2 } }
{ key1 = value1 , key2 = value2, key3 = , key4 }
```

is converted into an input stream

```
\use_none:nnn { code 2 } { key1 } { value1 }
\use_none:nnn { code 2 } { key2 } { value2 }
\use_none:nnn { code 2 } { key3 } { }
\use_none:nn { code 1 } { key4 }
```

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the `<key>` and `<value>`, then one *outer* set of braces is removed from the `<key>` and `<value>` as part of the processing. If you need exactly the output shown above, you’ll need to either **e**-type or **x**-type expand the function.

**T<sub>E</sub>Xhackers note:** The result of each list element is returned within `\exp_not:n`, which means that the converted input stream does not expand further when appearing in an **e**-type or **x**-type argument expansion.

<code>\keyval_parse:NNn</code>	☆	<code>\keyval_parse:NNn &lt;function<sub>1</sub>&gt; &lt;function<sub>2</sub>&gt; {&lt;key-value list&gt;}</code>
<code>\keyval_parse:(NNV NNv)</code>	☆	Parses the <code>&lt;key-value list&gt;</code> into a series of <code>&lt;keys&gt;</code> and associated <code>&lt;values&gt;</code> , or keys alone (if no <code>&lt;value&gt;</code> was given). <code>&lt;function<sub>1</sub>&gt;</code> should take one argument, while <code>&lt;function<sub>2</sub>&gt;</code> should absorb two arguments. After <code>\keyval_parse:NNn</code> has parsed the <code>&lt;key-value list&gt;</code> , <code>&lt;function<sub>1</sub>&gt;</code> is used to process keys given with no value and <code>&lt;function<sub>2</sub>&gt;</code> is used to process keys given with a value. The order of the <code>&lt;keys&gt;</code> in the <code>&lt;key-value list&gt;</code> is preserved. Thus

Updated: 2021-05-10

```
\keyval_parse:NNn \function:n \function:nn
{ key1 = value1 , key2 = value2, key3 = , key4 }
```

is converted into an input stream

```
\function:nn { key1 } { value1 }
\function:nn { key2 } { value2 }
\function:nn { key3 } { }
\function:n { key4 }
```

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the `<key>` and `<value>`, then one *outer* set of braces is removed from the `<key>` and `<value>` as part of the processing.

This shares the implementation of `\keyval_parse:nnn`, the difference is only semantically.

**TeXhackers note:** The result is returned within `\exp_not:n`, which means that the converted input stream does not expand further when appearing in an **e**-type or **x**-type argument expansion.

## Chapter 28

# The `l3intarray` module

## Fast global integer arrays

For applications requiring heavy use of integers, this module provides arrays which can be accessed in constant time (contrast `l3seq`, where access time is linear). These arrays have several important features

- The size of the array is fixed and must be given at point of initialisation
- The absolute value of each entry has maximum  $2^{30} - 1$  (i.e., one power lower than the usual `\c_max_int` ceiling of  $2^{31} - 1$ )

The use of `intarray` data is therefore recommended for cases where the need for fast access is of paramount importance.

### 28.1 Creating and initialising integer array variables

---

<code>\intarray_new:Nn</code>	<code>\intarray_new:Nn</code>	<code>\intarray var</code>	<code>{\size}</code>
<code>\intarray_new:cn</code>	Evaluates the integer expression <code>\size</code> and allocates an <i>integer array variable</i>		
<small>New: 2018-03-29</small>	with that number of (zero) entries. The variable name should start with <code>\g_</code> because assignments are always global.		

---

---

<code>\intarray_const_from_clist:Nn</code>	<code>\intarray_const_from_clist:Nn</code>	<code>\intarray var</code>	<code>{\int expr clist}</code>
<code>\intarray_const_from_clist:cn</code>	Creates a new constant <i>integer array variable</i> or raises an error if the name is already taken. The <i>integer array variable</i> is set (globally) to contain as its items the results of evaluating each <i>integer expression</i> in the <i>comma list</i> .		
<small>New: 2018-05-04</small>			

---

---

<code>\intarray_gzero:N</code>	<code>\intarray_gzero:N</code>	<code>\intarray var</code>	
<code>\intarray_gzero:c</code>	Sets all entries of the <i>integer array variable</i> to zero. Assignments are always global.		
<small>New: 2018-05-04</small>			

---

## 28.2 Adding data to integer arrays

<hr/>	<code>\intarray_gset:Nnn</code>	<code>\intarray_gset:Nnn &lt;intarray var&gt; {(position)} {(value)}</code>
<hr/>	<code>\intarray_gset:cnn</code>	Stores the result of evaluating the integer expression <code>&lt;value&gt;</code> into the <code>&lt;integer array variable&gt;</code> at the (integer expression) <code>&lt;position&gt;</code> . If the <code>&lt;position&gt;</code> is not between 1 and the <code>\intarray_count:N</code> , or the <code>&lt;value&gt;</code> 's absolute value is bigger than $2^{30} - 1$ , an error occurs. Assignments are always global.
<hr/>	New: 2018-03-29	

## 28.3 Counting entries in integer arrays

<hr/>	<code>\intarray_count:N</code>	<code>\intarray_count:N &lt;intarray var&gt;</code>
<hr/>	<code>\intarray_count:c</code>	Expands to the number of entries in the <code>&lt;integer array variable&gt;</code> . Contrarily to <code>\seq_count:N</code> this is performed in constant time.
<hr/>	New: 2018-03-29	

## 28.4 Using a single entry

<hr/>	<code>\intarray_item:Nn</code>	<code>\intarray_item:Nn &lt;intarray var&gt; {(position)}</code>
<hr/>	<code>\intarray_item:cn</code>	Expands to the integer entry stored at the (integer expression) <code>&lt;position&gt;</code> in the <code>&lt;integer array variable&gt;</code> . If the <code>&lt;position&gt;</code> is not between 1 and the <code>\intarray_count:N</code> , an error occurs.
<hr/>	New: 2018-03-29	

<hr/>	<code>\intarray_rand_item:N</code>	<code>\intarray_rand_item:N &lt;intarray var&gt;</code>
<hr/>	<code>\intarray_rand_item:c</code>	Selects a pseudo-random item of the <code>&lt;integer array&gt;</code> . If the <code>&lt;integer array&gt;</code> is empty, produce an error.
<hr/>	New: 2018-05-05	

## 28.5 Integer array conditional

<hr/>	<code>\intarray_if_exist_p:N</code>	<code>\intarray_if_exist_p:N &lt;intarray var&gt;</code>
<hr/>	<code>\intarray_if_exist_p:c</code>	<code>\intarray_if_exist:NTF &lt;intarray var&gt; {(true code)} {(false code)}</code>
<hr/>	<code>\intarray_if_exist:NTF</code>	Tests whether the <code>&lt;intarray var&gt;</code> is currently defined. This does not check that the
<hr/>	<code>\intarray_if_exist:CTF</code>	<code>&lt;intarray var&gt;</code> really is an integer array variable.
<hr/>	New: 2024-03-31	

## 28.6 Viewing integer arrays

<hr/>	<code>\intarray_show:N</code>	<code>\intarray_show:N &lt;intarray var&gt;</code>
<hr/>	<code>\intarray_show:c</code>	<code>\intarray_log:N &lt;intarray var&gt;</code>
<hr/>	<code>\intarray_log:N</code>	Displays the items in the <code>&lt;integer array variable&gt;</code> in the terminal or writes them in
<hr/>	<code>\intarray_log:c</code>	the log file.
<hr/>	New: 2018-05-04	

## 28.7 Implementation notes

It is a wrapper around the `\fontdimen` primitive, used to store arrays of integers (with a restricted range: absolute value at most  $2^{30} - 1$ ). In contrast to `l3seq` sequences the access to individual entries is done in constant time rather than linear time, but only integers can be stored. More precisely, the primitive `\fontdimen` stores dimensions but the `l3intarray` module transparently converts these from/to integers. Assignments are always global.

While LuaTeX's memory is extensible, other engines can “only” deal with a bit less than  $4 \times 10^6$  entries in all `\fontdimen` arrays combined (with default TeX Live settings).

## Chapter 29

# The `l3fp` module

## Floating points

A decimal floating point number is one which is stored as a significand and a separate exponent. The module implements expandably a wide set of arithmetic, trigonometric, and other operations on decimal floating point numbers, to be used within floating point expressions. *Floating point expressions* (“`<fp expr>`”) support the following operations with their usual precedence.

- Basic arithmetic: addition  $x + y$ , subtraction  $x - y$ , multiplication  $x * y$ , division  $x / y$ , square root  $\sqrt{x}$ , and parentheses.
- Comparison operators:  $x < y$ ,  $x \leq y$ ,  $x > y$ ,  $x \neq y$  etc.
- Boolean logic: sign `sign  $x$` , negation `! $x$` , conjunction  `$x$  &&  $y$` , disjunction  `$x$  ||  $y$` , ternary operator  `$x$  ?  $y$  :  $z$` .
- Exponentials: `exp  $x$` , `ln  $x$` ,  `$x$  $y$` , `logb  $x$` .
- Integer factorial: `fact  $x$` .
- Trigonometry: `sin  $x$` , `cos  $x$` , `tan  $x$` , `cot  $x$` , `sec  $x$` , `csc  $x$`  expecting their arguments in radians, and `sind  $x$` , `cosd  $x$` , `tand  $x$` , `cotd  $x$` , `secd  $x$` , `cscd  $x$`  expecting their arguments in degrees.
- Inverse trigonometric functions: `asin  $x$` , `acos  $x$` , `atan  $x$` , `acot  $x$` , `asec  $x$` , `acsc  $x$`  giving a result in radians, and `asind  $x$` , `acosd  $x$` , `atand  $x$` , `acotd  $x$` , `asecd  $x$` , `acscd  $x$`  giving a result in degrees.
- (not yet) Hyperbolic functions and their inverse functions: `sinh  $x$` , `cosh  $x$` , `tanh  $x$` , `coth  $x$` , `sech  $x$` , `csch`, and `asinh  $x$` , `acosh  $x$` , `atanh  $x$` , `acoth  $x$` , `asech  $x$` , `acsch  $x$` .
- Extrema: `max( $x_1, x_2, \dots$ )`, `min( $x_1, x_2, \dots$ )`, `abs( $x$ )`.
- Rounding functions, controlled by two optional values,  $n$  (number of places, 0 by default) and  $t$  (behavior on a tie, `nan` by default):
  - `trunc( $x, n$ )` rounds towards zero,
  - `floor( $x, n$ )` rounds towards  $-\infty$ ,

- `ceil( $x, n$ )` rounds towards  $+\infty$ ,
- `round( $x, n, t$ )` rounds to the closest value, with ties rounded to an even value by default, towards zero if  $t = 0$ , towards  $+\infty$  if  $t > 0$  and towards  $-\infty$  if  $t < 0$ .

And (*not yet*) modulo, and “quantize”.

- Random numbers: `rand()`, `randint( $m, n$ )`.
- Constants: `pi`, `deg` (one degree in radians).
- Dimensions, automatically expressed in points, *e.g.*, `pc` is 12.
- Automatic conversion (no need for `\langle type \rangle\_use:N`) of integer, dimension, and skip variables to floating point numbers, expressing dimensions in points and ignoring the stretch and shrink components of skips.
- Tuples:  $(x_1, \dots, x_n)$  that can be stored in variables, added together, multiplied or divided by a floating point number, and nested.

Floating point numbers can be given either explicitly (in a form such as `1.234e-34`, or `-.0001`), or as a stored floating point variable, which is automatically replaced by its current value. A “floating point” is a floating point number or a tuple thereof. See section 29.12.1 for a description of what a floating point is, section 29.12.2 for details about how an expression is parsed, and section 29.12.3 to know what the various operations do. Some operations may raise exceptions (error messages), described in section 29.10.

An example of use could be the following.

```
\LaTeX{} can now compute: $ \frac{\sin (3.5)}{2} + 2\cdot 10^{-3}
= \ExplSyntaxOn \fp_to_decimal:n {\sin(3.5)/2 + 2e-3} $.
```

The operation `round` can be used to limit the result’s precision. Adding `+0` avoids the possibly undesirable output `-0`, replacing it by `+0`. However, the `l3fp` module is mostly meant as an underlying tool for higher-level commands. For example, one could provide a function to typeset nicely the result of floating point computations.

```
\documentclass{article}
\usepackage{siunitx}
\ExplSyntaxOn
\NewDocumentCommand { \calcnun } { m }
{ \num { \fp_to_scientific:n {#1} } }
\ExplSyntaxOff
\begin{document}
\calcnun { 2 pi * sin ( 2.3 ^ 5 ) }
\end{document}
```

See the documentation of `siunitx` for various options of `\num`.

## 29.1 Creating and initialising floating point variables

<hr/>	
<code>\fp_new:N</code>	<code>\fp_new:N &lt;fp var&gt;</code>
<code>\fp_new:c</code>	Creates a new <code>&lt;fp var&gt;</code> or raises an error if the name is already taken. The declaration
Updated: 2012-05-08	is global. The <code>&lt;fp var&gt;</code> is initially +0.
<hr/>	
<code>\fp_const:Nn</code>	<code>\fp_const:Nn &lt;fp var&gt; {&lt;fp expr&gt;}</code>
<code>\fp_const:cn</code>	Creates a new constant <code>&lt;fp var&gt;</code> or raises an error if the name is already taken. The
Updated: 2012-05-08	<code>&lt;fp var&gt;</code> is set globally equal to the result of evaluating the <code>&lt;fp expr&gt;</code> .
<hr/>

<hr/>	
<code>\fp_set_eq:NN</code>	<code>\fp_set_eq:NN &lt;fp var<sub>12</sub></code>
<code>\fp_set_eq:(cn Nc cc)</code>	Sets the floating point variable <code>&lt;fp var<sub>1 equal to the current value of <code>&lt;fp var<sub>2.</sub></code></sub></code>
<code>\fp_gset_eq:NN</code>	
<code>\fp_gset_eq:(cn Nc cc)</code>	
Updated: 2012-05-08	
<hr/>	
<code>\fp_add:Nn</code>	<code>\fp_add:Nn &lt;fp var&gt; {&lt;fp expr&gt;}</code>
<code>\fp_add:cn</code>	Adds the result of computing the <code>&lt;fp expr&gt;</code> to the <code>&lt;fp var&gt;</code> . This also applies if
<code>\fp_gadd:Nn</code>	<code>&lt;fp var&gt;</code> and <code>&lt;floating point expression&gt;</code> evaluate to tuples of the same size.
<code>\fp_gadd:cn</code>	
Updated: 2012-05-08	

---

<code>\fp_sub:Nn</code>	<code>\fp_sub:Nn &lt;fp var&gt; {(fp expr)}</code>
<code>\fp_sub:cn</code>	Subtracts the result of computing the <i>&lt;floating point expression&gt;</i> from the <i>&lt;fp var&gt;</i> .
<code>\fp_gsub:Nn</code>	This also applies if <i>&lt;fp var&gt;</i> and <i>&lt;floating point expression&gt;</i> evaluate to tuples of
<code>\fp_gsub:cn</code>	the same size.
<hr/> Updated: 2012-05-08 <hr/>	

## 29.3 Using floating points

---

<code>\fp_eval:n</code>	<code>\fp_eval:n {(fp expr)}</code>
New: 2012-05-08	Evaluates the <i>&lt;fp expr&gt;</i> and expresses the result as a decimal number with no exponent.
Updated: 2012-07-08	Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values $\pm\infty$ and <code>nan</code> trigger an “invalid operation” exception. For a tuple, each item is converted using <code>\fp_eval:n</code> and they are combined as $(\langle fp_1 \rangle, \sqcup \langle fp_2 \rangle, \sqcup \dots \langle fp_n \rangle)$ if $n > 1$ and $(\langle fp_1 \rangle, )$ or $()$ for fewer items. This function is identical to <code>\fp_to_decimal:n</code> .

---

---

<code>\fp_sign:n</code>	<code>\fp_sign:n {(fp expr)}</code>
New: 2018-11-03	Evaluates the <i>&lt;fp expr&gt;</i> and leaves its sign in the input stream using <code>\fp_eval:n {sign(&lt;result&gt;)}</code> : +1 for positive numbers and for $+\infty$ , -1 for negative numbers and for $-\infty$ , $\pm 0$ for $\pm 0$ . If the operand is a tuple or is <code>nan</code> , then “invalid operation” occurs and the result is 0.

---

---

<code>\fp_to_decimal:N</code>	<code>\fp_to_decimal:N &lt;fp var&gt;</code>
<code>\fp_to_decimal:c</code>	<code>\fp_to_decimal:n {(fp expr)}</code>
<code>\fp_to_decimal:n</code>	Evaluates the <i>&lt;fp expr&gt;</i> and expresses the result as a decimal number with no exponent.
New: 2012-05-08	Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values $\pm\infty$ and <code>nan</code> trigger an “invalid operation” exception. For a tuple, each item is converted using <code>\fp_to_decimal:n</code> and they are combined as $(\langle fp_1 \rangle, \sqcup \langle fp_2 \rangle, \sqcup \dots \langle fp_n \rangle)$ if $n > 1$ and $(\langle fp_1 \rangle, )$ or $()$ for fewer items.
Updated: 2012-07-08	

---

---

<code>\fp_to_dim:N</code>	<code>\fp_to_dim:N &lt;fp var&gt;</code>
<code>\fp_to_dim:c</code>	<code>\fp_to_dim:n {(fp expr)}</code>
<code>\fp_to_dim:n</code>	Evaluates the <i>&lt;fp expr&gt;</i> and expresses the result as a dimension (in pt) suitable for use in dimension expressions. The output is identical to <code>\fp_to_decimal:n</code> , with an additional trailing <code>pt</code> (both letter tokens). In particular, the result may be outside the range $[-2^{14} + 2^{-17}, 2^{14} - 2^{-17}]$ of valid T <sub>E</sub> X dimensions, leading to overflow errors if used as a dimension. Tuples, as well as the values $\pm\infty$ and <code>nan</code> , trigger an “invalid operation” exception.
Updated: 2016-03-22	

---

---

<code>\fp_to_int:N</code>	<code>\fp_to_int:N &lt;fp var&gt;</code>
<code>\fp_to_int:c</code>	<code>\fp_to_int:n {(fp expr)}</code>
<code>\fp_to_int:n</code>	Evaluates the <i>&lt;fp expr&gt;</i> , and rounds the result to the closest integer, rounding exact ties to an even integer. The result may be outside the range $[-2^{31} + 1, 2^{31} - 1]$ of valid T <sub>E</sub> X integers, leading to overflow errors if used in an integer expression. Tuples, as well as the values $\pm\infty$ and <code>nan</code> , trigger an “invalid operation” exception.

<code>\fp_to_scientific:c</code>	★	<code>\fp_to_scientific:n {&lt;fp expr&gt;}</code>
<code>\fp_to_scientific:n</code>	★	Evaluates the <code>&lt;fp expr&gt;</code> and expresses the result in scientific notation:

---

New: 2012-05-08  
Updated: 2016-03-22

`<optional -><digit>.<15 digits>e<optional sign><exponent>`

---

The leading `<digit>` is non-zero except in the case of  $\pm 0$ . The values  $\pm\infty$  and `nan` trigger an “invalid operation” exception. Normal category codes apply: thus the `e` is category code 11 (a letter). For a tuple, each item is converted using `\fp_to_scientific:n` and they are combined as `(<fp1>,␣<fp2>,␣...<fpn>)` if  $n > 1$  and `(<fp1>,)` or `()` for fewer items.

---

<code>\fp_to_tl:N</code>	★	<code>\fp_to_tl:N &lt;fp var&gt;</code>
<code>\fp_to_tl:c</code>	★	<code>\fp_to_tl:n {&lt;fp expr&gt;}</code>
<code>\fp_to_tl:n</code>	★	Evaluates the <code>&lt;fp expr&gt;</code> and expresses the result in (almost) the shortest possible form.

---

Updated: 2016-03-22

Numbers in the ranges  $(0, 10^{-3})$  and  $[10^{16}, \infty)$  are expressed in scientific notation with trailing zeros trimmed and no decimal separator when there is a single significant digit (this differs from `\fp_to_scientific:n`). Numbers in the range  $[10^{-3}, 10^{16})$  are expressed in a decimal notation without exponent, with trailing zeros trimmed, and no decimal separator for integer values (see `\fp_to_decimal:n`). Negative numbers start with `-`. The special values  $\pm 0$ ,  $\pm\infty$  and `nan` are rendered as `0`, `-0`, `inf`, `-inf`, and `nan` respectively. Normal category codes apply and thus `inf` or `nan`, if produced, are made up of letters. For a tuple, each item is converted using `\fp_to_tl:n` and they are combined as `(<fp1>,␣<fp2>,␣...<fpn>)` if  $n > 1$  and `(<fp1>,)` or `()` for fewer items.

---

<code>\fp_use:N</code>	★	<code>\fp_use:N &lt;fp var&gt;</code>
<code>\fp_use:c</code>	★	Inserts the value of the <code>&lt;fp var&gt;</code> into the input stream as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed. Integers are expressed without a decimal separator.

---

Updated: 2012-07-08

The values  $\pm\infty$  and `nan` trigger an “invalid operation” exception. For a tuple, each item is converted using `\fp_to_decimal:n` and they are combined as `(<fp1>,␣<fp2>,␣...<fpn>)` if  $n > 1$  and `(<fp1>,)` or `()` for fewer items. This function is identical to `\fp_to_decimal:N`.

## 29.4 Floating point conditionals

---

<code>\fp_if_exist_p:N</code>	★	<code>\fp_if_exist_p:N &lt;fp var&gt;</code>
<code>\fp_if_exist_p:c</code>	★	<code>\fp_if_exist:NTF &lt;fp var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<code>\fp_if_exist:N<math>\overline{TF}</math></code>	★	Tests whether the <code>&lt;fp var&gt;</code> is currently defined. This does not check that the <code>&lt;fp var&gt;</code> really is a floating point variable.

```

\fp_compare_p:nNn * \fp_compare_p:nNn {<fp expr1>} <relation> {<fp expr2>}
\fp_compare:nNnTF * \fp_compare:nNnTF {<fp expr1>} <relation> {<fp expr2>} {<true code>} {<false code>}

```

---

Updated: 2012-05-08

Compares the  $\langle fp\ expr_1 \rangle$  and the  $\langle fp\ expr_2 \rangle$ , and returns **true** if the  $\langle relation \rangle$  is obeyed. Two floating points  $x$  and  $y$  may obey four mutually exclusive relations:  $x < y$ ,  $x = y$ ,  $x > y$ , or  $x?y$  (“not ordered”). The last case occurs exactly if one or both operands is **nan** or is a tuple, unless they are equal tuples. Note that a **nan** is distinct from any value, even another **nan**, hence  $x = x$  is not true for a **nan**. To test if a value is **nan**, compare it to an arbitrary number with the “not ordered” relation.

```

\fp_compare:nNnTF { <value> } ? { 0 }
{ } % <value> is nan
{ } % <value> is not nan

```

Tuples are equal if they have the same number of items and items compare equal (in particular there must be no **nan**). At present any other comparison with tuples yields ? (not ordered). This is experimental.

This function is less flexible than `\fp_compare:nTF` but slightly faster. It is provided for consistency with `\int_compare:nNnTF` and `\dim_compare:nNnTF`.

---

$\backslash\text{fp\_compare\_p:n}$ $\star$ $\backslash\text{fp\_compare:nTF}$ $\star$	$\backslash\text{fp\_compare\_p:n}$ $\{$ $\langle\text{fp expr}_1\rangle \langle\text{relation}_1\rangle$ $\dots$ $\langle\text{fp expr}_N\rangle \langle\text{relation}_N\rangle$ $\langle\text{fp expr}_{N+1}\rangle$ $\}$ $\backslash\text{fp\_compare:nTF}$ $\{$ $\langle\text{fp expr}_1\rangle \langle\text{relation}_1\rangle$ $\dots$ $\langle\text{fp expr}_N\rangle \langle\text{relation}_N\rangle$ $\langle\text{fp expr}_{N+1}\rangle$ $\}$ $\{\langle\text{true code}\rangle\} \{\langle\text{false code}\rangle\}$
---	---

---

Updated: 2013-12-14

Evaluates the  $\langle\text{fp exprs}\rangle$  as described for  $\backslash\text{fp\_eval:n}$  and compares consecutive result using the corresponding  $\langle\text{relation}\rangle$ , namely it compares  $\langle\text{fp expr}_1\rangle$  and  $\langle\text{fp expr}_2\rangle$  using the  $\langle\text{relation}_1\rangle$ , then  $\langle\text{fp expr}_2\rangle$  and  $\langle\text{fp expr}_3\rangle$  using the  $\langle\text{relation}_2\rangle$ , until finally comparing  $\langle\text{fp expr}_N\rangle$  and  $\langle\text{fp expr}_{N+1}\rangle$  using the  $\langle\text{relation}_N\rangle$ . The test yields **true** if all comparisons are **true**. Each  $\langle\text{floating point expression}\rangle$  is evaluated only once. Contrarily to  $\backslash\text{int\_compare:nTF}$ , all  $\langle\text{fp exprs}\rangle$  are computed, even if one comparison is **false**. Two floating points  $x$  and  $y$  may obey four mutually exclusive relations:  $x < y$ ,  $x = y$ ,  $x > y$ , or  $x?y$  (“not ordered”). The last case occurs exactly if one or both operands is **nan** or is a tuple, unless they are equal tuples. Each  $\langle\text{relation}\rangle$  can be any (non-empty) combination of  $<$ ,  $=$ ,  $>$ , and  $?$ , plus an optional leading  $!$  (which negates the  $\langle\text{relation}\rangle$ ), with the restriction that the  $\langle\text{relation}\rangle$  may not start with  $?$ , as this symbol has a different meaning (in combination with  $:$ ) within floating point expressions. The comparison  $x \langle\text{relation}\rangle y$  is then **true** if the  $\langle\text{relation}\rangle$  does not start with  $!$  and the actual relation ( $<$ ,  $=$ ,  $>$ , or  $?$ ) between  $x$  and  $y$  appears within the  $\langle\text{relation}\rangle$ , or on the contrary if the  $\langle\text{relation}\rangle$  starts with  $!$  and the relation between  $x$  and  $y$  does not appear within the  $\langle\text{relation}\rangle$ . Common choices of  $\langle\text{relation}\rangle$  include  $\geq$  (greater or equal),  $\neq$  (not equal),  $!?$  or  $\leq\geq$  (comparable).

This function is more flexible than  $\backslash\text{fp\_compare:nNnTF}$  and only slightly slower.

---

$\backslash\text{fp\_if\_nan\_p:n}$ $\star$ $\backslash\text{fp\_if\_nan:nTF}$ $\star$	$\backslash\text{fp\_if\_nan\_p:n} \{\langle\text{fp expr}\rangle\}$ $\backslash\text{fp\_if\_nan:nTF} \{\langle\text{fp expr}\rangle\} \{\langle\text{true code}\rangle\} \{\langle\text{false code}\rangle\}$
---	--

---

New: 2019-08-25

Evaluates the  $\langle\text{fp expr}\rangle$  and tests whether the result is exactly **nan**. The test returns **false** for any other result, even a tuple containing **nan**.

## 29.5 Floating point expression loops

---

$\backslash\text{fp\_do\_until:nNnn}$ $\star$	$\backslash\text{fp\_do\_until:nNnn} \{\langle\text{fp expr}_1\rangle\} \langle\text{relation}\rangle \{\langle\text{fp expr}_2\rangle\} \{\langle\text{code}\rangle\}$
---	---

---

New: 2012-08-16

Places the  $\langle\text{code}\rangle$  in the input stream for  $\text{T}_{\text{E}}\text{X}$  to process, and then evaluates the relationship between the two  $\langle\text{floating point expressions}\rangle$  as described for  $\backslash\text{fp\_compare:nNnTF}$ . If the test is **false** then the  $\langle\text{code}\rangle$  is inserted into the input stream again and a loop occurs until the  $\langle\text{relation}\rangle$  is **true**.

<hr/>	<hr/>
<code>\fp_step_function:nnnN</code> ☆	<code>\fp_step_function:nnnN {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} ⟨function⟩</code>
<code>\fp_step_function:nnnc</code> ☆	This function first evaluates the ⟨ <i>initial value</i> ⟩, ⟨ <i>step</i> ⟩ and ⟨ <i>final value</i> ⟩, each of which should be a floating point expression evaluating to a floating point number, not a tuple. The ⟨ <i>function</i> ⟩ is then placed in front of each ⟨ <i>value</i> ⟩ from the ⟨ <i>initial value</i> ⟩ to the ⟨ <i>final value</i> ⟩ in turn (using ⟨ <i>step</i> ⟩ between each ⟨ <i>value</i> ⟩). The ⟨ <i>step</i> ⟩ must be non-zero. If the ⟨ <i>step</i> ⟩ is positive, the loop stops when the ⟨ <i>value</i> ⟩ becomes larger than the ⟨ <i>final value</i> ⟩. If the ⟨ <i>step</i> ⟩ is negative, the loop stops when the ⟨ <i>value</i> ⟩ becomes smaller than the ⟨ <i>final value</i> ⟩. The ⟨ <i>function</i> ⟩ should absorb one numerical argument. For example
New: 2016-11-21	
Updated: 2016-12-06	
<hr/>	<hr/>

```
\cs_set:Npn \my_func:n #1 { [I~saw~#1] \quad }
\fp_step_function:nnnN { 1.0 } { 0.1 } { 1.5 } \my_func:n
```

would print

```
[I saw 1.0]    [I saw 1.1]    [I saw 1.2]    [I saw 1.3]    [I saw 1.4]    [I saw 1.5]
```

**TpXhackers note:** Due to rounding, it may happen that adding the ⟨*step*⟩ to the ⟨*value*⟩ does not change the ⟨*value*⟩; such cases give an error, as they would otherwise lead to an infinite loop.

<hr/>	<hr/>
<code>\fp_step_inline:nnnn</code>	<code>\fp_step_inline:nnnn {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} {⟨code⟩}</code>
New: 2016-11-21	This function first evaluates the ⟨ <i>initial value</i> ⟩, ⟨ <i>step</i> ⟩ and ⟨ <i>final value</i> ⟩, all of which should be floating point expressions evaluating to a floating point number, not a tuple. Then for each ⟨ <i>value</i> ⟩ from the ⟨ <i>initial value</i> ⟩ to the ⟨ <i>final value</i> ⟩ in turn (using ⟨ <i>step</i> ⟩ between each ⟨ <i>value</i> ⟩), the ⟨ <i>code</i> ⟩ is inserted into the input stream with #1 replaced by the current ⟨ <i>value</i> ⟩. Thus the ⟨ <i>code</i> ⟩ should define a function of one argument (#1).
Updated: 2016-12-06	
<hr/>	<hr/>

<hr/>	<hr/>
<code>\fp_step_variable:nnnNn</code>	<code>\fp_step_variable:nnnNn {⟨initial value⟩} {⟨step⟩} {⟨final value⟩} ⟨tl var⟩ {⟨code⟩}</code>
New: 2017-04-12	This function first evaluates the ⟨ <i>initial value</i> ⟩, ⟨ <i>step</i> ⟩ and ⟨ <i>final value</i> ⟩, all of which should be floating point expressions evaluating to a floating point number, not a tuple. Then for each ⟨ <i>value</i> ⟩ from the ⟨ <i>initial value</i> ⟩ to the ⟨ <i>final value</i> ⟩ in turn (using ⟨ <i>step</i> ⟩ between each ⟨ <i>value</i> ⟩), the ⟨ <i>code</i> ⟩ is inserted into the input stream, with the ⟨ <i>tl var</i> ⟩ defined as the current ⟨ <i>value</i> ⟩. Thus the ⟨ <i>code</i> ⟩ should make use of the ⟨ <i>tl var</i> ⟩.
<hr/>	<hr/>

## 29.6 Symbolic expressions

Floating point expressions support variables: these can only be set locally, so act like standard `\l_...` variables.

```
\fp_new_variable:n { A }
\fp_set:Nn \l_tmpb_fp { 1 * sin(A) + 3**2 }
\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp
\fp_set_variable:nn { A } { pi/2 }
```

```

\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp
\fp_set_variable:nn { A } { 0 }
\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp

```

defines `A` to be a variable, then defines `\l_tmpb_fp` to stand for  $1 \cdot \sin(A) + 9$  (note that  $3 \cdot 2$  is evaluated, but the  $1 \cdot$  product is not simplified away). Until `\l_tmpb_fp` is changed, `\fp_show:N \l_tmpb_fp` will show  $((1 \cdot \sin(A)) + 9)$  regardless of the value of `A`. The next step defines `A` to be equal to  $\pi/2$ : then `\fp_show:n { \l_tmpb_fp }` will evaluate `\l_tmpb_fp` and show 10. We then redefine `A` to be 0: since `\l_tmpb_fp` still stands for  $1 \cdot \sin(A) + 9$ , the value shown is then 9. Variables can be set with `\fp_set_variable:nn` to arbitrary floating point expressions including other variables.

At present, the following operations and functions are *not* supported

- infix binary comparisons like `>`, `=`, `<`
- infix ternary operator like `?:`
- prefix variable-ary functions like `round` and friends, `min`, `max`, `atan`, `acot`, `atand`, `acotd`

---

```

\fp_new_variable:n \fp_new_variable:n {<identifier>}

```

---

New: 2023-10-19

Declares the `<identifier>` as a variable, which allows it to be used in floating point expressions. For instance,

```

\fp_new_variable:n { A }
\fp_show:n { A**2 - A + 1 }

```

shows  $((A^2 - A) + 1)$ . If the declaration was missing, the parser would complain about an “Unknown fp word ‘A’”. The `<identifier>` must consist entirely of Latin letters among `[a-zA-Z]`.

---

```

\fp_set_variable:nn \fp_set_variable:nn {<identifier>} {<fp expr>}

```

---

New: 2023-10-19

Sets the `<identifier>` to stand in any further expression for the result of evaluating the `<floating point expression>` as much as possible. The `<identifier>` must be declared by `\fp_new_function:n` first. The result may contain other variables, which are then replaced by their values if they have any. For instance,

```

\fp_new_variable:n { A }
\fp_new_variable:n { B }
\fp_new_variable:n { C }
\fp_set_variable:nn { A } { 3 }
\fp_set_variable:nn { C } { A ** 2 + B * 1 }
\fp_show:n { C + 4 }
\fp_set_variable:nn { A } { 4 }
\fp_show:n { C + 4 }

```

shows  $((9 + (B \cdot 1)) + 4)$  twice: changing the value of `A` to 4 does not alter `C` because `A` was replaced by its value 3 when evaluating  $A \cdot 2 + B \cdot 1$ .

<hr/> <code>\fp_clear_variable:n</code> <hr/>	<code>\fp_clear_variable:n {⟨<i>identifier</i>⟩}</code>
<hr/> <small>New: 2023-10-19</small> <hr/>	Removes any value given by <code>\fp_set_variable:nn</code> to the variable with this <i>⟨identifier⟩</i> . For instance,
	<pre> \fp_new_variable:n { A } \fp_set_variable:nn { A } { 3 } \fp_show:n { A ^ 2 } \fp_clear_variable:n { A } \fp_show:n { A ^ 2 } </pre>

shows 9, then  $(A^2)$ .

## 29.7 User-defined functions

It is possible to define new user functions which can be used inside the argument to `\fp_eval:n`, etc. These functions may take one or more named arguments, and should be implemented using expansion methods only.

<hr/> <code>\fp_new_function:n</code> <hr/>	<code>\fp_new_function:n {⟨<i>identifier</i>⟩}</code>
<hr/> <small>New: 2023-10-19</small> <hr/>	Declares the <i>⟨identifier⟩</i> as a function, which allows it to be used in floating point expressions. For instance,
	<pre> \fp_new_function:n { foo } \fp_show:n { foo ( 1 + 2 , foo(3), A ) ** 2 } } </pre>
	shows $(\text{foo}(3, \text{foo}(3), A))^2$ . If the declaration was missing, the parser would complain about an “Unknown fp word ‘foo’”. The <i>⟨identifier⟩</i> must consist entirely of Latin letters [a-zA-Z].

<hr/> <code>\fp_set_function:nnn</code> <hr/>	<code>\fp_set_function:nnn {⟨<i>identifier</i>⟩} {⟨<i>vars</i>⟩} {⟨<i>fp expr</i>⟩}</code>
<hr/> <small>New: 2023-10-19</small> <hr/>	Sets the <i>⟨identifier⟩</i> to stand in any further expression for the result of evaluating the <i>⟨floating point expression⟩</i> , with the <i>⟨identifier⟩</i> accepting the <i>⟨vars⟩</i> (a non-empty comma-separated list). The <i>⟨identifier⟩</i> must be declared by <code>\fp_new_function:n</code> first. The result may contain other functions, which are then replaced by their results if they have any. For instance,
	<pre> \fp_new_function:n { npow } \fp_set_function:nnn { npow } { a,b } { a**b } \fp_show:n { npow(16,0.25) } </pre>
	shows 2. The names of the <i>⟨vars⟩</i> must consist entirely of Latin letters [a-zA-Z], but are otherwise not restricted: in particular, they are independent of any variables declared by <code>\fp_new_variable:n</code> .

<hr/> <code>\fp_clear_function:n</code> <hr/>	<code>\fp_clear_function:n {⟨<i>identifier</i>⟩}</code>
<hr/> <small>New: 2023-10-19</small> <hr/>	Removes any definition given by <code>\fp_set_function:nnn</code> to the function with this <i>⟨identifier⟩</i> .

## 29.8 Some useful constants, and scratch variables

<hr/> <code>\c_zero_fp</code> <code>\c_minus_zero_fp</code> <hr/>	Zero, with either sign.  New: 2012-05-08 <hr/>
<hr/> <code>\c_one_fp</code> <hr/>	One as an <code>fp</code> : useful for comparisons in some places.  New: 2012-05-08 <hr/>
<hr/> <code>\c_inf_fp</code> <code>\c_minus_inf_fp</code> <hr/>	Infinity, with either sign. These can be input directly in a floating point expression as <code>inf</code> and <code>-inf</code> .  New: 2012-05-08 <hr/>
<hr/> <code>\c_nan_fp</code> <hr/>	Not a number. This can be input directly in a floating point expression as <code>nan</code> .  New: 2012-05-08 <hr/>
<hr/> <code>\c_e_fp</code> <hr/>	The value of the base of the natural logarithm, $e = \exp(1)$ .  Updated: 2012-05-08 <hr/>
<hr/> <code>\c_pi_fp</code> <hr/>	The value of $\pi$ . This can be input directly in a floating point expression as <code>pi</code> .  Updated: 2013-11-17 <hr/>
<hr/> <code>\c_one_degree_fp</code> <hr/>	The value of $1^\circ$ in radians. Multiply an angle given in degrees by this value to obtain a result in radians. Note that trigonometric functions expecting an argument in radians or in degrees are both available. Within floating point expressions, this can be accessed as <code>deg</code> .  New: 2012-05-08 Updated: 2013-11-17 <hr/>

## 29.9 Scratch variables

<hr/> <code>\l_tmpa_fp</code> <code>\l_tmpb_fp</code> <hr/>	Scratch floating points for local assignment. These are never used by the kernel code, and so are safe for use with any $\text{\LaTeX}3$ -defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<hr/> <code>\g_tmpa_fp</code> <code>\g_tmpb_fp</code> <hr/>	Scratch floating points for global assignment. These are never used by the kernel code, and so are safe for use with any $\text{\LaTeX}3$ -defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 29.10 Floating point exceptions

The functions defined in this section are experimental, and their functionality may be altered or removed altogether.

“Exceptions” may occur when performing some floating point operations, such as  $0 / 0$ , or  $10 ** 1e9999$ . The relevant IEEE standard defines 5 types of exceptions, of which we implement 4.

- *Overflow* occurs whenever the result of an operation is too large to be represented as a normal floating point number. This results in  $\pm\infty$ .
- *Underflow* occurs whenever the result of an operation is too close to 0 to be represented as a normal floating point number. This results in  $\pm 0$ .
- *Invalid operation* occurs for operations with no defined outcome, for instance  $0/0$  or  $\sin(\infty)$ , and results in a `nan`. It also occurs for conversion functions whose target type does not have the appropriate infinite or `nan` value (e.g., `\fp_to_dim:n`).
- *Division by zero* occurs when dividing a non-zero number by 0, or when evaluating functions at poles, e.g.,  $\ln(0)$  or  $\cot(0)$ . This results in  $\pm\infty$ .

(not yet) *Inexact* occurs whenever the result of a computation is not exact, in other words, almost always. At the moment, this exception is entirely ignored in L<sup>A</sup>T<sub>E</sub>X3.

To each exception we associate a “flag”: `\l_fp_overflow_flag`, `\l_fp_underflow_flag`, `\l_fp_invalid_operation_flag` and `\l_fp_division_by_zero_flag`. The state of these flags can be tested and modified with commands from `l3flag`

By default, the “invalid operation” exception triggers an (expandable) error, and raises the corresponding flag. Other exceptions raise the corresponding flag but do not trigger an error. The behaviour when an exception occurs can be modified (using `\fp_trap:nn`) to either produce an error and raise the flag, or only raise the flag, or do nothing at all.

<code>\fp_trap:nn</code>	<code>\fp_trap:nn {&lt;exception&gt;} {&lt;trap type&gt;}</code>
New: 2012-07-19	All occurrences of the <code>&lt;exception&gt;</code> ( <code>overflow</code> , <code>underflow</code> , <code>invalid_operation</code> or <code>division_by_zero</code> ) within the current group are treated as <code>&lt;trap type&gt;</code> , which can be
Updated: 2017-02-13	

- **none**: the `<exception>` will be entirely ignored, and leave no trace;
- **flag**: the `<exception>` will turn the corresponding flag on when it occurs;
- **error**: additionally, the `<exception>` will halt the T<sub>E</sub>X run and display some information about the current operation in the terminal.

---

```

\l_fp_overflow_flag
\l_fp_underflow_flag
\l_fp_invalid_operation_flag
\l_fp_division_by_zero_flag

```

---

Flags denoting the occurrence of various floating-point exceptions.

## 29.11 Viewing floating points

---

<code>\fp_show:N</code>	<code>\fp_show:N &lt;fp var&gt;</code>
<code>\fp_show:c</code>	<code>\fp_show:n {&lt;fp expr&gt;}</code>
<code>\fp_show:n</code>	Evaluates the <code>&lt;fp expr&gt;</code> and displays the result in the terminal.

---

New: 2012-05-08

Updated: 2021-04-29

---

---

<code>\fp_log:N</code>	<code>\fp_log:N &lt;fp var&gt;</code>
<code>\fp_log:c</code>	<code>\fp_log:n {&lt;fp expr&gt;}</code>
<code>\fp_log:n</code>	Evaluates the <code>&lt;fp expr&gt;</code> and writes the result in the log file.

---

New: 2014-08-22

Updated: 2021-04-29

## 29.12 Floating point expressions

### 29.12.1 Input of floating point numbers

We support four types of floating point numbers:

- $\pm m \cdot 10^n$ , a floating point number, with integer  $1 \leq m \leq 10^{16}$ , and  $-10000 \leq n \leq 10000$ ;
- $\pm 0$ , zero, with a given sign;
- $\pm \infty$ , infinity, with a given sign;
- **nan**, is “not a number”, and can be either quiet or signalling (*not yet*: this distinction is currently unsupported);

Normal floating point numbers are stored in base 10, with up to 16 significant figures.

On input, a normal floating point number consists of:

- `<sign>`: a possibly empty string of + and - characters;
- `<significand>`: a non-empty string of digits together with zero or one dot;
- `<exponent>` optionally: the character **e** or **E**, followed by a possibly empty string of + and - tokens, and a non-empty string of digits.

The sign of the resulting number is + if `<sign>` contains an even number of -, and - otherwise, hence, an empty `<sign>` denotes a non-negative input. The stored significand is obtained from `<significand>` by omitting the decimal separator and leading zeros, and rounding to 16 significant digits, filling with trailing zeros if necessary. In particular, the value stored is exact if the input `<significand>` has at most 16 digits. The stored `<exponent>` is obtained by combining the input `<exponent>` (0 if absent) with a shift depending on the position of the significand and the number of leading zeros.

A special case arises if the resulting `<exponent>` is either too large or too small for the floating point number to be represented. This results either in an overflow (the number is then replaced by  $\pm \infty$ ), or an underflow (resulting in  $\pm 0$ ).

The result is thus  $\pm 0$  if and only if  $\langle \textit{significand} \rangle$  contains no non-zero digit (i.e., consists only in characters 0, and an optional period), or if there is an underflow. Note that a single dot is currently a valid floating point number, equal to  $+0$ , but that is not guaranteed to remain true.

The  $\langle \textit{significand} \rangle$  must be non-empty, so `e1` and `e-1` are not valid floating point numbers. Note that the latter could be mistaken with the difference of “e” and 1. To avoid confusions, the base of natural logarithms cannot be input as `e` and should be input as `exp(1)` or `\c_e_fp` (which is faster).

Special numbers are input as follows:

- `inf` represents  $+\infty$ , and can be preceded by any  $\langle \textit{sign} \rangle$ , yielding  $\pm\infty$  as appropriate.
- `nan` represents a (quiet) non-number. It can be preceded by any sign, but that sign is ignored.
- Any unrecognizable string triggers an error, and produces a `nan`.
- Note that commands such as `\infty`, `\pi`, or `\sin` *do not* work in floating point expressions. They may silently be interpreted as completely unexpected numbers, because integer constants (allowed in expressions) are commonly stored as mathematical characters.

### 29.12.2 Precedence of operators

We list here all the operations supported in floating point expressions, in order of decreasing precedence: operations listed earlier bind more tightly than operations listed below them.

- Function calls (`sin`, `ln`, *etc*).
- Binary `**` and `^` (right associative).
- Unary `+`, `-`, `!`.
- Implicit multiplication by juxtaposition (`2pi`) when neither factor is in parentheses.
- Binary `*` and `/`, implicit multiplication by juxtaposition with parentheses (for instance `3(4+5)`).
- Binary `+` and `-`.
- Comparisons `>=`, `!=`, `<?`, *etc*.
- Logical `and`, denoted by `&&`.
- Logical `or`, denoted by `||`.
- Ternary operator `?:` (right associative).
- Comma (to build tuples).

The precedence of operations can be overridden using parentheses. In particular, the precedence of juxtaposition implies that

$$\begin{aligned} 1/2\text{pi} &= 1/(2\pi), \\ 1/2\text{pi}(\text{pi} + \text{pi}) &= (2\pi)^{-1}(\pi + \pi) \simeq 1, \\ \sin 2\text{pi} &= \sin(2)\pi \neq 0, \\ 2^2\text{max}(3, 5) &= 2^2 \max(3, 5) = 20, \\ 1\text{in}/1\text{cm} &= (1\text{in})/(1\text{cm}) = 2.54. \end{aligned}$$

Functions are called on the value of their argument, contrarily to  $\text{\TeX}$  macros.

### 29.12.3 Operations

We now present the various operations allowed in floating point expressions, from the lowest precedence to the highest. When used as a truth value, a floating point expression is **false** if it is  $\pm 0$ , and **true** otherwise, including when it is **nan** or a tuple such as  $(0, 0)$ . Tuples are only supported to some extent by operations that work with truth values ( $?:$ ,  $||$ ,  $\&\&$ ,  $!$ ), by comparisons ( $!<=>?$ ), and by  $+$ ,  $-$ ,  $*$ ,  $/$ . Unless otherwise specified, providing a tuple as an argument of any other operation yields the “invalid operation” exception and a **nan** result.

---

```
?: \fp_eval:n { <operand_1> ? <operand_2> : <operand_3> }
```

---

The ternary operator  $?:$  results in  $\langle\text{operand}_2\rangle$  if  $\langle\text{operand}_1\rangle$  is true (not  $\pm 0$ ), and  $\langle\text{operand}_3\rangle$  if  $\langle\text{operand}_1\rangle$  is false ( $\pm 0$ ). All three  $\langle\text{operands}\rangle$  are evaluated in all cases; they may be tuples. The operator is right associative, hence

```
\fp_eval:n
{
  1 + 3 > 4 ? 1 :
  2 + 4 > 5 ? 2 :
  3 + 5 > 6 ? 3 : 4
}
```

first tests whether  $1 + 3 > 4$ ; since this isn’t true, the branch following  $:$  is taken, and  $2 + 4 > 5$  is compared; since this is true, the branch before  $:$  is taken, and everything else is (evaluated then) ignored. That allows testing for various cases in a concise manner, with the drawback that all computations are made in all cases.

---

```
|| \fp_eval:n { <operand_1> || <operand_2> }
```

---

If  $\langle\text{operand}_1\rangle$  is true (not  $\pm 0$ ), use that value, otherwise the value of  $\langle\text{operand}_2\rangle$ . Both  $\langle\text{operands}\rangle$  are evaluated in all cases; they may be tuples. In  $\langle\text{operand}_1\rangle || \langle\text{operand}_2\rangle || \dots || \langle\text{operands}_n\rangle$ , the first true (nonzero)  $\langle\text{operand}\rangle$  is used and if all are zero the last one ( $\pm 0$ ) is used.

---

```
&& \fp_eval:n { <operand_1> && <operand_2> }
```

---

If  $\langle\text{operand}_1\rangle$  is false (equal to  $\pm 0$ ), use that value, otherwise the value of  $\langle\text{operand}_2\rangle$ . Both  $\langle\text{operands}\rangle$  are evaluated in all cases; they may be tuples. In  $\langle\text{operand}_1\rangle \&\& \langle\text{operand}_2\rangle \&\& \dots \&\& \langle\text{operands}_n\rangle$ , the first false ( $\pm 0$ )  $\langle\text{operand}\rangle$  is used and if none is zero the last one is used.

---

```

<      \fp_eval:n
=      {
>      <operand1> <relation1>
?      ...
      <operandN> <relationN>
Updated: 2013-12-14  <operandN+1>
      }

```

---

Each  $\langle \text{relation} \rangle$  consists of a non-empty string of  $<$ ,  $=$ ,  $>$ , and  $?$ , optionally preceded by  $!$ , and may not start with  $?$ . This evaluates to  $+1$  if all comparisons  $\langle \text{operand}_i \rangle \langle \text{relation}_i \rangle \langle \text{operand}_{i+1} \rangle$  are true, and  $+0$  otherwise. All  $\langle \text{operands} \rangle$  are evaluated (once) in all cases. See `\fp_compare:nTF` for details.

---

```

+ \fp_eval:n { <operand1> + <operand2> }
- \fp_eval:n { <operand1> - <operand2> }

```

---

Computes the sum or the difference of its two  $\langle \text{operands} \rangle$ . The “invalid operation” exception occurs for  $\infty - \infty$ . “Underflow” and “overflow” occur when appropriate. These operations supports the itemwise addition or subtraction of two tuples, but if they have a different number of items the “invalid operation” exception occurs and the result is **nan**.

---

```

* \fp_eval:n { <operand1> * <operand2> }
/ \fp_eval:n { <operand1> / <operand2> }

```

---

Computes the product or the ratio of its two  $\langle \text{operands} \rangle$ . The “invalid operation” exception occurs for  $\infty/\infty$ ,  $0/0$ , or  $0 * \infty$ . “Division by zero” occurs when dividing a finite non-zero number by  $\pm 0$ . “Underflow” and “overflow” occur when appropriate. When  $\langle \text{operand}_1 \rangle$  is a tuple and  $\langle \text{operand}_2 \rangle$  is a floating point number, each item of  $\langle \text{operand}_1 \rangle$  is multiplied or divided by  $\langle \text{operand}_2 \rangle$ . Multiplication also supports the case where  $\langle \text{operand}_1 \rangle$  is a floating point number and  $\langle \text{operand}_2 \rangle$  a tuple. Other combinations yield an “invalid operation” exception and a **nan** result.

---

```

+ \fp_eval:n { + <operand> }
- \fp_eval:n { - <operand> }
! \fp_eval:n { ! <operand> }

```

---

The unary  $+$  does nothing, the unary  $-$  changes the sign of the  $\langle \text{operand} \rangle$  (for a tuple, of all its components), and  $!$   $\langle \text{operand} \rangle$  evaluates to 1 if  $\langle \text{operand} \rangle$  is false (is  $\pm 0$ ) and 0 otherwise (this is the **not** boolean function). Those operations never raise exceptions.

---

```

** \fp_eval:n { <operand1> ** <operand2> }
^ \fp_eval:n { <operand1> ^ <operand2> }

```

---

Raises  $\langle \text{operand}_1 \rangle$  to the power  $\langle \text{operand}_2 \rangle$ . This operation is right associative, hence  $2^{**} 2^{**} 3$  equals  $2^{2^3} = 256$ . If  $\langle \text{operand}_1 \rangle$  is negative or  $-0$  then: the result’s sign is  $+$  if the  $\langle \text{operand}_2 \rangle$  is infinite and  $(-1)^p$  if the  $\langle \text{operand}_2 \rangle$  is  $p/5^q$  with  $p, q$  integers; the result is  $+0$  if  $\text{abs}(\langle \text{operand}_1 \rangle)^{\langle \text{operand}_2 \rangle}$  evaluates to zero; in other cases the “invalid operation” exception occurs because the sign cannot be determined. “Division by zero” occurs when raising  $\pm 0$  to a finite strictly negative power. “Underflow” and “overflow” occur when appropriate. If either operand is a tuple, “invalid operation” occurs.

---

```

abs \fp_eval:n { abs( <fp expr> ) }

```

---

Computes the absolute value of the  $\langle \text{fp expr} \rangle$ . If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases. See also `\fp_abs:n`.

<hr/>	
<b>exp</b>	<code>\fp_eval:n { exp( &lt;fp expr&gt; ) }</code>
	Computes the exponential of the $\langle fp\ expr \rangle$ . “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.
<hr/>	
<b>fact</b>	<code>\fp_eval:n { fact( &lt;fp expr&gt; ) }</code>
	Computes the factorial of the $\langle fp\ expr \rangle$ . If the $\langle fp\ expr \rangle$ is an integer between $-0$ and $3248$ included, the result is finite and correctly rounded. Larger positive integers give $+\infty$ with “overflow”, while $\text{fact}(+\infty) = +\infty$ and $\text{fact}(\text{nan}) = \text{nan}$ with no exception. All other inputs give $\text{nan}$ with the “invalid operation” exception.
<hr/>	
<b>ln</b>	<code>\fp_eval:n { ln( &lt;fp expr&gt; ) }</code>
	Computes the natural logarithm of the $\langle fp\ expr \rangle$ . Negative numbers have no (real) logarithm, hence the “invalid operation” is raised in that case, including for $\ln(-0)$ . “Division by zero” occurs when evaluating $\ln(+0) = -\infty$ . “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.
<hr/>	
<b>logb</b>	<code>* \fp_eval:n { logb( &lt;fp expr&gt; ) }</code>
<hr/>	
<small>New: 2018-11-03</small>	Determines the exponent of the $\langle fp\ expr \rangle$ , namely the floor of the base-10 logarithm of its absolute value. “Division by zero” occurs when evaluating $\text{logb}(\pm 0) = -\infty$ . Other special values are $\text{logb}(\pm\infty) = +\infty$ and $\text{logb}(\text{nan}) = \text{nan}$ . If the operand is a tuple or is $\text{nan}$ , then “invalid operation” occurs and the result is $\text{nan}$ .
<hr/>	
<b>max</b>	<code>\fp_eval:n { max( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; , ... ) }</code>
<b>min</b>	<code>\fp_eval:n { min( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; , ... ) }</code>
	Evaluates each $\langle fp\ expr \rangle$ and computes the largest (smallest) of those. If any of the $\langle fp\ expr \rangle$ is a $\text{nan}$ or tuple, the result is $\text{nan}$ . If any operand is a tuple, “invalid operation” occurs; these operations do not raise exceptions in other cases.

<b>round</b>	<code>\fp_eval:n { round ( &lt;fp expr&gt; ) }</code>
<b>trunc</b>	<code>\fp_eval:n { round ( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>
<b>ceil</b>	<code>\fp_eval:n { round ( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; , &lt;fp expr<sub>3</sub>&gt; ) }</code>
<b>floor</b>	Only <b>round</b> accepts a third argument. Evaluates $\langle fp\ expr_1 \rangle = x$ and $\langle fp\ expr_2 \rangle = n$ and $\langle fp\ expr_3 \rangle = t$ then rounds $x$ to $n$ places. If $n$ is an integer, this rounds $x$ to a multiple of $10^{-n}$ ; if $n = +\infty$ , this always yields $x$ ; if $n = -\infty$ , this yields one of $\pm 0$ , $\pm\infty$ , or <b>nan</b> ; if $n = \mathbf{nan}$ , this yields <b>nan</b> ; if $n$ is neither $\pm\infty$ nor an integer, then an “invalid operation” exception is raised. When $\langle fp\ expr_2 \rangle$ is omitted, $n = 0$ , i.e., $\langle fp\ expr_1 \rangle$ is rounded to an integer. The rounding direction depends on the function.

New: 2013-12-14  
Updated: 2015-08-08

- **round** yields the multiple of  $10^{-n}$  closest to  $x$ , with ties ( $x$  half-way between two such multiples) rounded as follows. If  $t$  is **nan** (or not given) the even multiple is chosen (“ties to even”), if  $t = \pm 0$  the multiple closest to 0 is chosen (“ties to zero”), if  $t$  is positive/negative the multiple closest to  $\infty/-\infty$  is chosen (“ties towards positive/negative infinity”).
- **floor** yields the largest multiple of  $10^{-n}$  smaller or equal to  $x$  (“round towards negative infinity”);
- **ceil** yields the smallest multiple of  $10^{-n}$  greater or equal to  $x$  (“round towards positive infinity”);
- **trunc** yields a multiple of  $10^{-n}$  with the same sign as  $x$  and with the largest absolute value less than that of  $x$  (“round towards zero”).

“Overflow” occurs if  $x$  is finite and the result is infinite (this can only happen if  $\langle fp\ expr_2 \rangle < -9984$ ). If any operand is a tuple, “invalid operation” occurs.

---

**sign** `\fp_eval:n { sign( <fp expr> ) }`

Evaluates the  $\langle fp\ expr \rangle$  and determines its sign: +1 for positive numbers and for  $+\infty$ , -1 for negative numbers and for  $-\infty$ ,  $\pm 0$  for  $\pm 0$ , and **nan** for **nan**. If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases.

<b>sin</b>	<code>\fp_eval:n { sin( &lt;fp expr&gt; ) }</code>
<b>cos</b>	<code>\fp_eval:n { cos( &lt;fp expr&gt; ) }</code>
<b>tan</b>	<code>\fp_eval:n { tan( &lt;fp expr&gt; ) }</code>
<b>cot</b>	<code>\fp_eval:n { cot( &lt;fp expr&gt; ) }</code>
<b>csc</b>	<code>\fp_eval:n { csc( &lt;fp expr&gt; ) }</code>
<b>sec</b>	<code>\fp_eval:n { sec( &lt;fp expr&gt; ) }</code>

Updated: 2013-11-17

Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the  $\langle fp\ expr \rangle$  given in radians. For arguments given in degrees, see **sind**, **cosd**, etc. Note that since  $\pi$  is irrational,  $\sin(8\pi)$  is not quite zero, while its analogue  $\text{sind}(8 \times 180)$  is exactly zero. The trigonometric functions are undefined for an argument of  $\pm\infty$ , leading to the “invalid operation” exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a “division by zero” exception. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

<code>sind</code>	<code>\fp_eval:n { sind( &lt;fp expr&gt; ) }</code>
<code>cosd</code>	<code>\fp_eval:n { cosd( &lt;fp expr&gt; ) }</code>
<code>tand</code>	<code>\fp_eval:n { tand( &lt;fp expr&gt; ) }</code>
<code>cotd</code>	<code>\fp_eval:n { cotd( &lt;fp expr&gt; ) }</code>
<code>cscd</code>	<code>\fp_eval:n { cscd( &lt;fp expr&gt; ) }</code>
<code>secd</code>	<code>\fp_eval:n { secd( &lt;fp expr&gt; ) }</code>

---

**New: 2013-11-02** Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the  $\langle fp\ expr \rangle$  given in degrees. For arguments given in radians, see `sin`, `cos`, etc. Note that since  $\pi$  is irrational, `sin(8pi)` is not quite zero, while its analogue `sind(8 × 180)` is exactly zero. The trigonometric functions are undefined for an argument of  $\pm\infty$ , leading to the “invalid operation” exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a “division by zero” exception. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

<code>asin</code>	<code>\fp_eval:n { asin( &lt;fp expr&gt; ) }</code>
<code>acos</code>	<code>\fp_eval:n { acos( &lt;fp expr&gt; ) }</code>
<code>acsc</code>	<code>\fp_eval:n { acsc( &lt;fp expr&gt; ) }</code>
<code>asec</code>	<code>\fp_eval:n { asec( &lt;fp expr&gt; ) }</code>

---

**New: 2013-11-02** Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fp\ expr \rangle$  and returns the result in radians, in the range  $[-\pi/2, \pi/2]$  for `asin` and `acsc` and  $[0, \pi]$  for `acos` and `asec`. For a result in degrees, use `asind`, etc. If the argument of `asin` or `acos` lies outside the range  $[-1, 1]$ , or the argument of `acsc` or `asec` inside the range  $(-1, 1)$ , an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

<code>asind</code>	<code>\fp_eval:n { asind( &lt;fp expr&gt; ) }</code>
<code>acosd</code>	<code>\fp_eval:n { acosd( &lt;fp expr&gt; ) }</code>
<code>acscd</code>	<code>\fp_eval:n { acscd( &lt;fp expr&gt; ) }</code>
<code>asecd</code>	<code>\fp_eval:n { asecd( &lt;fp expr&gt; ) }</code>

---

**New: 2013-11-02** Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fp\ expr \rangle$  and returns the result in degrees, in the range  $[-90, 90]$  for `asind` and `acscd` and  $[0, 180]$  for `acosd` and `asecd`. For a result in radians, use `asin`, etc. If the argument of `asind` or `acosd` lies outside the range  $[-1, 1]$ , or the argument of `acscd` or `asecd` inside the range  $(-1, 1)$ , an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

<b>atan</b>	<code>\fp_eval:n { atan( &lt;fp expr&gt; ) }</code>
<b>acot</b>	<code>\fp_eval:n { atan( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>
<hr/>	
<b>New: 2013-11-02</b>	<code>\fp_eval:n { acot( &lt;fp expr&gt; ) }</code>
	<code>\fp_eval:n { acot( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>

Those functions yield an angle in radians: **atand** and **acotd** are their analogs in degrees. The one-argument versions compute the arctangent or arccotangent of the  $\langle fp \text{ expr} \rangle$ : arctangent takes values in the range  $[-\pi/2, \pi/2]$ , and arccotangent in the range  $[0, \pi]$ . The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fp \text{ expr}_2 \rangle, \langle fp \text{ expr}_1 \rangle)$ : this is the arctangent of  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$ , possibly shifted by  $\pi$  depending on the signs of  $\langle fp \text{ expr}_1 \rangle$  and  $\langle fp \text{ expr}_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fp \text{ expr}_1 \rangle, \langle fp \text{ expr}_2 \rangle)$ , equal to the arccotangent of  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$ , possibly shifted by  $\pi$ . Both two-argument functions take values in the wider range  $[-\pi, \pi]$ . The ratio  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm \infty$ , the resulting angle is one of  $\{\pm\pi/4, \pm 3\pi/4\}$  depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

<b>atand</b>	<code>\fp_eval:n { atand( &lt;fp expr&gt; ) }</code>
<b>acotd</b>	<code>\fp_eval:n { atand( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>
<hr/>	
<b>New: 2013-11-02</b>	<code>\fp_eval:n { acotd( &lt;fp expr&gt; ) }</code>
	<code>\fp_eval:n { acotd( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>

Those functions yield an angle in degrees: **atan** and **acot** are their analogs in radians. The one-argument versions compute the arctangent or arccotangent of the  $\langle fp \text{ expr} \rangle$ : arctangent takes values in the range  $[-90, 90]$ , and arccotangent in the range  $[0, 180]$ . The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fp \text{ expr}_2 \rangle, \langle fp \text{ expr}_1 \rangle)$ : this is the arctangent of  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$ , possibly shifted by 180 depending on the signs of  $\langle fp \text{ expr}_1 \rangle$  and  $\langle fp \text{ expr}_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fp \text{ expr}_1 \rangle, \langle fp \text{ expr}_2 \rangle)$ , equal to the arccotangent of  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$ , possibly shifted by 180. Both two-argument functions take values in the wider range  $[-180, 180]$ . The ratio  $\langle fp \text{ expr}_1 \rangle / \langle fp \text{ expr}_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm \infty$ , the resulting angle is one of  $\{\pm 45, \pm 135\}$  depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

<b>sqrt</b>	<code>\fp_eval:n { sqrt( &lt;fp expr&gt; ) }</code>
<hr/>	
<b>New: 2013-12-14</b>	Computes the square root of the $\langle fp \text{ expr} \rangle$ . The “invalid operation” is raised when the $\langle fp \text{ expr} \rangle$ is negative or is a tuple; no other exception can occur. Special values yield $\sqrt{-0} = -0$ , $\sqrt{+0} = +0$ , $\sqrt{+\infty} = +\infty$ and $\sqrt{\text{nan}} = \text{nan}$ .

---

<b>rand</b>	<code>\fp_eval:n { rand() }</code>
-------------	------------------------------------

---

New: 2016-12-05 Produces a pseudo-random floating-point number (multiple of  $10^{-16}$ ) between 0 included and 1 excluded. This is not available in older versions of  $\text{X}\text{\TeX}$ . The random seed can be queried using `\sys_rand_seed:` and set using `\sys_gset_rand_seed:n`.

**$\text{T}\text{\E}\text{X}$ hackers note:** This is based on pseudo-random numbers provided by the engine’s primitive `\pdfuniformdeviate` in  $\text{pdf}\text{\TeX}$ ,  $\text{p}\text{\TeX}$ ,  $\text{up}\text{\TeX}$  and `\uniformdeviate` in  $\text{Lua}\text{\TeX}$  and  $\text{X}\text{\TeX}$ . The underlying code is based on Metapost, which follows an additive scheme recommended in Section 3.6 of “The Art of Computer Programming, Volume 2”.

While we are more careful than `\uniformdeviate` to preserve uniformity of the underlying stream of 28-bit pseudo-random integers, these pseudo-random numbers should of course not be relied upon for serious numerical computations nor cryptography.

---

<b>randint</b>	<code>\fp_eval:n { randint( &lt;fp expr&gt; ) }</code>
	<code>\fp_eval:n { randint( &lt;fp expr<sub>1</sub>&gt; , &lt;fp expr<sub>2</sub>&gt; ) }</code>

---

New: 2016-12-05

Produces a pseudo-random integer between 1 and  $\langle fp\ expr \rangle$  or between  $\langle fp\ expr_1 \rangle$  and  $\langle fp\ expr_2 \rangle$  inclusive. The bounds must be integers in the range  $(-10^{16}, 10^{16})$  and the first must be smaller or equal to the second. See **rand** for important comments on how these pseudo-random numbers are generated.

---

<b>inf</b>	The special values $+\infty$ , $-\infty$ , and <b>nan</b> are represented as <b>inf</b> , <b>-inf</b> and <b>nan</b> (see <code>\c_inf_fp</code> , <code>\c_minus_inf_fp</code> and <code>\c_nan_fp</code> ).
<b>nan</b>	

---

---

<b>pi</b>	The value of $\pi$ (see <code>\c_pi_fp</code> ).
-----------	--

---

---

<b>deg</b>	The value of $1^\circ$ in radians (see <code>\c_one_degree_fp</code> ).
------------	---

---

---

**em** Those units of measurement are equal to their values in **pt**, namely

**ex**

**in**  $1\text{ in} = 72.27\text{ pt}$

**pt**  $1\text{ pt} = 1\text{ pt}$

**pc**  $1\text{ pc} = 12\text{ pt}$

**cm**

**mm**  $1\text{ cm} = \frac{1}{2.54}\text{ in} = 28.45275590551181\text{ pt}$

**dd**

**cc**  $1\text{ mm} = \frac{1}{25.4}\text{ in} = 2.845275590551181\text{ pt}$

**nd**

**nc**  $1\text{ dd} = 0.376065\text{ mm} = 1.07000856496063\text{ pt}$

**bp**  $1\text{ cc} = 12\text{ dd} = 12.84010277952756\text{ pt}$

**sp**  $1\text{ nd} = 0.375\text{ mm} = 1.066978346456693\text{ pt}$

$1\text{ nc} = 12\text{ nd} = 12.80374015748031\text{ pt}$

$1\text{ bp} = \frac{1}{72}\text{ in} = 1.00375\text{ pt}$

$1\text{ sp} = 2^{-16}\text{ pt} = 1.52587890625 \times 10^{-5}\text{ pt}.$

The values of the (font-dependent) units **em** and **ex** are gathered from  $\text{\TeX}$  when the surrounding floating point expression is evaluated.

---

**true** Other names for 1 and +0.

**false**

---

---

**\fp\_abs:n**  $\star$  **\fp\_abs:n**  $\{\langle fp\ expr \rangle\}$

New: 2012-05-14 Evaluates the  $\langle fp\ expr \rangle$  as described for **\fp\_eval:n** and leaves the absolute value of  
Updated: 2012-07-08 the result in the input stream. If the argument is  $\pm\infty$ , **nan** or a tuple, “invalid operation” occurs. Within floating point expressions, **abs()** can be used; it accepts  $\pm\infty$  and **nan** as arguments.

---

**\fp\_max:nn**  $\star$  **\fp\_max:nn**  $\{\langle fp\ expr_1 \rangle\} \{\langle fp\ expr_2 \rangle\}$

**\fp\_min:nn**  $\star$  Evaluates the  $\langle fp\ exprs \rangle$  as described for **\fp\_eval:n** and leaves the resulting larger  
New: 2012-09-26 (**max**) or smaller (**min**) value in the input stream. If the argument is a tuple, “invalid operation” occurs, but no other case raises exceptions. Within floating point expressions, **max()** and **min()** can be used.

## 29.13 Disclaimer and roadmap

This module may break if the escape character is among **0123456789\_+**, or if it receives a  $\text{\TeX}$  primitive conditional affected by **\exp\_not:N**.

The following need to be done. I’ll try to time-order the items.

- Function to count items in a tuple (and to determine if something is a tuple).
- Decide what exponent range to consider.

- Support signalling `nan`.
- Modulo and remainder, and rounding function `quantize` (and its friends analogous to `trunc`, `ceil`, `floor`).
- `\fp_format:nn {<fp expr>} {<format>}`, but what should `<format>` be? More general pretty printing?
- Add `and`, `or`, `xor`? Perhaps under the names `all`, `any`, and `xor`?
- Add `log(x,b)` for logarithm of  $x$  in base  $b$ .
- `hypot` (Euclidean length). Cartesian-to-polar transform.
- Hyperbolic functions `cosh`, `sinh`, `tanh`.
- Inverse hyperbolics.
- Base conversion, input such as `0xAB.CDEF`.
- Factorial (not with `!`), gamma function.
- Improve coefficients of the `sin` and `tan` series.
- Treat upper and lower case letters identically in identifiers, and ignore underscores.
- Add an `array(1,2,3)` and `i=complex(0,1)`.
- Provide an experimental `map` function? Perhaps easier to implement if it is a single character, `@sin(1,2)`?
- Provide an `isnan` function analogue of `\fp_if_nan:nTF`?
- Support keyword arguments?

`Pgfmath` also provides box-measurements (depth, height, width), but boxes are not possible expandably.

Bugs, and tests to add.

- Check that functions are monotonic when they should.
- Add exceptions to `?:`, `!<=>?`, `&&`, `||`, and `!`.
- Logarithms of numbers very close to 1 are inaccurate.
- When rounding towards  $-\infty$ , `\dim_to_fp:n {Opt}` should return  $-0$ , not  $+0$ .
- The result of  $(\pm 0) + (\pm 0)$ , of  $x + (-x)$ , and of  $(-x) + x$  should depend on the rounding mode.
- `0e9999999999` gives a  $\text{T}_{\text{E}}\text{X}$  “number too large” error.
- Subnormals are not implemented.

Possible optimizations/improvements.

- Document that `l3trial/l3fp-types` introduces tools for adding new types.
- In subsection [29.12.1](#), write a grammar.

- It would be nice if the `parse` auxiliaries for each operation were set up in the corresponding module, rather than centralizing in `l3fp-parse`.
- Some functions should get an `_o` ending to indicate that they expand after their result.
- More care should be given to distinguish expandable/restricted expandable (auxiliary and internal) functions.
- The code for the `ternary` set of functions is ugly.
- There are many `~` missing in the doc to avoid bad line-breaks.
- The algorithm for computing the logarithm of the significand could be made to use a 5 terms Taylor series instead of 10 terms by taking  $c = 2000/([200x] + 1) \in [10, 95]$  instead of  $c \in [1, 10]$ . Also, it would then be possible to simplify the computation of  $t$ . However, we would then have to hard-code the logarithms of 44 small integers instead of 9.
- Improve notations in the explanations of the division algorithm (`l3fp-basics`).
- Understand and document `\_fp\_basics\_pack\_weird\_low:NNNNw` and `\_fp\_basics\_pack\_weird\_high:NNNNNNNNw` better. Move the other `basics\_pack` auxiliaries to `l3fp-aux` under a better name.
- Find out if underflow can really occur for trigonometric functions, and redoc as appropriate.
- Add bibliography. Some of Kahan’s articles, some previous T<sub>E</sub>X fp packages, the international standards,...
- Also take into account the “inexact” exception?
- Support multi-character prefix operators (*e.g.*, `@/` or whatever)?

## Chapter 30

# The `l3fparray` module

## Fast global floating point arrays

For applications requiring heavy use of floating points, this module provides arrays which can be accessed in constant time (contrast `l3seq`, where access time is linear). The interface is very close to that of `l3intarray`. The size of the array is fixed and must be given at point of initialisation

### 30.1 Creating and initialising floating point array variables

---

<code>\fparray_new:Nn</code>	<code>\fparray_new:Nn &lt;fparray var&gt; {&lt;size&gt;}</code>
<code>\fparray_new:cn</code>	Evaluates the integer expression <code>&lt;size&gt;</code> and allocates an <code>&lt;fparray var&gt;</code> with that number of (zero) entries. The variable name should start with <code>\g_</code> because assignments are always global.
<hr/>	
New: 2018-05-05	

---

---

<code>\fparray_gzero:N</code>	<code>\fparray_gzero:N &lt;fparray var&gt;</code>
<code>\fparray_gzero:c</code>	Sets all entries of the <code>&lt;fparray var&gt;</code> to <code>+0</code> . Assignments are always global.
<hr/>	
New: 2018-05-05	

---

### 30.2 Adding data to floating point arrays

---

<code>\fparray_gset:Nnn</code>	<code>\fparray_gset:Nnn &lt;fparray var&gt; {&lt;position&gt;} {&lt;value&gt;}</code>
<code>\fparray_gset:cnn</code>	Stores the result of evaluating the floating point expression <code>&lt;value&gt;</code> into the <code>&lt;fparray var&gt;</code> at the (integer expression) <code>&lt;position&gt;</code> . If the <code>&lt;position&gt;</code> is not between 1 and the <code>\fparray_count:N</code> , an error occurs. Assignments are always global.
<hr/>	
New: 2018-05-05	

---

### 30.3 Counting entries in floating point arrays

---

<code>\fpararray_count:N</code>	★	<code>\fpararray_count:N</code> $\langle fpararray\ var \rangle$
<code>\fpararray_count:c</code>	★	Expands to the number of entries in the $\langle fpararray\ var \rangle$ . This is performed in constant time.
New: 2018-05-05		

---

### 30.4 Using a single entry

---

<code>\fpararray_item:Nn</code>	★	<code>\fpararray_item:Nn</code> $\langle fpararray\ var \rangle$ $\{ \langle position \rangle \}$
<code>\fpararray_item:cn</code>	★	Applies <code>\fp_use:N</code> or <code>\fp_to_tl:N</code> (respectively) to the floating point entry stored at the (integer expression) $\langle position \rangle$ in the $\langle fpararray\ var \rangle$ . If the $\langle position \rangle$ is not between 1 and the <code>\fpararray_count:N</code> $\langle fpararray\ var \rangle$ , an error occurs.
<code>\fpararray_item_to_tl:Nn</code>	★	
<code>\fpararray_item_to_tl:cn</code>	★	
New: 2018-05-05		

---

### 30.5 Floating point array conditional

<code>\fpararray_if_exist_p:N</code>	★	<code>\fpararray_if_exist_p:N</code> $\langle fpararray\ var \rangle$
<code>\fpararray_if_exist_p:c</code>	★	<code>\fpararray_if_exist:NTF</code> $\langle fpararray\ var \rangle$ $\{ \langle true\ code \rangle \}$ $\{ \langle false\ code \rangle \}$
<code>\fpararray_if_exist:NTF</code>	★	Tests whether the $\langle fpararray\ var \rangle$ is currently defined. This does not check that the $\langle fpararray\ var \rangle$ really is a floating point array variable.
<code>\fpararray_if_exist:cTF</code>	★	

---

New: 2024-03-31

## Chapter 31

# The **l3bitset** module

## Bitsets

This module defines and implements the data type **bitset**, a vector of bits. The size of the vector may grow dynamically. Individual bits can be set and unset by names pointing to an index position. The names **1**, **2**, **3**, ... are predeclared and point to the index positions 1, 2, 3, ... More names can be added and existing names can be changed. The index is like all other indices in **expl3** modules *1-based*. A **bitset** can be output as binary number or—as needed e.g. in a PDF dictionary—as decimal (arabic) number. Currently only a small subset of the functions provided by the **bitset** package are implemented here, mainly the functions needed to use bitsets in PDF dictionaries.

The **bitset** is stored as a string (but one shouldn't rely on the internal representation) and so the vector size is theoretically unlimited, only restricted by **TeX**-memory. But the functions to set and clear bits use integer functions for the index so bitsets can't be longer than  $2^{31} - 1$ . The export function **\bitset\_to\_arabic:N** can use functions from the **int** module only if the largest index used for this **bitset** is smaller than 32, for longer bitsets **fp** is used and this is slower.

## 31.1 Creating bitsets

---

```

\bitset_new:N \bitset_new:N <bitset var>
\bitset_new:c \bitset_new:Nn <bitset var>
\bitset_new:Nn {
\bitset_new:cn   <name1> = <index1> ,
                  <name2> = <index2> , ...
New: 2023-11-15 }

```

---

Creates a new *<bitset var>* or raises an error if the name is already taken. The declaration is global. The *<bitset var>* is initially 0.

Bitsets are implemented as string variables consisting of 1's and 0's. The rightmost number is the index position 1, so the string variable can be viewed directly as the binary number. But one shouldn't rely on the internal representation, but use the dedicated *\bitset\_to\_bin:N* instead to get the binary number.

The name-index pairs given in the second argument of *\bitset\_new:Nn* declares names for some indices, which can be used to set and unset bits. The names 1, 2, 3, ... are predeclared and point to the index positions 1, 2, 3, ...

*<index...>* should be a positive number or an *<integer expression>* which evaluates to a positive number. The expression is evaluated when the index is used, not at declaration time. The names *<name...>* should be unique. Using a number as name, e.g. 10=1, is allowed, it then overwrites the predeclared name 10, but the index position 10 can then only be reached if some other name for it exists, e.g. `ten=10`. It is not necessary to give every index a name, and an index can have more than one name. The named index can be extended or changed with the next function.

---

```

\bitset_addto_named_index:Nn \bitset_addto_named_index:Nn <bitset var>
New: 2023-11-15 {
                  <name1> = <index1> ,
                  <name2> = <index2> , ...
}

```

---

This extends or changes the name-index pairs for *<bitset var>* globally as described for *\bitset\_new:Nn*.

For example after these settings

```

\bitset_new:Nn \l_pdfannot_F_bitset
{
  Invisible      = 1,
  Hidden        = 2,
  Print          = 3,
  NoZoom         = 4,
  NoRotate       = 5,
  NoView         = 6,
  ReadOnly       = 7,
  Locked         = 8,
  ToggleNoView   = 9,
  LockedContents = 10
}
\bitset_addto_named_index:Nn \l_pdfannot_F_bitset
{

```

```

    print = 3
}

```

it is possible to set bit 3 by using any of these alternatives:

```

\bitset_set_true:Nn \l_pdfannot_F_bitset {Print}
\bitset_set_true:Nn \l_pdfannot_F_bitset {print}
\bitset_set_true:Nn \l_pdfannot_F_bitset {3}

```

---

```

\bitset_if_exist_p:N * \bitset_if_exist_p:N <bitset var>
\bitset_if_exist_p:c * \bitset_if_exist:NNTF <bitset var> {<true code>} {<false code>}
\bitset_if_exist:NNTF * Tests whether the <bitset var> exist.
\bitset_if_exist:cNTF *

```

---

New: 2023-11-15

---

## 31.2 Setting and unsetting bits

---

```

\bitset_set_true:Nn \bitset_set_true:Nn <bitset var> {<name>}
\bitset_set_true:cn
\bitset_gset_true:Nn
\bitset_gset_true:cn

```

---

This sets the bit of the index position represented by {<name>} to 1. <name> should be either one of the predeclared names 1, 2, 3, ..., or one of the names added manually. Index position are 1-based. If needed the length of the bit vector is enlarged.

---

New: 2023-11-15

---

---

```

\bitset_set_false:Nn \bitset_set_false:Nn <bitset var> {<name>}
\bitset_set_false:cn
\bitset_gset_false:Nn
\bitset_gset_false:cn

```

---

This unsets the bit of the index position represented by {<name>} (sets it to 0). <name> should be either one of the predeclared names 1, 2, 3, ..., or one of the names added manually. The index is 1-based. If the index position is larger than the current length of the bit vector nothing happens. If the leading (left most) bit is unset, zeros are not trimmed but stay in the bit vector and are still shown by \bitset\_show:N.

---

New: 2023-11-15

---

---

```

\bitset_clear:N \bitset_clear:N <bitset var>
\bitset_clear:c
\bitset_gclear:N
\bitset_gclear:c

```

---

This resets the bitset to the initial state. The declared names are not changed.

---

New: 2023-11-15

---

## 31.3 Using bitsets

---

```

\bitset_item:Nn * \bitset_item:Nn <bitset var> {<name>}
\bitset_item:cn *

```

---

\bitset\_item:Nn outputs 1 if the bit with the index number represented by <name> is set and 0 otherwise. <name> is either one of the predeclared names 1, 2, 3, ..., or one of the names added manually.

---

New: 2023-11-15

---

---

<code>\bitset_to_bin:N</code>	★	<code>\bitset_to_bin:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_to_bin:c</code>	★	This leaves the current value of the bitset expressed as a binary (string) number in the input stream. If no bit has been set yet, the output is zero.

---

New: 2023-11-15

---

---

<code>\bitset_to_arabic:N</code>	★	<code>\bitset_to_arabic:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_to_arabic:c</code>	★	This leaves the current value of the bitset expressed as a decimal number in the input stream. If no bit has been set yet, the output is zero. The function uses <code>\int_from_bin:n</code> if the largest index that have been set or unset is smaller than 32, and a slower implementation based on <code>\fp_eval:n</code> otherwise.

---

New: 2023-11-15

---

---

<code>\bitset_use:N</code>	★	<code>\bitset_use:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_use:c</code>	★	This leaves the current value of the bitset expressed as a binary (string) number in the input stream. If no bit has been set yet, the output is zero. This is functionally equivalent to <code>\bitset_to_bin:N</code> .

---

New: 2024-11-12

---

---

<code>\bitset_show:N</code>		<code>\bitset_show:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_show:c</code>		Displays the binary and decimal values of the <i>&lt;bitset var&gt;</i> on the terminal.

---

New: 2023-11-15

---

---

<code>\bitset_log:N</code>		<code>\bitset_log:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_log:c</code>		Writes the binary and decimal values of the <i>&lt;bitset var&gt;</i> in the log file.

---

New: 2023-11-15

---

---

<code>\bitset_show_named_index:N</code>		<code>\bitset_show_named_index:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_show_named_index:c</code>		Displays declared name-index pairs of the <i>&lt;bitset var&gt;</i> on the terminal.

---

New: 2023-11-15

---

---

<code>\bitset_log_named_index:N</code>		<code>\bitset_log_named_index:N</code> <i>&lt;bitset var&gt;</i>
<code>\bitset_log_named_index:c</code>		Writes declared name-index pairs of the <i>&lt;bitset var&gt;</i> in the log file.

---

New: 2023-12-11

---

## Chapter 32

# The `\l3cctab` module

## Category code tables

A category code table enables rapid switching of all category codes in one operation. For Lua $\TeX$ , this is possible over the entire Unicode range. For other engines, only the 8-bit range (0–255) is covered by such tables. The implementation of category code tables in `expl3` also saves and restores the  $\TeX$  `\endlinechar` primitive value, meaning they could be used for example to implement `\ExplSyntaxOn`.

### 32.1 Creating and initialising category code tables

---

<code>\cctab_new:N</code>	<code>\cctab_new:N &lt;category code table&gt;</code>
<code>\cctab_new:c</code>	Creates a new <code>&lt;category code table&gt;</code> variable or raises an error if the name is already taken. The declaration is global. The <code>&lt;category code table&gt;</code> is initialised with the codes as used by <code>ini<math>\TeX</math></code> .
<hr/>	
<code>Updated: 2020-07-02</code>	

---

<code>\cctab_const:Nn</code>	<code>\cctab_const:Nn &lt;category code table&gt; {&lt;category code set up&gt;}</code>
<code>\cctab_const:cn</code>	Creates a new <code>&lt;category code table&gt;</code> , applies (in a group) the <code>&lt;category code set up&gt;</code> on top of <code>ini<math>\TeX</math></code> settings, then saves them globally as a constant table. The <code>&lt;category code set up&gt;</code> can include a call to <code>\cctab_select:N</code> .
<hr/>	
<code>Updated: 2020-07-07</code>	

---

<code>\cctab_gset:Nn</code>	<code>\cctab_gset:Nn &lt;category code table&gt; {&lt;category code set up&gt;}</code>
<code>\cctab_gset:cn</code>	Starting from the <code>ini<math>\TeX</math></code> category codes, applies (in a group) the <code>&lt;category code set up&gt;</code> , then saves them globally in the <code>&lt;category code table&gt;</code> . The <code>&lt;category code set up&gt;</code> can include a call to <code>\cctab_select:N</code> .
<hr/>	
<code>Updated: 2020-07-07</code>	

---

<code>\cctab_gsave_current:N</code>	<code>\cctab_gsave_current:N &lt;category code table&gt;</code>
<code>\cctab_gsave_current:c</code>	Saves the current prevailing category codes in the <code>&lt;category code table&gt;</code> .
<hr/>	
<code>New: 2023-05-26</code>	

---

## 32.2 Using category code tables

<hr/> <code>\cctab_begin:N</code> <hr/>	<code>\cctab_begin:N</code> $\langle$ category code table $\rangle$
<code>\cctab_begin:c</code> <hr/>	Switches locally the category codes in force to those stored in the $\langle$ category code table $\rangle$ . The prevailing codes before the function is called are added to a stack, for use with <code>\cctab_end:</code> . This function does not start a T <sub>E</sub> X group.
Updated: 2020-07-02	
<hr/> <code>\cctab_end:</code> <hr/>	<code>\cctab_end:</code>
Updated: 2020-07-02	Ends the scope of a $\langle$ category code table $\rangle$ started using <code>\cctab_begin:N</code> , returning the codes to those in force before the matching <code>\cctab_begin:N</code> was used. This must be used within the same T <sub>E</sub> X group and at the same T <sub>E</sub> X group level as the matching <code>\cctab_begin:N</code> .
<hr/> <code>\cctab_select:N</code> <hr/>	<code>\cctab_select:N</code> $\langle$ category code table $\rangle$
<code>\cctab_select:c</code> <hr/>	Selects the $\langle$ category code table $\rangle$ for the scope of the current group. This is in particular useful in the $\langle$ setup $\rangle$ arguments of <code>\tl_set_rescan:Nnn</code> , <code>\tl_rescan:nn</code> , <code>\cctab_const:Nn</code> , and <code>\cctab_gset:Nn</code> .
New: 2020-05-19	
Updated: 2020-07-02	
<hr/> <code>\cctab_item:Nn</code> *	<code>\cctab_item:Nn</code> $\langle$ category code table $\rangle$ $\{\langle$ int expr $\rangle\}$
<code>\cctab_item:cn</code> *	Determines the $\langle$ character $\rangle$ with character code given by the $\langle$ int expr $\rangle$ and expands to its category code specified by the $\langle$ category code table $\rangle$ .
New: 2021-05-10	

## 32.3 Category code table conditionals

<hr/> <code>\cctab_if_exist_p:N</code> *	<code>\cctab_if_exist_p:N</code> $\langle$ category code table $\rangle$
<code>\cctab_if_exist_p:c</code> *	<code>\cctab_if_exist:NTF</code> $\langle$ category code table $\rangle$ $\{\langle$ true code $\rangle\}$ $\{\langle$ false code $\rangle\}$
<code>\cctab_if_exist:NTF</code> *	Tests whether the $\langle$ category code table $\rangle$ is currently defined. This does not check that the $\langle$ category code table $\rangle$ really is a category code table.
<code>\cctab_if_exist:cTF</code> *	

## 32.4 Constant and scratch category code tables

<hr/> <code>\c_code_cctab</code> <hr/>	Category code table for the expl3 code environment; this does <i>not</i> include <code>@</code> , which is retained as an “other” character. Sets the <code>\endlinechar</code> value to 32 (a space).
Updated: 2020-07-10	
<hr/> <code>\c_document_cctab</code> <hr/>	Category code table for a standard L <sup>A</sup> T <sub>E</sub> X document, as set by the L <sup>A</sup> T <sub>E</sub> X kernel. In particular, the upper-half of the 8-bit range will be set to “active” with pdfT <sub>E</sub> X <i>only</i> . No babel shorthands will be activated. Sets the <code>\endlinechar</code> value to 13 (normal line ending).
Updated: 2020-07-08	

---

**\c\_initex\_cctab** Category code table as set up by `iniTEX`.  

---

Updated: 2020-07-02

---

---

**\c\_other\_cctab** Category code table where all characters have category code 12 (other). Sets the `\endlinechar` value to `-1`.  

---

Updated: 2020-07-02

---

---

**\c\_str\_cctab** Category code table where all characters have category code 12 (other) with the exception of spaces, which have category code 10 (space). Sets the `\endlinechar` value to `-1`.  

---

Updated: 2020-07-02

---

---

**\g\_tmpa\_cctab** Scratch category code tables.  
**\g\_tmpb\_cctab**  

---

New: 2023-05-26

---

Part V

# Text manipulation

## Chapter 33

# The `l3unicode` module

## Unicode support functions

This module provides Unicode-specific functions along with loading data from a range of Unicode Consortium files. Most of the code here is internal, but there are a small set of public functions. These work with Unicode *codepoints* and are designed to give usable results with both Unicode-aware and 8-bit engines.

---

`\codepoint_generate:nn` ★ `\codepoint_generate:nn {⟨codepoint⟩} {⟨catcode⟩}`

---

New: 2022-10-09  
Updated: 2022-11-09

Generates one or more character tokens representing the `⟨codepoint⟩`. With Unicode engines, exactly one character token will be generated, and this will have the `⟨catcode⟩` specified as the second argument:

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the `⟨codepoint⟩`. For all codepoints outside of the classical ASCII range, the generated character tokens will be active (category code 13); for codepoints in the ASCII range, the given `⟨catcode⟩` will be used. To allow the result of this function to be used inside an expansion context, the result is protected by `\exp_not:n`.

**TeXhackers note:** Users of (u)pTeX note that these engines are treated as 8-bit in this context. In particular, for upTeX, irrespective of the `\kcatcode` of the `⟨codepoint⟩`, any value outside the ASCII range will result in a series of active bytes being generated.

---

`\codepoint_str_generate:n` ★ `\codepoint_str_generate:n {⟨codepoint⟩}`

---

New: 2022-10-09

Generates one or more character tokens representing the `⟨codepoint⟩`. With Unicode engines, exactly one character token will be generated. For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the `⟨codepoint⟩`. All of the generated character tokens will be of category code 12, except any spaces (codepoint 32), which will be category code 10.

<hr/>	
<code>\codepoint_to_category:n</code> ★	<code>\codepoint_to_category:n {⟨codepoint⟩}</code>
<hr/>	
New: 2023-06-19	Expands to the Unicode general category identifier of the <code>⟨codepoint⟩</code> . The general category identifier is a string made up of two letter characters, the first uppercase and the second lowercase. The uppercase letters divide codepoints into broader groups, which are then refined by the lowercase letter. For example, codepoints representing letters all have identifiers starting L, for example Lu (uppercase letter), Lt (titlecase letter), etc. Full details are available in the documentation provided by the Unicode Consortium: see <a href="https://www.unicode.org/reports/tr44/#General_Category_Values">https://www.unicode.org/reports/tr44/#General_Category_Values</a>
<hr/>	
<code>\codepoint_to_nfd:n</code> ★	<code>\codepoint_to_nfd:n {⟨codepoint⟩}</code>
<hr/>	
New: 2022-10-09	Converts the <code>⟨codepoint⟩</code> to the Unicode Normalization Form Canonical Decomposition. The generated character(s) will have the current category code as they would if typed in directly for Unicode engines; for 8-bit engines, active characters are used for all codepoints outside of the ASCII range.
<hr/>	

## Chapter 34

# The l3text module

## Text processing

This module deals with manipulation of (formatted) text; such material is comprised of a restricted set of token list content. The functions provided here concern conversion of textual content for example in case changing, generation of bookmarks and extraction to tags. All of the major functions operate by expansion. Begin-group and end-group tokens in the  $\langle text \rangle$  are normalized and become  $\{$  and  $\}$ , respectively.

### 34.1 Expanding text

---

$\text{\textbackslash text\_expand:n}$ ★	$\text{\textbackslash text\_expand:n}$ $\{ \langle text \rangle \}$
--	---

---

New: 2020-01-02
Updated: 2023-06-09

---

Takes user input  $\langle text \rangle$  and expands the content. Protected commands (typically formatting) are left in place, and no processing of math mode material (as delimited by pairs given in  $\text{\textbackslash l\_text\_math\_delims\_tl}$  or as the argument to commands listed in  $\text{\textbackslash l\_text\_math\_arg\_tl}$ ) takes place. Commands which are neither engine- nor L<sup>A</sup>T<sub>E</sub>X-protected are expanded exhaustively. Any commands listed in  $\text{\textbackslash l\_text\_expand\_exclude\_tl}$  are excluded from expansion, as are those in  $\text{\textbackslash l\_text\_case\_exclude\_arg\_tl}$  and  $\text{\textbackslash l\_text\_math\_arg\_tl}$ .

---

$\text{\textbackslash text\_declare\_expand\_equivalent:Nn}$	$\text{\textbackslash text\_declare\_expand\_equivalent:Nn}$ $\langle cmd \rangle$ $\{ \langle replacement \rangle \}$
$\text{\textbackslash text\_declare\_expand\_equivalent:cn}$	

---

New: 2020-01-22
-----------------

---

Declares that the  $\langle replacement \rangle$  tokens should be used whenever the  $\langle cmd \rangle$  (a single token) is encountered. The  $\langle replacement \rangle$  tokens should be expandable. A token can be “replaced” by itself if the defined replacement wraps it in  $\text{\textbackslash exp\_not:n}$ , for example

$$\text{\textbackslash text\_declare\_expand\_equivalent:Nn} \text{\textbackslash ' } \{ \text{\textbackslash exp\_not:n} \{ \text{\textbackslash ' } \} \}$$

## 34.2 Case changing

---

<code>\text_lowercase:n</code>	* <code>\text_uppercase:n</code> $\{\langle tokens \rangle\}$
<code>\text_uppercase:n</code>	* <code>\text_uppercase:nn</code> $\{\langle BCP-47 \rangle\}$ $\{\langle tokens \rangle\}$
<code>\text_titlecase_all:n</code>	* Takes user input $\langle text \rangle$ first applies <code>\text_expand:n</code> , then transforms the case of character tokens as specified by the function name. The category code of letters are not
<code>\text_titlecase_first:n</code>	* changed by this process when Unicode engines are used; in 8-bit engines, case changed
<code>\text_lowercase:nn</code>	* characters in the ASCII range will have the current prevailing category code, while those
<code>\text_uppercase:nn</code>	* outside of it will be represented by active characters.
<code>\text_titlecase_all:nn</code>	
<code>\text_titlecase_first:nn</code>	

---

New: 2019-11-20

Updated: 2023-07-08

---

Upper- and lowercase have the obvious meanings. Titlecasing may be regarded informally as converting the first *non-space* character of the  $\langle tokens \rangle$  to uppercase. However, the process is more complex than this as there are some situations where a single lowercase character maps to a special form, for example *ij* in Dutch which becomes *IJ*. There are two functions available for titlecasing: one which applies the change to each “word” and a second which only applies at the start of the input. (Here, “word” boundaries are spaces: at present, full Unicode word breaking is not attempted.)

Importantly, notice that these functions are intended for working with user *text for typesetting*. For case changing programmatic data see the `l3str` module and discussion there of `\str_lowercase:n`, `\str_uppercase:n` and `\str_casefold:n`.

Case changing does not take place within math mode material so for example

```
\text_uppercase:n { Some~text~$y = mx + c$~with~{Braces} }
```

becomes

```
SOME TEXT $y = mx + c$ WITH {BRACES}
```

The first mandatory argument of commands listed in `\l_text_case_exclude_arg_tl` is excluded from case changing; the latter are entirely non-textual content (such as labels).

The standard mappings here follow those defined by the [Unicode Consortium](#) in `UnicodeData.txt` and `SpecialCasing.txt`. For  $\text{\pTeX}$ , only the ASCII range is covered as the engine treats input outside of this range as east Asian.

Locale-sensitive conversions are enabled using the  $\langle BCP-47 \rangle$  argument, and follow Unicode Consortium guidelines. Currently, the locale strings recognized for special handling are as follows.

- Armenian (`hy` and `hy-x-yiwn`) The setting `hy` maps the codepoint U+0587, the ligature of letters *ech* and *yiwn*, to the codepoints for capital *ech* and *vew* when uppercasing; this follows the spelling reform which is used in Armenia. The alternative `hy-x-yiwn` maps U+0587 to capital *ech* and *yiwn* on uppercasing (also the output if Armenian is not selected at all).
- Azeri and Turkish (`az` and `tr`). The case pairs *I/i-dotless* and *I-dot/i* are activated for these languages. The combining dot mark is removed when lowercasing *I-dot* and introduced when upper casing *i-dotless*.
- German (`de-x-eszett`). An alternative mapping for German in which the lower-case *Eszett* maps to a *großes Eszett*.

- Greek (**e1**). Removes accents from Greek letters when uppercasing; titlecasing leaves accents in place. A variant **e1-x-iota** is available which converts the *ypogegrammeni* (subscript muted iota) to capital iota when uppercasing: the standard version retains the subscript versions.
- Lithuanian (**1t**). The lowercase letters i and j should retain a dot above when the accents grave, acute or tilde are present. This is implemented for lowercasing of the relevant uppercase letters both when input as single Unicode codepoints and when using combining accents. The combining dot is removed when uppercasing in these cases. Note that *only* the accents used in Lithuanian are covered: the behaviour of other accents are not modified.
- Medieval Latin (**1a-x-medieval**). The characters u and V are interchanged on case changing.
- Dutch (**n1**). Capitalisation of ij at the beginning of titlecased input produces IJ rather than Ij.

Determining whether non-letter characters at the start of text should count as the uppercase element is controllable. When `\l_text_titlecase_check_letter_bool` is **true**, codepoints which are not letters (Unicode general category L) are not changed, and only the first *letter* is uppercased. When `\l_text_titlecase_check_letter_bool` is **false**, the first codepoint is uppercased, irrespective of the general code of the character.

---

```
\text_declare_case_equivalent:Nn \text_declare_case_equivalent:Nn <cmd> {\replacement}
```

---

New: 2022-07-04

Declares that the `<replacement>` tokens should be used whenever the `<cmd>` (a single token) is encountered during case changing.

---

```
\text_declare_lowercase_mapping:nn \text_declare_lowercase_mapping:nn {\codepoint} {\replacement}
\text_declare_lowercase_mapping:nnn \text_declare_lowercase_mapping:nnn {\BCP-47} {\codepoint}
\text_declare_titlecase_mapping:nn {\replacement}
\text_declare_titlecase_mapping:nnn
\text_declare_uppercase_mapping:nn
\text_declare_uppercase_mapping:nnn
```

---

New: 2023-04-11

Updated: 2023-04-20

Declares that the `<replacement>` tokens should be used when case mapping the `<codepoint>`, rather than the standard mapping given in the Unicode data files. The **nnn** version takes a BCP-47 tag, which can be used to specify that the customisation only applies to that locale.

---

```
\text_case_switch:nnnn * \text_case_switch:nnnn {\normal} {\upper} {\lower} {\title}
```

---

New: 2022-07-04

Context-sensitive function which will expand to one of the `<normal>`, `<upper>`, `<lower>` or `<title>` tokens depending on the current case changing operation. Outside of case changing, the `<normal>` tokens are produced. Within case changing, the appropriate mapping tokens are inserted.

## 34.3 Removing formatting from text

---

`\text_purify:n` ★ `\text_purify:n {<text>}`

---

New: 2020-03-05 Takes user input `<text>` and expands as described for `\text_expand:n`, then removes all functions from the resulting text. Math mode material (as delimited by pairs given in `\l_text_math_delims_tl` or as the argument to commands listed in `\l_text_math_arg_tl`) is left contained in a pair of \$ delimiters. Non-expandable functions present in the `<text>` must either have a defined equivalent (see `\text_declare_purify_equivalent:Nn`) or will be removed from the result. Implicit tokens are converted to their explicit equivalent.

---

Updated: 2020-05-14

---

`\text_declare_purify_equivalent:Nn` `\text_declare_purify_equivalent:Nn <cmd> {<replacement>}`  
`\text_declare_purify_equivalent:Ne`

---

New: 2020-03-05

---

Declares that the `<replacement>` tokens should be used whenever the `<cmd>` (a single token) is encountered. The `<replacement>` tokens should be expandable.

## 34.4 Control variables

---

`\l_text_math_arg_tl` Lists commands present in the `<text>` where the argument of the command should be treated as math mode material. The treatment here is similar to `\l_text_math_delims_tl` but for a command rather than paired delimiters.

---

---

`\l_text_math_delims_tl` Lists pairs of tokens which delimit (in-line) math mode content; such content *may* be excluded from processing.

---

---

`\l_text_case_exclude_arg_tl`

---

Lists commands where the first mandatory argument is excluded from case changing.

---

`\l_text_expand_exclude_tl` Lists commands which are excluded from expansion. This protection includes everything up to and including their first braced argument.

---

---

`\l_text_titlecase_check_letter_bool`

---

Controls how the start of titlecasing is handled: when `true`, the first *letter* in text is considered. The standard setting is `true`.

## 34.5 Mapping to text

Grapheme splitting is implemented using the algorithm described in Unicode Standard Annex #29. This includes support for extended grapheme clusters. Leading line feeds or carriage returns will be dropped due to standard TeX processing. At present extended pictograms are not supported: these may be added in a future release. Some aspects of Indic grapheme breaking, introduced in Unicode 15, are also currently absent.

---

<code>\text_map_function:nN</code> ☆	<code>\text_map_function:nN {&lt;text&gt;} &lt;function&gt;</code>
--------------------------------------	--

---

New: 2022-08-04

This takes the user input in `<text>` and expands it as with `\text_expand:n`; it then maps over the *graphemes* within the result, passing each grapheme to the `<function>`. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The `<function>` should accept one argument as `<balanced text>`: this may comprise codepoints or it may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_map_inline:nn`.

---

<code>\text_map_inline:nn</code>	<code>\text_map_inline:nn {&lt;text&gt;} {&lt;inline function&gt;}</code>
----------------------------------	---

---

New: 2022-08-04

This takes the user input in `<text>` and expands it as with `\text_expand:n`; it then maps over the *graphemes* within the result, passing each grapheme to the `<inline function>`. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The `<inline function>` should consist of code which receives the grapheme as `<balanced text>`: this may comprise codepoints or it may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_map_function:nN`.

Word breaking is implemented using the standard algorithm described in Unicode Standard Annex #29. Leading line feeds or carriage returns will be dropped due to standard TeX processing. Spaces are always considered a break even if immediately followed by an extending character. At present extended pictograms are not supported: these may be added in a future release. Language-based tailoring may be added in a future release: at present the algorithm is exactly that described in the annex.

---

<code>\text_words_map_function:nN</code> ☆	<code>\text_words_map_function:nN {&lt;text&gt;} &lt;function&gt;</code>
--	--

---

New: 2025-02-12

This takes the user input in `<text>` and expands it as with `\text_expand:n`; it then maps over the *words* within the result, passing each word to the `<function>`. Word boundaries are determined using the standard algorithm described by the Unicode Consortium. The `<function>` should accept one argument as `<balanced text>`: this may comprise codepoints or it may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_words_map_inline:nn`.

---

<code>\text_words_map_inline:n</code>	☆	<code>\text_words_map_inline:nn</code>	{ <i>⟨text⟩</i> }	{ <i>⟨inline function⟩</i> }
---------------------------------------	---	--	-------------------	------------------------------

---

New: 2025-02-12

This takes the user input in *⟨text⟩* and expands it as with `\text_expand:n`; it then maps over the *words* within the result, passing each word to the *⟨function⟩*. Word boundaries are determined using the standard algorithm described by the Unicode Consortium. The *⟨inline function⟩* should consist of code that will accept one argument as *⟨balanced text⟩*: this may comprise codepoints or it may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_words_map_function:nN`.

---

<code>\text_map_break:</code>	☆	<code>\text_map_break:</code>	
<code>\text_map_break:n</code>	☆	<code>\text_map_break:n</code>	{ <i>⟨code⟩</i> }

---

New: 2022-08-04

Used to terminate a `\text_map...` or `\text_words_map...` function before all entries in the *⟨text⟩* have been processed. This normally takes place within a conditional statement.

Part VI

# Typesetting

## Chapter 35

# The **l3box** module

## Boxes

Box variables contain typeset material that can be inserted on the page or in other boxes. Their contents cannot be converted back to lists of tokens. There are three kinds of box operations: horizontal mode denoted with prefix `\hbox_`, vertical mode with prefix `\vbox_`, and the generic operations working in both modes with prefix `\box_`. For instance, a new box variable containing the words “Hello, world!” (in a horizontal box) can be obtained by the following code.

```
\box_new:N \l_hello_box
\hbox_set:Nn \l_hello_box { Hello, ~ world! }
```

The argument is typeset inside a  $\TeX$  group so that any variables assigned during the construction of this box restores its value afterwards.

Box variables from **l3box** are compatible with those of  $\text{\LaTeX}2_{\varepsilon}$  and plain  $\TeX$  and can be used interchangeably. The **l3box** commands to construct boxes, such as `\hbox:n` or `\hbox_set:Nn`, are “color-safe”, meaning that

```
\hbox:n { \color_select:n { blue } Hello, } ~ world!
```

will result in “Hello,” taking the color blue, but “world!” remaining with the prevailing color outside the box.

### 35.1 Creating and initialising boxes

---

<code>\box_new:N</code>	<code>\box_new:N &lt;box&gt;</code>
-------------------------	-------------------------------------

<code>\box_new:c</code>	Creates a new <code>&lt;box&gt;</code> or raises an error if the name is already taken. The declaration is global. The <code>&lt;box&gt;</code> is initially void.
-------------------------	--

---

<code>\box_clear:N</code>	<code>\box_clear:N &lt;box&gt;</code>
---------------------------	---------------------------------------

<code>\box_clear:c</code>	Clears the content of the <code>&lt;box&gt;</code> by setting the box equal to <code>\c_empty_box</code> .
---------------------------	--

<code>\box_gclear:N</code>	
<code>\box_gclear:c</code>	

---

<hr/>	
<code>\box_clear_new:N</code>	<code>\box_clear_new:N &lt;box&gt;</code>
<code>\box_clear_new:c</code>	
<code>\box_gclear_new:N</code>	Ensures that the <code>&lt;box&gt;</code> exists globally by applying <code>\box_new:N</code> if necessary, then applies
<code>\box_gclear_new:c</code>	<code>\box_(g)clear:N</code> to leave the <code>&lt;box&gt;</code> empty.
<hr/>	
<code>\box_set_eq:NN</code>	<code>\box_set_eq:NN &lt;box<sub>1</sub>&gt; &lt;box<sub>2</sub>&gt;</code>
<code>\box_set_eq:(cN Nc cc)</code>	
<code>\box_gset_eq:NN</code>	Sets the content of <code>&lt;box<sub>1</sub>&gt;</code> equal to that of <code>&lt;box<sub>2</sub>&gt;</code> .
<code>\box_gset_eq:(cN Nc cc)</code>	
<hr/>	
<code>\box_if_exist_p:N</code>	<code>\box_if_exist_p:N &lt;box&gt;</code>
<code>\box_if_exist_p:c</code>	<code>\box_if_exist:NTF &lt;box&gt; {(true code)} {(false code)}</code>
<code>\box_if_exist:N<math>\underline{T}</math><math>\underline{F}</math></code>	<code>*</code>
<code>\box_if_exist:c<math>\underline{T}</math><math>\underline{F}</math></code>	<code>*</code>
	Tests whether the <code>&lt;box&gt;</code> is currently defined. This does not check that the <code>&lt;box&gt;</code> really is a box.
<hr/>	
New: 2012-03-03	
<hr/>	

## 35.2 Using boxes

<hr/>	
<code>\box_use:N</code>	<code>\box_use:N &lt;box&gt;</code>
<code>\box_use:c</code>	
	Inserts the current content of the <code>&lt;box&gt;</code> onto the current list for typesetting. An error is raised if the variable does not exist or if it is invalid.
<hr/>	

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\copy`.

<hr/>	
<code>\box_move_right:nn</code>	<code>\box_move_right:nn {&lt;dim expr&gt;} {&lt;box function&gt;}</code>
<code>\box_move_left:nn</code>	
	This function operates in vertical mode, and inserts the material specified by the <code>&lt;box function&gt;</code> such that its reference point is displaced horizontally by the given <code>&lt;dim expr&gt;</code> from the reference point for typesetting, to the right or left as appropriate. The <code>&lt;box function&gt;</code> should be a box operation such as <code>\box_use:N \&lt;box&gt;</code> or a “raw” box specification such as <code>\vbox:n { xyz }</code> .
<hr/>	
<code>\box_move_up:nn</code>	<code>\box_move_up:nn {&lt;dim expr&gt;} {&lt;box function&gt;}</code>
<code>\box_move_down:nn</code>	
	This function operates in horizontal mode, and inserts the material specified by the <code>&lt;box function&gt;</code> such that its reference point is displaced vertically by the given <code>&lt;dim expr&gt;</code> from the reference point for typesetting, up or down as appropriate. The <code>&lt;box function&gt;</code> should be a box operation such as <code>\box_use:N \&lt;box&gt;</code> or a “raw” box specification such as <code>\vbox:n { xyz }</code> .
<hr/>	

## 35.3 Measuring and setting box dimensions

---

`\box_dp:N` `\box_dp:N`  $\langle box \rangle$

`\box_dp:c` Calculates the depth (below the baseline) of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dim\ expr \rangle$ .

**TeXhackers note:** This is the TeX primitive `\dp`.

---

`\box_ht:N` `\box_ht:N`  $\langle box \rangle$

`\box_ht:c` Calculates the height (above the baseline) of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dim\ expr \rangle$ .

**TeXhackers note:** This is the TeX primitive `\ht`.

---

`\box_wd:N` `\box_wd:N`  $\langle box \rangle$

`\box_wd:c` Calculates the width of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dim\ expr \rangle$ .

**TeXhackers note:** This is the TeX primitive `\wd`.

---

`\box_ht_plus_dp:N` `\box_ht_plus_dp:N`  $\langle box \rangle$

`\box_ht_plus_dp:c` Calculates the total vertical size (height plus depth) of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dim\ expr \rangle$ .  
New: 2021-05-05

---

`\box_set_dp:Nn` `\box_set_dp:Nn`  $\langle box \rangle$   $\{\langle dim\ expr \rangle\}$

`\box_set_dp:cn` Set the depth (below the baseline) of the  $\langle box \rangle$  to the value of the  $\{\langle dim\ expr \rangle\}$ .

`\box_gset_dp:Nn`

`\box_gset_dp:cn`

---

Updated: 2019-01-22

---

`\box_set_ht:Nn` `\box_set_ht:Nn`  $\langle box \rangle$   $\{\langle dim\ expr \rangle\}$

`\box_set_ht:cn` Set the height (above the baseline) of the  $\langle box \rangle$  to the value of the  $\{\langle dim\ expr \rangle\}$ .

`\box_gset_ht:Nn`

`\box_gset_ht:cn`

---

Updated: 2019-01-22

---

`\box_set_wd:Nn` `\box_set_wd:Nn`  $\langle box \rangle$   $\{\langle dim\ expr \rangle\}$

`\box_set_wd:cn` Set the width of the  $\langle box \rangle$  to the value of the  $\{\langle dim\ expr \rangle\}$ .

`\box_gset_wd:Nn`

`\box_gset_wd:cn`

---

Updated: 2019-01-22

## 35.4 Box conditionals

---

<code>\box_if_empty_p:N</code>	<code>*</code>	<code>\box_if_empty_p:N</code>	<code>&lt;box&gt;</code>
<code>\box_if_empty_p:c</code>	<code>*</code>	<code>\box_if_empty:NTF</code>	<code>&lt;box&gt; {\true code} {\false code}</code>
<code>\box_if_empty:NTF</code>	<code>*</code>	Tests if <code>&lt;box&gt;</code> is a empty (equal to <code>\c_empty_box</code> ).	
<code>\box_if_empty:cTF</code>	<code>*</code>		

---

---

<code>\box_if_horizontal_p:N</code>	<code>*</code>	<code>\box_if_horizontal_p:N</code>	<code>&lt;box&gt;</code>
<code>\box_if_horizontal_p:c</code>	<code>*</code>	<code>\box_if_horizontal:NTF</code>	<code>&lt;box&gt; {\true code} {\false code}</code>
<code>\box_if_horizontal:NTF</code>	<code>*</code>	Tests if <code>&lt;box&gt;</code> is a horizontal box.	
<code>\box_if_horizontal:cTF</code>	<code>*</code>		

---

---

<code>\box_if_vertical_p:N</code>	<code>*</code>	<code>\box_if_vertical_p:N</code>	<code>&lt;box&gt;</code>
<code>\box_if_vertical_p:c</code>	<code>*</code>	<code>\box_if_vertical:NTF</code>	<code>&lt;box&gt; {\true code} {\false code}</code>
<code>\box_if_vertical:NTF</code>	<code>*</code>	Tests if <code>&lt;box&gt;</code> is a vertical box.	
<code>\box_if_vertical:cTF</code>	<code>*</code>		

---

## 35.5 The last box inserted

---

<code>\box_set_to_last:N</code>	<code>*</code>	<code>\box_set_to_last:N</code>	<code>&lt;box&gt;</code>
<code>\box_set_to_last:c</code>	<code>*</code>	Sets the <code>&lt;box&gt;</code> equal to the last item (box) added to the current partial list, removing the item from the list at the same time. When applied to the main vertical list, the <code>&lt;box&gt;</code> is always void as it is not possible to recover the last added item.	
<code>\box_gset_to_last:N</code>	<code>*</code>		
<code>\box_gset_to_last:c</code>	<code>*</code>		

---

## 35.6 Constant boxes

---

<code>\c_empty_box</code>	This is a permanently empty box, which is neither set as horizontal nor vertical.
Updated: 2012-11-04	<b>TeXhackers note:</b> At the TeX level this is a void box.

---

## 35.7 Scratch boxes

---

<code>\l_tmpa_box</code>	Scratch boxes for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_box</code>	
Updated: 2012-11-04	

---

---

<code>\g_tmpa_box</code>	Scratch boxes for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_box</code>	

---

## 35.8 Viewing box contents

<hr/> <code>\box_show:N</code> <hr/>	<code>\box_show:N &lt;box&gt;</code>
<code>\box_show:c</code> <hr/>	Shows full details of the content of the <code>&lt;box&gt;</code> in the terminal.
<hr/> Updated: 2012-05-11 <hr/>	
<hr/> <code>\box_show:Nnn</code> <hr/>	<code>\box_show:Nnn &lt;box&gt; {\int expr_1} {\int expr_2}</code>
<code>\box_show:cnn</code> <hr/>	Display the contents of <code>&lt;box&gt;</code> in the terminal, showing the first <code>&lt;int expr_1&gt;</code> items of the box, and descending into <code>&lt;int expr_2&gt;</code> group levels.
<hr/> New: 2012-05-11 <hr/>	
<hr/> <code>\box_log:N</code> <hr/>	<code>\box_log:N &lt;box&gt;</code>
<code>\box_log:c</code> <hr/>	Writes full details of the content of the <code>&lt;box&gt;</code> to the log.
<hr/> New: 2012-05-11 <hr/>	
<hr/> <code>\box_log:Nnn</code> <hr/>	<code>\box_log:Nnn &lt;box&gt; {\int expr_1} {\int expr_2}</code>
<code>\box_log:cnn</code> <hr/>	Writes the contents of <code>&lt;box&gt;</code> to the log, showing the first <code>&lt;int expr_1&gt;</code> items of the box, and descending into <code>&lt;int expr_2&gt;</code> group levels.
<hr/> New: 2012-05-11 <hr/>	

## 35.9 Boxes and color

All L<sup>A</sup>T<sub>E</sub>X3 boxes are “color safe”: a color set inside the box stops applying after the end of the box has occurred.

### 35.10 Horizontal mode boxes

<hr/> <code>\hbox:n</code> <hr/>	<code>\hbox:n {\contents}</code>
<hr/> Updated: 2017-04-05 <hr/>	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of natural width and then includes this box in the current list for typesetting.
<hr/> <code>\hbox_to_wd:nn</code> <hr/>	<code>\hbox_to_wd:nn {\dim expr} {\contents}</code>
<hr/> Updated: 2017-04-05 <hr/>	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of width <code>&lt;dim expr&gt;</code> and then includes this box in the current list for typesetting.
<hr/> <code>\hbox_to_zero:n</code> <hr/>	<code>\hbox_to_zero:n {\contents}</code>
<hr/> Updated: 2017-04-05 <hr/>	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of zero width and then includes this box in the current list for typesetting.
<hr/> <code>\hbox_set:Nn</code> <hr/>	<code>\hbox_set:Nn &lt;box&gt; {\contents}</code>
<code>\hbox_set:cn</code> <hr/>	Typesets the <code>&lt;contents&gt;</code> at natural width and then stores the result inside the <code>&lt;box&gt;</code> .
<code>\hbox_gset:Nn</code> <hr/>	
<code>\hbox_gset:cn</code> <hr/>	
<hr/> Updated: 2017-04-05 <hr/>	

<code>\hbox_set_to_wd:Nnn</code>	<code>\hbox_set_to_wd:Nnn &lt;box&gt; {&lt;dim expr&gt;} {&lt;contents&gt;}</code>
<code>\hbox_set_to_wd:cnn</code>	Typesets the <code>&lt;contents&gt;</code> to the width given by the <code>&lt;dim expr&gt;</code> and then stores the result inside the <code>&lt;box&gt;</code> .
<code>\hbox_gset_to_wd:Nnn</code>	
<code>\hbox_gset_to_wd:cnn</code>	
<hr/>	
Updated: 2017-04-05	

<code>\hbox_overlap_center:n</code>	<code>\hbox_overlap_center:n {&lt;contents&gt;}</code>
New: 2020-08-25	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of zero width such that material protrudes equally to both sides of the insertion point.

<code>\hbox_overlap_right:n</code>	<code>\hbox_overlap_right:n {&lt;contents&gt;}</code>
Updated: 2017-04-05	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of zero width such that material protrudes to the right of the insertion point.

<code>\hbox_overlap_left:n</code>	<code>\hbox_overlap_left:n {&lt;contents&gt;}</code>
Updated: 2017-04-05	Typesets the <code>&lt;contents&gt;</code> into a horizontal box of zero width such that material protrudes to the left of the insertion point.

<code>\hbox_set:Nw</code>	<code>\hbox_set:Nw &lt;box&gt; &lt;contents&gt; \hbox_set_end:</code>
<code>\hbox_set:cw</code>	Typesets the <code>&lt;contents&gt;</code> at natural width and then stores the result inside the <code>&lt;box&gt;</code> . In contrast to <code>\hbox_set:Nn</code> this function does not absorb the argument when finding the <code>&lt;content&gt;</code> , and so can be used in circumstances where the <code>&lt;content&gt;</code> may not be a simple argument.
<code>\hbox_set_end:</code>	
<code>\hbox_gset:Nw</code>	
<code>\hbox_gset:cw</code>	
<code>\hbox_gset_end:</code>	
Updated: 2017-04-05	

<code>\hbox_set_to_wd:Nnw</code>	<code>\hbox_set_to_wd:Nnw &lt;box&gt; {&lt;dim expr&gt;} &lt;contents&gt; \hbox_set_end:</code>
<code>\hbox_set_to_wd:cnw</code>	Typesets the <code>&lt;contents&gt;</code> to the width given by the <code>&lt;dim expr&gt;</code> and then stores the result inside the <code>&lt;box&gt;</code> . In contrast to <code>\hbox_set_to_wd:Nnn</code> this function does not absorb the argument when finding the <code>&lt;content&gt;</code> , and so can be used in circumstances where the <code>&lt;content&gt;</code> may not be a simple argument
<code>\hbox_gset_to_wd:Nnw</code>	
<code>\hbox_gset_to_wd:cnw</code>	
<hr/>	
New: 2017-06-08	

<code>\hbox_unpack:N</code>	<code>\hbox_unpack:N &lt;box&gt;</code>
<code>\hbox_unpack:c</code>	Unpacks the content of the horizontal <code>&lt;box&gt;</code> , retaining any stretching or shrinking applied when the <code>&lt;box&gt;</code> was set.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\unhcopy`.

## 35.11 Vertical mode boxes

Vertical boxes inherit their baseline from their contents. The standard case is that the baseline of the box is at the same position as that of the last item added to the box. This means that the box has no depth unless the last item added to it had depth. As a result most vertical boxes have a large height value and small or zero depth. The exception are

\_top boxes, where the reference point is that of the first item added. These tend to have a large depth and small height, although the latter is typically non-zero.

---

<code>\vbox:n</code>	<code>\vbox:n {⟨contents⟩}</code>
----------------------	-----------------------------------

---

Updated: 2017-04-05    Typesets the `⟨contents⟩` into a vertical box of natural height and includes this box in the current list for typesetting.

---

---

<code>\vbox_top:n</code>	<code>\vbox_top:n {⟨contents⟩}</code>
--------------------------	---------------------------------------

---

Updated: 2017-04-05    Typesets the `⟨contents⟩` into a vertical box of natural height and includes this box in the current list for typesetting. The baseline of the box is equal to that of the *first* item added to the box.

---

---

<code>\vbox_to_ht:nn</code>	<code>\vbox_to_ht:nn {⟨dim expr⟩} {⟨contents⟩}</code>
-----------------------------	---

---

Updated: 2017-04-05    Typesets the `⟨contents⟩` into a vertical box of height `⟨dim expr⟩` and then includes this box in the current list for typesetting.

---

---

<code>\vbox_to_zero:n</code>	<code>\vbox_to_zero:n {⟨contents⟩}</code>
------------------------------	---

---

Updated: 2017-04-05    Typesets the `⟨contents⟩` into a vertical box of zero height and then includes this box in the current list for typesetting.

---

---

<code>\vbox_set:Nn</code>	<code>\vbox_set:Nn ⟨box⟩ {⟨contents⟩}</code>
<code>\vbox_set:cn</code>	Typesets the <code>⟨contents⟩</code> at natural height and then stores the result inside the <code>⟨box⟩</code> .
<code>\vbox_gset:Nn</code>	
<code>\vbox_gset:cn</code>	

---

Updated: 2017-04-05

---

---

<code>\vbox_set_top:Nn</code>	<code>\vbox_set_top:Nn ⟨box⟩ {⟨contents⟩}</code>
<code>\vbox_set_top:cn</code>	Typesets the <code>⟨contents⟩</code> at natural height and then stores the result inside the <code>⟨box⟩</code> . The baseline of the box is equal to that of the <i>first</i> item added to the box.
<code>\vbox_gset_top:Nn</code>	
<code>\vbox_gset_top:cn</code>	

---

Updated: 2017-04-05

---

---

<code>\vbox_set_to_ht:Nnn</code>	<code>\vbox_set_to_ht:Nnn ⟨box⟩ {⟨dim expr⟩} {⟨contents⟩}</code>
<code>\vbox_set_to_ht:cnn</code>	Typesets the <code>⟨contents⟩</code> to the height given by the <code>⟨dim expr⟩</code> and then stores the result inside the <code>⟨box⟩</code> .
<code>\vbox_gset_to_ht:Nnn</code>	
<code>\vbox_gset_to_ht:cnn</code>	

---

Updated: 2017-04-05

---

---

<code>\vbox_set:Nw</code>	<code>\vbox_set:Nw ⟨box⟩ ⟨contents⟩ \vbox_set_end:</code>
<code>\vbox_set:cw</code>	Typesets the <code>⟨contents⟩</code> at natural height and then stores the result inside the <code>⟨box⟩</code> . In contrast to <code>\vbox_set:Nn</code> this function does not absorb the argument when finding the <code>⟨content⟩</code> , and so can be used in circumstances where the <code>⟨content⟩</code> may not be a simple argument.
<code>\vbox_set_end:</code>	
<code>\vbox_gset:Nw</code>	
<code>\vbox_gset:cw</code>	
<code>\vbox_gset_end:</code>	

---

Updated: 2017-04-05

---

<code>\vbox_set_to_ht:Nnw</code>	<code>\vbox_set_to_ht:Nnw &lt;box&gt; {&lt;dim expr&gt;} &lt;contents&gt; \vbox_set_end:</code>
<code>\vbox_set_to_ht:cnw</code>	Typesets the <code>&lt;contents&gt;</code> to the height given by the <code>&lt;dim expr&gt;</code> and then stores the result inside the <code>&lt;box&gt;</code> . In contrast to <code>\vbox_set_to_ht:Nnn</code> this function does not absorb the argument when finding the <code>&lt;content&gt;</code> , and so can be used in circumstances where the <code>&lt;content&gt;</code> may not be a simple argument
<code>\vbox_gset_to_ht:Nnw</code>	
<code>\vbox_gset_to_ht:cnw</code>	
<hr/>	
<code>New: 2017-06-08</code>	

<hr/> <code>\vbox_set_split_to_ht:Nnn</code>	<code>\vbox_set_split_to_ht:Nnn &lt;box<sub>1</sub>&gt; &lt;box<sub>2</sub>&gt; {&lt;dim expr&gt;}</code>
<code>\vbox_set_split_to_ht:(cNn Ncn ccn)</code>	Sets <code>&lt;box<sub>1</sub></code> to contain material to the height given by the <code>&lt;dim expr&gt;</code> by removing content from the top of <code>&lt;box<sub>2</sub></code> (which must be a vertical box).
<code>\vbox_gset_split_to_ht:Nnn</code>	
<code>\vbox_gset_split_to_ht:(cNn Ncn ccn)</code>	
<hr/>	

<hr/> <code>\vbox_unpack:N</code>	<code>\vbox_unpack:N &lt;box&gt;</code>
<code>\vbox_unpack:c</code>	Unpacks the content of the vertical <code>&lt;box&gt;</code> , retaining any stretching or shrinking applied when the <code>&lt;box&gt;</code> was set.

**TeXhackers note:** This is the TeX primitive `\unvcopy`.

## 35.12 Using boxes efficiently

The functions above for using box contents work in exactly the same way as for any other `expl3` variable. However, for efficiency reasons, it is also useful to have functions which *drop* box contents on use. When a box is dropped, the box becomes empty at the group level *where the box was originally set* rather than necessarily *at the current group level*. For example, with

```
\hbox_set:Nn \l_tmpa_box { A }
\group_begin:
  \hbox_set:Nn \l_tmpa_box { B }
  \group_begin:
    \box_use_drop:N \l_tmpa_box
  \group_end:
  \box_show:N \l_tmpa_box
\group_end:
\box_show:N \l_tmpa_box
```

the first use of `\box_show:N` will show an entirely cleared (void) box, and the second will show the letter A in the box.

These functions should be preferred when the content of the box is no longer required after use. Note that due to the unusual scoping behaviour of **drop** functions they may be applied to both local and global boxes: the latter will naturally be set and thus cleared at a global level.

<hr/> <code>\box_use_drop:N</code> <hr/>	<code>\box_use_drop:N</code> $\langle box \rangle$
<code>\box_use_drop:c</code>	Inserts the current content of the $\langle box \rangle$ onto the current list for typesetting then drops the box content. An error is raised if the variable does not exist or if it is invalid. This function may be applied to local or global boxes.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\box`.

<hr/> <code>\box_set_eq_drop:NN</code> <hr/>	<code>\box_set_eq_drop:NN</code> $\langle box_1 \rangle$ $\langle box_2 \rangle$
<code>\box_set_eq_drop:(cN Nc cc)</code>	Sets the content of $\langle box_1 \rangle$ equal to that of $\langle box_2 \rangle$ , then drops $\langle box_2 \rangle$ .
<hr/> New: 2019-01-17 <hr/>	

<hr/> <code>\box_gset_eq_drop:NN</code> <hr/>	<code>\box_gset_eq_drop:NN</code> $\langle box_1 \rangle$ $\langle box_2 \rangle$
<code>\box_gset_eq_drop:(cN Nc cc)</code>	Sets the content of $\langle box_1 \rangle$ globally equal to that of $\langle box_2 \rangle$ , then drops $\langle box_2 \rangle$ .
<hr/> New: 2019-01-17 <hr/>	

<hr/> <code>\hbox_unpack_drop:N</code> <hr/>	<code>\hbox_unpack_drop:N</code> $\langle box \rangle$
<code>\hbox_unpack_drop:c</code>	Unpacks the content of the horizontal $\langle box \rangle$ , retaining any stretching or shrinking applied when the $\langle box \rangle$ was set. The original $\langle box \rangle$ is then dropped.
<hr/> New: 2019-01-17 <hr/>	

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\unhbox`.

<hr/> <code>\vbox_unpack_drop:N</code> <hr/>	<code>\vbox_unpack_drop:N</code> $\langle box \rangle$
<code>\vbox_unpack_drop:c</code>	Unpacks the content of the vertical $\langle box \rangle$ , retaining any stretching or shrinking applied when the $\langle box \rangle$ was set. The original $\langle box \rangle$ is then dropped.
<hr/> New: 2019-01-17 <hr/>	

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\unvbox`.

## 35.13 Affine transformations

Affine transformations are changes which (informally) preserve straight lines. Simple translations are affine transformations, but are better handled in T<sub>E</sub>X by doing the translation first, then inserting an unmodified box. On the other hand, rotation and resizing of boxed material can best be handled by modifying boxes. These transformations are described here.

---

```

\box_autosize_to_wd_and_ht:Nnn \box_autosize_to_wd_and_ht:Nnn <box> {<x-size>} {<y-size>}
\box_autosize_to_wd_and_ht:cnn
\box_gautosize_to_wd_and_ht:Nnn
\box_gautosize_to_wd_and_ht:cnn

```

---

---

Resizes the  $\langle\text{box}\rangle$  to fit within the given  $\langle\text{x-size}\rangle$  (horizontally) and  $\langle\text{y-size}\rangle$  (vertically); both of the sizes are dimension expressions. The  $\langle\text{y-size}\rangle$  is the height only: it does not include any depth. The updated  $\langle\text{box}\rangle$  is an `hbox`, irrespective of the nature of the  $\langle\text{box}\rangle$  before the resizing is applied. The final size of the  $\langle\text{box}\rangle$  is the smaller of  $\{\langle\text{x-size}\rangle\}$  and  $\{\langle\text{y-size}\rangle\}$ , i.e., the result fits within the dimensions specified. Negative sizes cause the material in the  $\langle\text{box}\rangle$  to be reversed in direction, but the reference point of the  $\langle\text{box}\rangle$  is unchanged. Thus a negative  $\langle\text{y-size}\rangle$  results in the  $\langle\text{box}\rangle$  having a depth dependent on the height of the original and *vice versa*.

## 35.15 Primitive box conditionals

---

---

```
\if_hbox:N * \if_hbox:N <box>
              <true code>
\else:
              <false code>
\fi:
```

Tests if  $\langle box \rangle$  is a horizontal box.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifhbox`.

---

---

```
\if_vbox:N * \if_vbox:N <box>
              <true code>
\else:
              <false code>
\fi:
```

Tests if  $\langle box \rangle$  is a vertical box.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifvbox`.

---

---

```
\if_box_empty:N * \if_box_empty:N <box>
                   <true code>
\else:
                   <false code>
\fi:
```

Tests if  $\langle box \rangle$  is an empty (void) box.

**T<sub>E</sub>Xhackers note:** This is the T<sub>E</sub>X primitive `\ifvoid`.

## Chapter 36

# The `l3coffins` module

## Coffin code layer

In `expl3` terminology, a “coffin” is a box containing typeset material. Along with the box itself, the coffin structure includes information on the size and shape of the box, which makes it possible to align two or more coffins easily. This is achieved by providing a series of “poles” for each coffin. These are horizontal and vertical lines through the coffin at defined positions, for example the top or horizontal centre. The points where these poles intersect are called “handles”. Two coffins can then be aligned by describing the relationship between a handle on one coffin with a handle on the second. In words, an example might then read

Align the top-left handle of coffin A with the bottom-right handle of coffin B.

The locations of coffin handles are much easier to understand visually. Figure 1 shows the standard handle positions for a coffin typeset in horizontal mode (left) and in vertical mode (right). Notice that the later case results in a greater number of handles being available. As illustrated, each handle results from the intersection of two poles. For example, the centre of the coffin is marked `(hc,vc)`, i.e., it is the point of intersection of the horizontal centre pole with the vertical centre pole. New handles are generated automatically when poles are added to a coffin: handles are “dynamic” entities.

### 36.1 Controlling coffin poles

A number of standard poles are automatically generated when the coffin is set or an alignment takes place. The standard poles for all coffins are:

Figure 1: Standard coffin handles: left, horizontal coffin; right, vertical coffin

- l a pole running along the left-hand edge of the bounding box of the coffin;
- hc a pole running vertically through the centre of the coffin half-way between the left- and right-hand edges of the bounding box (i.e., the “horizontal centre”);
- r a pole running along the right-hand edge of the bounding box of the coffin;
- b a pole running along the bottom edge of the bounding box of the coffin;
- vc a pole running horizontally through the centre of the coffin half-way between the bottom and top edges of the bounding box (i.e., the “vertical centre”);
- t a pole running along the top edge of the bounding box of the coffin;
- H a pole running along the baseline of the typeset material contained in the coffin.

In addition, coffins containing vertical-mode material also feature poles which reflect the richer nature of these systems:

- B a pole running along the baseline of the material at the bottom of the coffin.
- T a pole running along the baseline of the material at the top of the coffin.

## 36.2 Creating and initialising coffins

---

<code>\coffin_new:N</code> <code>\coffin_new:c</code> <hr/> <small>New: 2011-08-17</small>	<code>\coffin_new:N</code> $\langle coffin \rangle$ Creates a new $\langle coffin \rangle$ or raises an error if the name is already taken. Updated: 2019-01-21

---

Sets the  $\langle pole \rangle$  to run horizontally through the  $\langle coffin \rangle$ . The  $\langle pole \rangle$  is placed at the  $\langle offset \rangle$  from the baseline of the  $\langle coffin \rangle$ . The  $\langle offset \rangle$  should be given as a dimension expression.

---

<code>\coffin_set_vertical_pole:Nnn</code>	<code>\coffin_set_vertical_pole:Nnn &lt;coffin&gt; {&lt;pole&gt;} {&lt;offset&gt;}</code>
<code>\coffin_set_vertical_pole:cnn</code>	
<code>\coffin_gset_vertical_pole:Nnn</code>	
<code>\coffin_gset_vertical_pole:cnn</code>	

---

New: 2012-07-20  
Updated: 2019-01-21

---

Sets the `<pole>` to run vertically through the `<coffin>`. The `<pole>` is placed at the `<offset>` from the left-hand edge of the bounding box of the `<coffin>`. The `<offset>` should be given as a dimension expression.

---

<code>\coffin_reset_poles:N</code>	<code>\coffin_reset_poles:N &lt;coffin&gt;</code>
<code>\coffin_greset_poles:N</code>	

---

New: 2023-05-17

---

Resets the poles of the `<coffin>` to the standard set, removing any custom or inherited poles. The poles will therefore be equal to those that would be obtained from `\hcoffin_set:Nn` or similar; the bounding box of the coffin is not reset, so any material outside of the formal bounding box will not influence the poles.

## 36.4 Coffin affine transformations

---

<code>\coffin_resize:Nnn</code>	<code>\coffin_resize:Nnn &lt;coffin&gt; {&lt;width&gt;} {&lt;total-height&gt;}</code>
<code>\coffin_resize:cnn</code>	
<code>\coffin_gresize:Nnn</code>	
<code>\coffin_gresize:cnn</code>	

---

Updated: 2019-01-23

---

Resizes the `<coffin>` to `<width>` and `<total-height>`, both of which should be given as dimension expressions.

---

<code>\coffin_rotate:Nn</code>	<code>\coffin_rotate:Nn &lt;coffin&gt; {&lt;angle&gt;}</code>
<code>\coffin_rotate:cn</code>	
<code>\coffin_grotate:Nn</code>	
<code>\coffin_grotate:cn</code>	

---

Rotates the `<coffin>` by the given `<angle>` (given in degrees counter-clockwise). This process rotates both the coffin content and poles. Multiple rotations do not result in the bounding box of the coffin growing unnecessarily.

---

<code>\coffin_scale:Nnn</code>	<code>\coffin_scale:Nnn &lt;coffin&gt; {&lt;x-scale&gt;} {&lt;y-scale&gt;}</code>
<code>\coffin_scale:cnn</code>	
<code>\coffin_gscale:Nnn</code>	
<code>\coffin_gscale:cnn</code>	

---

Updated: 2019-01-23

---

Scales the `<coffin>` by a factors `<x-scale>` and `<y-scale>` in the horizontal and vertical directions, respectively. The two scale factors should be given as real numbers.

## 36.5 Joining and using coffins

---

<code>\coffin_attach:NnnNnnnn</code>	<code>\coffin_attach:NnnNnnnn</code>
<code>\coffin_attach:(cnnNnnnn Nnnncnnnn cnnncnnnn)</code>	<code>&lt;coffin<sub>1</sub>&gt; {&lt;coffin<sub>1</sub>-pole<sub>1</sub>&gt;} {&lt;coffin<sub>1</sub>-pole<sub>2</sub>&gt;}</code>
<code>\coffin_gattach:NnnNnnnn</code>	<code>&lt;coffin<sub>2</sub>&gt; {&lt;coffin<sub>2</sub>-pole<sub>1</sub>&gt;} {&lt;coffin<sub>2</sub>-pole<sub>2</sub>&gt;}</code>
<code>\coffin_gattach:(cnnNnnnn Nnnncnnnn cnnncnnnn)</code>	<code>{&lt;x-offset&gt;} {&lt;y-offset&gt;}</code>

---

Updated: 2019-01-22

This function attaches `<coffin2>` to `<coffin1>` such that the bounding box of `<coffin1>` is not altered, i.e., `<coffin2>` can protrude outside of the bounding box of the coffin. The alignment is carried out by first calculating `<handle1>`, the point of intersection of `<coffin1-pole1>` and `<coffin1-pole2>`, and `<handle2>`, the point of intersection of `<coffin2-pole1>` and `<coffin2-pole2>`. `<coffin2>` is then attached to `<coffin1>` such that the relationship between `<handle1>` and `<handle2>` is described by the `<x-offset>` and `<y-offset>`. The two offsets should be given as dimension expressions.

---

<code>\coffin_join:NnnNnnnn</code>	<code>\coffin_join:NnnNnnnn</code>
<code>\coffin_join:(cnnNnnnn Nnnncnnnn cnnncnnnn)</code>	<code>&lt;coffin<sub>1</sub>&gt; {&lt;coffin<sub>1</sub>-pole<sub>1</sub>&gt;} {&lt;coffin<sub>1</sub>-pole<sub>2</sub>&gt;}</code>
<code>\coffin_gjoin:NnnNnnnn</code>	<code>&lt;coffin<sub>2</sub>&gt; {&lt;coffin<sub>2</sub>-pole<sub>1</sub>&gt;} {&lt;coffin<sub>2</sub>-pole<sub>2</sub>&gt;}</code>
<code>\coffin_gjoin:(cnnNnnnn Nnnncnnnn cnnncnnnn)</code>	<code>{&lt;x-offset&gt;} {&lt;y-offset&gt;}</code>

---

Updated: 2019-01-22

This function joins `<coffin2>` to `<coffin1>` such that the bounding box of `<coffin1>` may expand. The new bounding box covers the area containing the bounding boxes of the two original coffins. The alignment is carried out by first calculating `<handle1>`, the point of intersection of `<coffin1-pole1>` and `<coffin1-pole2>`, and `<handle2>`, the point of intersection of `<coffin2-pole1>` and `<coffin2-pole2>`. `<coffin2>` is then attached to `<coffin1>` such that the relationship between `<handle1>` and `<handle2>` is described by the `<x-offset>` and `<y-offset>`. The two offsets should be given as dimension expressions.

---

<code>\coffin_typeset:Nnnnn</code>	<code>\coffin_typeset:Nnnnn &lt;coffin&gt; {&lt;pole<sub>1</sub>&gt;} {&lt;pole<sub>2</sub>&gt;}</code>
<code>\coffin_typeset:cnnnn</code>	<code>{&lt;x-offset&gt;} {&lt;y-offset&gt;}</code>

---

Updated: 2012-07-20

Typesetting is carried out by first calculating `<handle>`, the point of intersection of `<pole1>` and `<pole2>`. The coffin is then typeset in horizontal mode such that the relationship between the current reference point in the document and the `<handle>` is described by the `<x-offset>` and `<y-offset>`. The two offsets should be given as dimension expressions. Typesetting a coffin is therefore analogous to carrying out an alignment where the “parent” coffin is the current insertion point.

## 36.6 Measuring coffins

---

<code>\coffin_dp:N</code>	<code>\coffin_dp:N &lt;coffin&gt;</code>
<code>\coffin_dp:c</code>	Calculates the depth (below the baseline) of the <code>&lt;coffin&gt;</code> in a form suitable for use in a <code>&lt;dim expr&gt;</code> .

---

---

<code>\coffin_ht:N</code>	<code>\coffin_ht:N</code> $\langle coffin \rangle$
<code>\coffin_ht:c</code>	Calculates the height (above the baseline) of the $\langle coffin \rangle$ in a form suitable for use in a $\langle dim\ expr \rangle$ .

---

<code>\coffin_ht_plus_dp:N</code>	<code>\coffin_ht_plus_dp:N</code> $\langle coffin \rangle$
<code>\coffin_ht_plus_dp:c</code>	Calculates the total vertical size (height plus depth) of the $\langle coffin \rangle$ in a form suitable for use in a $\langle dim\ expr \rangle$ .

---

New: 2024-10-01

---

---

<code>\coffin_wd:N</code>	<code>\coffin_wd:N</code> $\langle coffin \rangle$
<code>\coffin_wd:c</code>	Calculates the width of the $\langle coffin \rangle$ in a form suitable for use in a $\langle dim\ expr \rangle$ .

---

## 36.7 Coffin diagnostics

---

<code>\coffin_display_handles:Nn</code>	<code>\coffin_display_handles:Nn</code> $\langle coffin \rangle$ $\{\langle color \rangle\}$
<code>\coffin_display_handles:cn</code>	This function first calculates the intersections between all of the $\langle poles \rangle$ of the $\langle coffin \rangle$ to give a set of $\langle handles \rangle$ . It then prints the $\langle coffin \rangle$ at the current location in the source, with the position of the $\langle handles \rangle$ marked on the coffin. The $\langle handles \rangle$ are labelled as part of this process: the locations of the $\langle handles \rangle$ and the labels are both printed in the $\langle color \rangle$ specified.

---

Updated: 2011-09-02

---

---

<code>\coffin_mark_handle:Nnnn</code>	<code>\coffin_mark_handle:Nnnn</code> $\langle coffin \rangle$ $\{\langle pole_1 \rangle\}$ $\{\langle pole_2 \rangle\}$ $\{\langle color \rangle\}$
<code>\coffin_mark_handle:cnnn</code>	This function first calculates the $\langle handle \rangle$ for the $\langle coffin \rangle$ as defined by the intersection of $\langle pole_1 \rangle$ and $\langle pole_2 \rangle$ . It then marks the position of the $\langle handle \rangle$ on the $\langle coffin \rangle$ . The $\langle handle \rangle$ are labelled as part of this process: the location of the $\langle handle \rangle$ and the label are both printed in the $\langle color \rangle$ specified.

---

Updated: 2011-09-02

---

---

<code>\coffin_show_structure:N</code>	<code>\coffin_show_structure:N</code> $\langle coffin \rangle$
<code>\coffin_show_structure:c</code>	This function shows the structural information about the $\langle coffin \rangle$ in the terminal. The width, height and depth of the typeset material are given, along with the location of all of the poles of the coffin.

---

Updated: 2015-08-01

---

Notice that the poles of a coffin are defined by four values: the  $x$  and  $y$  coordinates of a point that the pole passes through and the  $x$ - and  $y$ -components of a vector denoting the direction of the pole. It is the ratio between the later, rather than the absolute values, which determines the direction of the pole.

---

<code>\coffin_log_structure:N</code>	<code>\coffin_log_structure:N</code> $\langle coffin \rangle$
<code>\coffin_log_structure:c</code>	This function writes the structural information about the $\langle coffin \rangle$ in the log file. See also <code>\coffin_show_structure:N</code> which displays the result in the terminal.

---

New: 2014-08-22  
Updated: 2015-08-01

---

---

<code>\coffin_show:N</code>	<code>\coffin_show:N</code> $\langle coffin \rangle$
<code>\coffin_show:c</code>	<code>\coffin_log:N</code> $\langle coffin \rangle$
<code>\coffin_log:N</code>	Shows full details of poles and contents of the $\langle coffin \rangle$ in the terminal or log file. See <code>\coffin_show_structure:N</code> and <code>\box_show:N</code> to show separately the pole structure and the contents.
<code>\coffin_log:c</code>	

---

New: 2021-05-11

---

<hr/> <code>\coffin_show:Nnn</code>	<code>\coffin_show:Nnn &lt;coffin&gt; {(int expr<sub>1</sub>)} {(int expr<sub>2</sub>)}</code>
<code>\coffin_show:cnn</code>	<code>\coffin_log:Nnn &lt;coffin&gt; {(int expr<sub>1</sub>)} {(int expr<sub>2</sub>)}</code>
<code>\coffin_log:Nnn</code>	Shows poles and contents of the <code>&lt;coffin&gt;</code> in the terminal or log file, showing the first <code>&lt;int expr<sub>1</sub>&gt;</code> items in the coffin, and descending into <code>&lt;int expr<sub>2</sub>&gt;</code> group levels. See <code>\coffin_show_structure:N</code> and <code>\box_show:Nnn</code> to show separately the pole structure and the contents.
<code>\coffin_log:cnn</code>	
<hr/> New: 2021-05-11 <hr/>	

## 36.8 Constants and variables

<hr/> <code>\c_empty_coffin</code> <hr/>	A permanently empty coffin.
--	-----------------------------

<hr/> <code>\l_tmpa_coffin</code>	Scratch coffins for local assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\l_tmpb_coffin</code>	
<hr/> New: 2012-06-19 <hr/>	

<hr/> <code>\g_tmpa_coffin</code>	Scratch coffins for global assignment. These are never used by the kernel code, and so are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.
<code>\g_tmpb_coffin</code>	
<hr/> New: 2019-01-24 <hr/>	

## Chapter 37

# The l3color module

## Color support

### 37.1 Color in boxes

Controlling the color of text in boxes requires a small number of control functions, so that the boxed material uses the color at the point where it is set, rather than where it is used.

---

<code>\color_group_begin:</code>	<code>\color_group_begin:</code>
<code>\color_group_end:</code>	<code>...</code>
<code>New: 2011-09-03</code>	<code>\color_group_end:</code>

---

Creates a color group: one used to “trap” color settings. This grouping is built in to for example `\hbox_set:Nn`.

---

<code>\color_ensure_current:</code>	<code>\color_ensure_current:</code>
-------------------------------------	-------------------------------------

---

`New: 2011-09-03` Ensures that material inside a box uses the foreground color at the point where the box is set, rather than that in force when the box is used. This function should usually be used within a `\color_group_begin: ... \color_group_end: group`.

### 37.2 Color models

A color *model* is a way to represent sets of colors. Different models are particularly suitable for different output methods, *e.g.* screen or print. Parameter-based models can describe a very large number of unique colors, and have a varying number of *axes* which define a color space. In contrast, various proprietary models are available which define *spot* colors (more formally separations).

Core models are used to pass color information to output; these are “native” to l3color. Core models use real numbers in the range  $[0, 1]$  to represent values. The core models supported here are

- **gray** Grayscale color, with a single axis running from 0 (fully black) to 1 (fully white)
- **rgb** Red-green-blue color, with three axes, one for each of the components

- **cmyk** Cyan-magenta-yellow-black color, with four axes, one for each of the components

There are also interface models: these are convenient for users but have to be manipulated before storing/passing to the backend. Interface models are primarily integer-based: see below for more detail. The supported interface models are

- **Gray** Grayscale color, with a single axis running from 0 (fully black) to 15 (fully white)
- **hsb** Hue-saturation-brightness color, with three axes, all real values in the range  $[0, 1]$  for hue saturation and brightness
- **Hsb** Hue-saturation-brightness color, with three axes, integer in the range  $[0, 360]$  for hue, real values in the range  $[0, 1]$  for saturation and brightness
- **HSB** Hue-saturation-brightness color, with three axes, integers in the range  $[0, 240]$  for hue, saturation and brightness
- **HTML** HTML format representation of RGB color given as a single six-digit hexadecimal number
- **RGB** Red-green-blue color, with three axes, one for each of the components, values as integers from 0 to 255
- **oklch** Lightness-chromacity-hue color in the Oklab color space (<https://bottosson.github.io/posts/oklab>), which models human perception, with three axes, real values in the range  $[0, 1]$  for lightness, real values in the range  $[0, 0.4]$  for chromacity and real values in the range  $[0, 360]$  for hue.
- **oklab** Oklab color, with three axes, real values in the range  $[0, 1]$  for lightness and real values in the range  $[-0.4, 0.4]$  for the position on the green/red- and yellow/blue-axes.
- **wave** Light wavelength, a real number in the range 380 to 780 (nanometres)

All interface models are internally stored as **rgb**.

Finally, there are a small number of models which are parsed to allow data transfer from **xcolor** but which should not be used by end-users. These are

- **cmy** Cyan-magenta-yellow color with three axes, one for each of the components; converted to **cmyk**
- **tHsb** “Tuned” hue-saturation-brightness color with three axes, integer in the range  $[0, 360]$  for hue, real values in the range  $[0, 1]$  for saturation and brightness; converted to **rgb** using the standard tuning map defined by **xcolor**
- **&spot** Spot color tint with one value; treated as a gray tint as spot color data is not available for extraction

To allow parsing of data from **xcolor**, any leading model up the first `:` will be discarded; the approach of selecting an internal form for data is *not* used in **l3color**.

Additional models may be created to allow mixing of separation colors with each other or with those from other models. See Section 37.9 for more detail of color support for additional models.

When color is selected by model, the `<value(s)>` given are specified as a comma-separated list. The length of the list will therefore be determined by the detail of the model involved.

Color models (and interconversion) are complex, and more details are given in the manual to the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> `xcolor` package and in the *PostScript Language Reference Manual*, published by Addison–Wesley.

### 37.3 Color expressions

In addition to allowing specification of color by model and values, `l3color` also supports color expressions. These are created by combining one or more color names, with the amount of each specified as a value in the range 0–100. The value should be given between `!` symbols in the expression. Thus for example

```
red!50!green
```

is a mixture of 50 % red and 50 % green. A trailing value is interpreted as implicitly followed by `!white`, and so

```
red!25
```

specifies 25 % red mixed with 75 % white.

Where the models for the mixed colors are different, the model of the first color is used. Thus

```
red!50!cyan
```

will result in a color specification using the `rgb` model, made up of 50 % red and 50 % of cyan *expressed in `rgb`*. This may be important as color model interconversion is not exact.

The one exception to the above is where the first model in an expression is `gray`. In this case, the order of mixing is “swapped” internally, so that for example

```
black!50!red
```

has the same result as

```
red!50!black
```

(the predefined colors `black` and `white` use the `gray` model).

Where more than two colors are mixed in an expression, evaluation takes place in a stepwise fashion. Thus in

```
cyan!50!magenta!10!yellow
```

the sub-expression

```
cyan!50!magenta
```

is first evaluated to give an intermediate color specification, before the second step

```
<intermediate>!10!yellow
```

where `<intermediate>` represents this transitory calculated value.

Within a color expression, `.` may be used to represent the color active for typesetting (the current color). This allows for example

.!50

to mean a mixture of 50 % of current color with white.

(Color expressions supported here are a subset of those provided by the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> xcolor package. At present, only such features as are clearly useful have been added here.)

## 37.4 Named colors

Color names are stored in a single namespace, which makes them accessible as part of color expressions. Whilst they are not reserved in a technical sense, the names **black**, **white**, **red**, **green**, **blue**, **cyan**, **magenta** and **yellow** have special meaning and should not be redefined. Color names should be made up of letters, numbers and spaces only: other characters are reserved for use in color expressions. In particular, **.** represents the current color at the start of a color expression.

---

<code>\color_set:nn</code>	<code>\color_set:nn {&lt;name&gt;} {&lt;color expression&gt;}</code>
----------------------------	--

---

Evaluates the `<color expression>` and stores the resulting color specification as the `<name>`.

---

<code>\color_set:nnn</code>	<code>\color_set:nnn {&lt;name&gt;} {&lt;model(s)&gt;} {&lt;value(s)&gt;}</code>
-----------------------------	--

---

Updated: 2024-12-24 Stores the color specification equivalent to the `<model(s)>` and `<value(s)>` as the `<name>`. The `<value(s)>` are expanded before parsing.

---

<code>\color_set_eq:nn</code>	<code>\color_set_eq:nn {&lt;name<sub>1</sub>&gt;} {&lt;name<sub>2</sub>&gt;}</code>
-------------------------------	---

---

Copies the color specification in `<name2>` to `<name1>`. The special name **.** may be used to represent the current color, allowing it to be saved to a name.

---

<code>\color_if_exist:p:n</code>	<code>\color_if_exist:p:n {&lt;name&gt;}</code>
<code>\color_if_exist:nTF</code>	<code>\color_if_exist:nTF {&lt;name&gt;} {&lt;&gt;true code&gt;} {&lt;&gt;false code&gt;}</code>

---

New: 2022-08-12 Tests whether `<name>` is currently defined to provide a color specification.

---

<code>\color_show:n</code>	<code>\color_show:n {&lt;name&gt;}</code>
<code>\color_log:n</code>	<code>\color_log:n {&lt;name&gt;}</code>

---

New: 2021-05-11 Displays the color specification stored in the `<name>` on the terminal or log file.

## 37.5 Selecting colors

General selection of color is safe when split across pages: a stack is used to ensure that the correct color is re-selected on the new page.

These commands set the current color (**.**): other more specialised functions such as fill and stroke selectors do *not* adjust this value.

---

<code>\color_select:n</code>	<code>\color_select:n {&lt;color expression&gt;}</code>
------------------------------	---

---

`\color_select:V` Parses the `<color expression>` and then activates the resulting color specification for typeset material.

---

<hr/> <code>\color_select:nn</code>	<code>\color_select:nn {\langle model(s) \rangle} {\langle value(s) \rangle}</code>
<hr/> <code>\color_select:(nV Vn VV)</code>	Activates the color specification equivalent to the $\langle model(s) \rangle$ and $\langle value(s) \rangle$ for typeset material. The $\langle value(s) \rangle$ are fully expanded before parsing.
<hr/> <hr/> <code>\l_color_fixed_model_tl</code>	When this is set to a non-empty value, colors will be converted to the specified model when they are selected. Note that included images and similar are not influenced by this setting.

## 37.6 Colors for fills and strokes

Colors for drawing operations and so forth are split into strokes and fills (the latter may also be referred to as non-stroke color). The fill color is used for text under normal circumstances. Depending on the backend, stroke color may use a *stack*, in which case it exhibits the same page breaking behavior as general color. However, `dvips/dvisvgm` do not support this, and so color will need to be contained within a scope, such as `\draw_begin:/\draw_end:.`

<hr/> <code>\color_fill:n</code>	<code>\color_fill:n {\langle color expression \rangle}</code>
<hr/> <code>\color_stroke:n</code>	Parses the $\langle color expression \rangle$ and then activates the resulting color specification for filling or stroking.
<hr/> <code>\color_fill:nn</code>	<code>\color_fill:nn {\langle model(s) \rangle} {\langle value(s) \rangle}</code>
<hr/> <code>\color_stroke:nn</code>	Activates the color specification equivalent to the $\langle model(s) \rangle$ and $\langle value(s) \rangle$ for filling or stroking. The $\langle value(s) \rangle$ are fully expanded before parsing.
<hr/> <code>Updated: 2024-12-24</code>	
<hr/> <code>color.sc</code>	When using <code>dvips</code> , this PostScript variable holds the stroke color.

### 37.6.1 Coloring math mode material

Coloring math mode material using `\color_select:nn(n)` has some restrictions and often leads to spacing issues and/or poor input syntax. Avoiding generating `\mathord` atoms whilst coloring only those parts of the input which are required needs careful handling. The functionality here covers this important use case.

<hr/> <code>\color_math:nn</code>	<code>\color_math:nn {\langle color expression \rangle} {\langle content \rangle}</code>
<hr/> <code>\color_math:nnn</code>	<code>\color_math:nnn {\langle model(s) \rangle} {\langle value(s) \rangle} {\langle content \rangle}</code>
<hr/> <code>New: 2022-01-26</code>	Works as for <code>\color_select:n(n)</code> but applies color only to the math mode $\langle content \rangle$ .
<hr/> <code>Updated: 2024-12-24</code>	The $\langle value(s) \rangle$ are fully expanded before parsing. The function does not generate a group and the $\langle content \rangle$ therefore retains its math atom states. Sub/superscripts are also properly handled.

<hr/> <code>\l_color_math_active_tl</code>	This list controls which tokens are considered as math active and should therefore be replaced by their definition during searching for sub/superscripts.
<hr/> <code>New: 2022-01-26</code>	

## 37.7 Multiple color models

When selecting or setting a color with an explicit model, it is possible to give values for more than one model at one time. This is particularly useful where automated conversion between models does not give the desired outcome. To do this, the list of models and list of values are both subdivided using / characters (as for the similar function in `xcolor`). For example, to save a color with explicit `cmyk` and `rgb` values, one could use

```
\color_set:nnn { foo } { cmyk / rgb }
{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1, 0.2 , 0.3 }
```

The manually-specified conversion will be used in preference to automated calculation whenever the model(s) listed are used: both in expressions and when a fixed model is active.

Similarly, the same syntax can be applied to directly selecting a color.

```
\color_select:nn { cmyk / rgb }
{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1, 0.2 , 0.3 }
```

Again, this list is used when a fixed model is active: the first entry is used unless there is a fixed model matching one of the other entries.

## 37.8 Exporting color specifications

The major use of color expressions is in setting typesetting output, but there are other places in which some form of color information is required. These may need data in a different format or using a different model to the internal representation. Thus a set of functions are available to export colors in different formats.

Valid export targets are

- **backend** Two brace groups: the first containing the model, the second containing space-separated values appropriate for the model; this is the format required by backend functions of `expl3`
- **comma-sep-cmyk** Comma-separated cyan-magenta-yellow-black values
- **comma-sep-rgb** Comma-separated red-green-blue values suitable for use as a PDF annotation color
- **HTML** Uppercase two-digit hexadecimal values, expressing a red-green-blue color; the digits are *not* separated
- **space-sep-cmyk** Space-separated cyan-magenta-yellow-black values
- **space-sep-rgb** Space-separated red-green-blue values suitable for use as a PDF annotation color

---

```
\color_export:nnN \color_export:nnN {<color expression>} {<format>} <tl var>
```

Parses the `<color expression>` as described earlier, then converts to the `<format>` specified and assigns the data to the `<tl var>`.

<hr/> <code>\color_export:nnnN</code> <hr/>	<code>\color_export:nnnN</code> $\{\langle model \rangle\}$ $\{\langle value(s) \rangle\}$ $\{\langle format \rangle\}$ $\langle tl\ var \rangle$
Updated: 2024-12-24	Expresses the combination of $\langle model \rangle$ and $\langle value(s) \rangle$ in an internal representation, then converts to the $\langle format \rangle$ specified and assigns the data to the $\langle tl\ var \rangle$ . The $\langle value(s) \rangle$ are fully expanded before parsing.

## 37.9 Creating new color models

Additional color models are required to support specialist workflows, for example those involving separations (see <https://helpx.adobe.com/indesign/using/spot-process-colors.html> for details of the use of separations in print). Color models may be split into families; for the standard device-based color models (`DeviceCMYK`, `DeviceRGB`, `DeviceGray`), these are synonymous. This is not generally the case: see the PDF reference for more details. (Note that `l3color` uses the shorter names `cmYk`, etc.)

<hr/> <code>\color_model_new:nnn</code> <hr/>	<code>\color_model_new:nnn</code> $\{\langle model \rangle\}$ $\{\langle family \rangle\}$ $\{\langle params \rangle\}$
	Creates a new $\langle model \rangle$ which is derived from the color model $\langle family \rangle$ . The latter should be one of

- `DeviceN`
- `ICCBased`
- `Separation`

(The  $\langle family \rangle$  may be given in mixed case as-in the PDF reference: internally, case of these strings is folded.) Depending on the  $\langle family \rangle$ , one or more  $\langle params \rangle$  are mandatory or optional.

For a `Separation` space, there are three *compulsory* keys.

- **name** The name of the Separation, for example the formal name of a spot color ink. Such a  $\langle name \rangle$  may contain spaces, etc., which are not permitted in the  $\langle model \rangle$ .
- **alternative-model** An alternative device colorspace, one of `cmYk`, `rgb`, `gray` or `CIELAB`. The three parameter-based models work as described above; see below for details of `CIELAB` colors.
- **alternative-values** A comma-separated list of values appropriate to the **alternative-model**. This information is used by the PDF application if the **Separation** is not available.

`CIELAB` color separations are created using the **alternative-model** = `CIELAB` setting. These colors must also have an **illuminant** key, one of `a`, `c`, `e`, `d50`, `d55`, `d65` or `d75`. The **alternative-values** in this case are the three parameters  $L^*$ ,  $a^*$  and  $b^*$  of the `CIELAB` model. Full details of this device-independent color approach are given in the documentation to the `colorspace` package.

`CIELAB` colors *cannot* be converted into other device-dependent color spaces, and as such, mixing can only occur if colors set up using the `CIELAB` model are also given with an alternative parameter-based model. If that is not the case, `l3color` will fallback to using black as the colorant in any mixing.

For a `DeviceN` space, there is one *compulsory* key.

- **names** The names of the components of the **DeviceN** space. Each should be either the **<name>** of a **Separation** model, a process color name (**cyan**, etc.) or the special name **none**.

For a **ICCBased** space, there is one *compulsory* key.

- **file** The name of the file containing the profile.

### 37.9.1 Color profiles

Color profiles are used to ensure color accuracy by linking to collaboration. Applying a profile can be used to standardise color which is otherwise device-dependent.

---

<b>\color_profile_apply:nn</b>	<b>\color_profile_apply:nn</b> {<profile>} {<model>}
--------------------------------	--

---

New: 2021-02-23

This function applies a **<profile>** to one of the device **<models>**. The profile will then apply to all color of the selected **<model>**. The **<profile>** should specify an ICC profile file. The **<model>** has to be one the standard device models: **cmym**, **gray** or **rgb**.

## Chapter 38

# The l3graphics module

## Graphics inclusion support

### 38.1 Graphics keys

Inclusion of graphic files requires a range of low-level data be passed to the backend. This is set up using a small number of key–value settings, which are stored in the **graphics** tree.

---

**decodearray** Array to decode color in bitmap graphic: when non-empty, this should be in the form of one, two or three pairs of real numbers in the range  $[0, 1]$ , separated by spaces.

---

**draft** Switch to enable draft mode: graphics are read but not included when this is true.

---

**interpolate** Switch which indicates whether interpolation should be applied to bitmap graphic files.

---

**page** The page to extract from a multi-page graphic file: used for **.pdf** files which may contain multiple pages.

---

**pdf-attr** Additional PDF-focussed attributes: available to allow control of extended **.pdf** structures beyond those needed for graphic inclusion. Due to backend restrictions, this key is only functional with direct PDF mode (pdfTeX and LuaTeX).

---

**pagebox** The nature of the page box setting used to determine the bounding box of material: used for **.pdf** files which feature multiple page box specifications. A choice from **art**, **bleed**, **crop**, **media**, **trim**. The standard setting is **crop**.

---

**type** The type of graphic file being included: if this key is not set, the *type* is determined from the file extension.

## 38.2 Including graphics

<code>\graphics_include:nn</code>	<code>\graphics_include:nn {&lt;keys&gt;} {&lt;file&gt;}</code>
<code>\graphics_include:nV</code>	Horizontal-mode command which includes the <code>&lt;file&gt;</code> as a graphic at the current location. The file <code>&lt;type&gt;</code> may be given as one of the <code>&lt;keys&gt;</code> , or will otherwise be determined from file extension. The <code>&lt;keys&gt;</code> is used to pass settings as detailed above.
New: 2025-03-14	

<code>\l_graphics_ext_type_prop</code>	Defines mapping between file extensions and file types; where there is no entry for an extension, the type is assumed to be the extension with the leading <code>.</code> removed. Entries should be made in lower case, and the key should be an extension including the leading <code>.</code> , for example
New: 2025-03-14	

```
\prop_put:Nnn \l_graphics_ext_type_prop { .ps } { eps }
```

<code>\l_graphics_search_ext_seq</code>	Extensions to use for graphic searching when the given <code>&lt;file&gt;</code> name is not found by <code>\graphics_get_full_name:nn</code> .
New: 2025-03-14	

<code>\l_graphics_search_path_seq</code>
New: 2025-03-14

Each entry is the path to a directory which should be searched when seeking a graphic file. Each path can be relative or absolute, and should not include the trailing slash. The entries are not expanded when used so may contain active characters but should not feature any variable content. Spaces need not be quoted.

## 38.3 Utility functions

<code>\graphics_get_full_name:nN</code>	<code>\graphics_get_full_name:nN {&lt;file&gt;} &lt;tl var&gt;</code>
<code>\graphics_get_full_name:nNTF</code>	<code>\graphics_get_full_name:nNTF {&lt;file&gt;} &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
New: 2025-03-14	

Searches for `<file>` first as given and then using the extensions listed in `\l_graphics_search_ext_seq`. The search path used will be the entries of `\l_graphics_search_path_seq`. If found, the full file name including any path and extension will be returned in the `<tl var>`. In the non-branching version, the `<tl var>` will be set to `\q_no_value` in the case that the graphics is not found.

<code>\graphics_get_pagecount:nN</code>	<code>\graphics_get_pagecount:nn {&lt;file&gt;} &lt;tl var&gt;</code>
New: 2025-03-14	Reads the graphics <code>&lt;file&gt;</code> and extracts the number of pages, which are stored in the <code>&lt;tl var&gt;</code> .

## 38.4 Showing and logging included graphics

---

<code>\graphics_show_list:</code>	<code>\graphics_show_list:</code>
<code>\graphics_log_list:</code>	<code>\graphics_log_list:</code>

---

New: 2025-03-14

These functions list all graphic files loaded in a similar manner to `\file_show_list:` and `\file_log_list:`. While `\graphics_show_list:` displays the list in the terminal, `\graphics_log_list:` outputs it to the log file only. In both cases, only graphics loaded by `!3graphics` are listed.

## Chapter 39

# The `\opacity` module Opacity (transparency) support

### 39.1 Selecting opacity

Opacity (transparency) shares many characteristics with color. However, limitations in terms of backends mean that it is not always possible to use a dedicated stack for tracking opacity. The best results when breaking pages are therefore likely to result using direct PDF output (pdfTeX, LuaTeX).

For users of PostScript-based routes, note that there are security restrictions which can prevent opacity being available in output. In particular, using Adobe Distiller, you will need to enable transparency in the (text-based) configuration: this is not selectable from the GUI.

For users of PDF-based routes, note that opacity only takes effect if a `\DocumentMetadata{}` is added *before* `\documentclass`, which loads and activates the PDF management. See `pdfmanagement-testphase.pdf` for more info.

<hr/> <code>\opacity_select:n</code> <hr/>	<code>\opacity_select:n {&lt;expression&gt;}</code>
<code>New: 2025-03-27</code>	Evaluates the <code>&lt;expression&gt;</code> , which should yield a value in the range $[0, 1]$ . This is then activated as an opacity for both filling and stroking.
<hr/> <code>\opacity_fill:n</code> <hr/>	<code>\opacity_fill:n {&lt;expression&gt;}</code>
<code>\opacity_stroke:n</code> <hr/>	Evaluates the <code>&lt;expression&gt;</code> , which should yield a value in the range $[0, 1]$ . This is then activated as an opacity for filling or stroking, respectively.
<code>New: 2025-03-27</code>	

# Chapter 40

## The l3pdf module Core PDF support

### 40.1 Objects

#### 40.1.1 Named objects

An  $\langle object \rangle$  name should fully expand to tokens suitable for use in a label-like context.

---

<code>\pdf_object_new:n</code>	<code>\pdf_object_new:n {<math>\langle object \rangle</math>}</code>
--------------------------------	--

---

<small>New: 2022-08-23</small>	Declares $\langle object \rangle$ as a PDF object. The object may be referenced from this point on, and written later using <code>\pdf_object_write:nnn</code> .
--------------------------------	--

---

---

<code>\pdf_object_write:nnn</code>	<code>\pdf_object_write:nnn {<math>\langle object \rangle</math>} {<math>\langle type \rangle</math>} {<math>\langle content \rangle</math>}</code>
------------------------------------	---

---

<code>\pdf_object_write:nne</code>	Writes the $\langle content \rangle$ as content of the $\langle object \rangle$ . Depending on the $\langle type \rangle$ declared for the object, the format required for $\langle content \rangle$ will vary:
------------------------------------	---

---

New: 2022-08-23

`array` A space-separated list of values

`dict` Key-value pairs in the form `/ $\langle key \rangle$   $\langle value \rangle$`

`fstream` Two brace groups:  $\langle file name \rangle$  and  $\langle file content \rangle$

`stream` Two brace groups:  $\langle attributes dictionary \rangle$  and  $\langle stream contents \rangle$

---

<code>\pdf_object_ref:n *</code>	<code>\pdf_object_ref:n {<math>\langle object \rangle</math>}</code>
----------------------------------	--

---

<small>New: 2021-02-10</small>	Inserts the appropriate information to reference the $\langle object \rangle$ in for example page resource allocation. If the $\langle object \rangle$ does not exist then the function expands to a reference to object zero; no PDF indirect object ever has this number, so this is a marker for error.
--------------------------------	--

---

---

<code>\pdf_object_if_exist_p:n *</code>	<code>\pdf_object_if_exist_p:n {<math>\langle object \rangle</math>}</code>
---	---

---

<code>\pdf_object_if_exist:nTF *</code>	<code>\pdf_object_if_exist:nTF {<math>\langle object \rangle</math>} {<math>\langle true code \rangle</math>} {<math>\langle false code \rangle</math>}</code>
---	--

---

<small>New: 2020-05-15</small>	Tests whether an object with name $\{ \langle object \rangle \}$ has been defined.
--------------------------------	--

---

### 40.1.2 Indexed objects

Objects can also be created using a pair of  $\langle class \rangle$  and  $index$ ; the  $\langle class \rangle$  argument should expand to character tokens, whilst the  $\langle index \rangle$  is an  $\langle int\ expr \rangle$  and starts at 1. For large families of objects, this approach is more efficient than using individual names.

---

```
\pdf_object_new_indexed:nn \pdf_object_new_indexed:nn {\langle class \rangle} {\langle index \rangle}
```

---

New: 2024-04-01 Declares a PDF object of  $\langle class \rangle$  and  $\langle index \rangle$ . The object may be referenced from this point on, and written later using  $\backslash pdf\_object\_write\_indexed:nnnn$ .

---

---

```
\pdf_object_write_indexed:nnnn \pdf_object_write_indexed:nnnn {\langle class \rangle} {\langle index \rangle} {\langle type \rangle} {\langle content \rangle}
\pdf_object_write_indexed:nnne
```

---

New: 2024-04-01

---

Writes the  $\langle content \rangle$  as content of the object of  $\langle class \rangle$  and  $\langle index \rangle$ . Depending on the  $\langle type \rangle$  declared for the object, the format required for the  $\langle content \rangle$  will vary

**array** A space-separated list of values

**dict** Key-value pairs in the form  $/\langle key \rangle \langle value \rangle$

**fstream** Two brace groups:  $\langle file\ name \rangle$  and  $\langle file\ content \rangle$

**stream** Two brace groups:  $\langle attributes\ (dictionary) \rangle$  and  $\langle stream\ contents \rangle$

---

```
\pdf_object_ref_indexed:nn * \pdf_object_ref_indexed:nn {\langle class \rangle} {\langle index \rangle}
```

---

New: 2024-04-01

---

Inserts the appropriate information to reference the object of  $\langle class \rangle$  and  $\langle index \rangle$  in for example page resource allocation. If the  $\langle class \rangle/\langle index \rangle$  combination does not exist then the function expands to a reference to object zero; no PDF indirect object ever has this number, so this is a marker for error.

### 40.1.3 General functions

---

```
\pdf_object_unnamed_write:nn \pdf_object_unnamed_write:nn {\langle type \rangle} {\langle content \rangle}
\pdf_object_unnamed_write:ne
```

---

New: 2021-02-10

---

Writes the  $\langle content \rangle$  as content of an anonymous object. Depending on the  $\langle type \rangle$ , the format required for  $\langle content \rangle$  will vary:

**array** A space-separated list of values

**dict** Key-value pairs in the form  $/\langle key \rangle \langle value \rangle$

**fstream** Two brace groups:  $\langle attributes\ (dictionary) \rangle$  and  $\langle file\ name \rangle$

**stream** Two brace groups:  $\langle attributes\ (dictionary) \rangle$  and  $\langle stream\ contents \rangle$

<hr/>	
<code>\pdf_object_ref_last: *</code>	<code>\pdf_object_ref_last:</code>
<hr/>	
<code>New: 2021-02-10</code>	Inserts the appropriate information to reference the last <code>&lt;object&gt;</code> created. This is particularly useful for anonymous objects.
<hr/>	
<code>\pdf_pageobject_ref:n *</code>	<code>\pdf_pageobject_ref:n {&lt;abspage&gt;}</code>
<hr/>	
<code>New: 2021-02-10</code>	Inserts the appropriate information to reference the <code>&lt;abspage&gt;</code> ; the latter is expanded fully before further processing.
<code>Updated: 2024-04-22</code>	
<hr/>	

## 40.2 Version

<hr/>	
<code>\pdf_version_compare_p:Nn *</code>	<code>\pdf_version_compare_p:Nn &lt;relation&gt; {&lt;version&gt;}</code>
<code>\pdf_version_compare:NnTF *</code>	<code>\pdf_version_compare:NnTF &lt;relation&gt; {&lt;version&gt;} {&lt;true code&gt;} {&lt;false code&gt;}</code>
<hr/>	
<code>New: 2021-02-10</code>	
<hr/>	

Compares the version of the PDF being created with the `<version>` string specified, using the `<relation>`. Either the `<true code>` or `<false code>` will be left in the output stream.

<hr/>	
<code>\pdf_version_gset:n</code>	<code>\pdf_version_gset:n {&lt;version&gt;}</code>
<code>\pdf_version_min_gset:n</code>	Sets the <code>&lt;version&gt;</code> of the PDF being created. The <code>min</code> version will not alter the output version unless it is currently lower than the <code>&lt;version&gt;</code> requested.
<hr/>	
<code>New: 2021-02-10</code>	This function may only be used up to the point where the PDF file is initialised. With dvips it sets <code>\pdf_version_major:</code> and <code>\pdf_version_minor:</code> and allows to compare the values with <code>\pdf_version_compare:Nn</code> , but the PDF version itself still has to be set with the command line option <code>-dCompatibilityLevel</code> of <code>ps2pdf</code> .
<hr/>	

<hr/>	
<code>\pdf_version: *</code>	<code>\pdf_version:</code>
<code>\pdf_version_major: *</code>	Expands to the currently-active PDF version.
<code>\pdf_version_minor: *</code>	
<hr/>	
<code>New: 2021-02-10</code>	
<hr/>	

## 40.3 Page (media) size

<hr/>	
<code>\pdf_pagesize_gset:n</code>	<code>\pdf_pagesize_gset:n {&lt;width&gt;} {&lt;height&gt;}</code>
<hr/>	
<code>New: 2023-01-14</code>	Sets the page size (mediabox) of the PDF being created to the <code>&lt;width&gt;</code> and <code>&lt;height&gt;</code> , both of which are <code>&lt;dimexpr&gt;</code> . The page size can only be set at the start of the output with dvips; with other backends, this can be adjusted on a per-page basis.
<hr/>	

## 40.4 Compression

<hr/>	
<code>\pdf_uncompress:</code>	<code>\pdf_uncompress:</code>
<hr/>	
<code>New: 2021-02-10</code>	Disables any compression of the PDF, where possible.
<hr/>	This function may only be used up to the point where the PDF file is initialised.

40.5 Destinations

Destinations are the places a link jumped to. Unlike the name may suggest, they don't describe an exact location in the PDF. Instead, a destination contains a reference to a page along with an instruction how to display this page. The normally used “XYZ *top left zoom*” for example instructs the viewer to show the page with the given *zoom* and the top left corner at the *top left* coordinates—which then gives the impression that there is an anchor at this position.

If an instruction takes a coordinate, it is calculated by the following commands relative to the location the command is issued. So to get a specific coordinate one has to move the command to the right place.

<code>\pdf_destination:nn</code>	<code>\pdf_destination:nn {&lt;name&gt;} {&lt;type or integer&gt;}</code>
New: 2021-01-03	This creates a destination. {<type or integer>} can be one of <code>fit</code> , <code>fith</code> , <code>fitv</code> , <code>fitb</code> , <code>fitbh</code> , <code>fitbv</code> , <code>fitr</code> , <code>xyz</code> or an integer representing a scale factor in percent. <code>fitr</code> here gives only a lightweight version of <code>/FitR</code> : The backend code defines <code>fitr</code> so that it will with pdfL <sup>A</sup> T <sub>E</sub> X and LuaL <sup>A</sup> T <sub>E</sub> X use the coordinates of the surrounding box, with dvips and dvipdfmx it falls back to <code>fit</code> . For full control use <code>\pdf_destination:nnnn</code> . The keywords match to the PDF names as described in the following tabular.

Keyword	PDF	Remarks
<code>fit</code>	<code>/Fit</code>	Fits the page to the window
<code>fith</code>	<code>/FitH top</code>	Fits the width of the page to the window
<code>fitv</code>	<code>/FitV left</code>	Fits the height of the page to the window
<code>fitb</code>	<code>/FitB</code>	Fits the page bounding box to the window
<code>fitbh</code>	<code>/FitBH top</code>	Fits the width of the page bounding box to the window.
<code>fitbv</code>	<code>/FitBV left</code>	Fits the height of the page bounding box to the window.
<code>fitr</code>	<code>/FitR left bottom right top</code>	Fits the rectangle specified by the four coordinates to the window (see above for the restrictions)
<code>xyz</code>	<code>/XYZ left top null</code>	Sets a coordinate but doesn't change the zoom.
<code>{&lt;integer&gt;}</code>	<code>/XYZ left top zoom</code>	Sets a coordinate and a zoom meaning {<integer>}%.

<code>\pdf_destination:nnnn</code>	<code>\pdf_destination:nnnn {&lt;name&gt;} {&lt;width&gt;} {&lt;height&gt;} {&lt;depth&gt;}</code>
New: 2021-01-17	This creates a destination with <code>/FitR</code> type with the given dimensions relative to the current location. The destination is in a box of size zero, but it doesn't switch to horizontal mode.

**Part VII**  
**Utilities**

# Chapter 41

## The `benchmark` module

### Benchmarking

#### 41.1 Benchmark

<code>\g_benchmark_duration_target_fp</code>
New: 2025-03-17

This variable (default value: 1) controls roughly for how long `\benchmark:n` will repeat code to more accurately benchmark it. The actual duration of one call to `\benchmark:n` typically lasts between half and twice `\g_benchmark_duration_target_fp` seconds, unless of course running the code only once already lasts longer than this.

<code>\g_benchmark_time_fp</code> <code>\g_benchmark_ops_fp</code>	These variables store the results of the most recently run benchmark. <code>\g_benchmark_time_fp</code> stores the time TeX took in seconds, and <code>\g_benchmark_ops_fp</code> stores the estimated number of elementary operations. The latter is not set by <code>\benchmark_tic:/benchmark_toc:</code> .
New: 2025-03-17	

<code>\benchmark_once:n</code> <code>\benchmark_once_silent:n</code>	<code>\benchmark_once_silent:n {&lt;code&gt;}</code> <code>\benchmark_once:n {&lt;code&gt;}</code>
New: 2025-03-17	Determines the time <code>\g_benchmark_time_fp</code> (in seconds) taken by TeX to run the <code>&lt;code&gt;</code> , and an estimated number <code>\g_benchmark_ops_fp</code> of elementary operations. In addition, <code>\benchmark_once:n</code> prints these values to the terminal. The <code>&lt;code&gt;</code> is run only once so the time may be quite inaccurate for fast code.

<code>\benchmark:n</code> <code>\benchmark_silent:n</code>	<code>\benchmark:n {&lt;code&gt;}</code>
New: 2025-03-17	Determines the time <code>\g_benchmark_time_fp</code> (in seconds) taken by TeX to run the <code>&lt;code&gt;</code> , and an estimated number <code>\g_benchmark_ops_fp</code> of elementary operations. In addition, <code>\benchmark:n</code> prints these values to the terminal. The <code>&lt;code&gt;</code> may be run many times and not within a group, thus code with side-effects may cause problems.

---

`\benchmark_tic:` `\benchmark_tic: <slow code> \benchmark_toc:`

`\benchmark_toc:`

---

New: 2025-03-17

When it is not possible to run `\benchmark:n` (e.g., the code is part of the execution of a package which cannot be looped) the tic/toc commands can be used instead to time between two points in the code. When executed, `\benchmark_tic:` will print a line to the terminal, and `\benchmark_toc:` will print a matching line with a time to indicate the duration between them in seconds. These commands can be nested.

**Part VIII**  
**Implementation**

## Chapter 42

# l3bootstrap implementation

```
1 <*code>
2 <@@=kernel>
```

### 42.1 The `\pdfstrcmp` primitive in $\text{\TeX}$

Only pdf $\text{\TeX}$  has a primitive called `\pdfstrcmp`. The  $\text{\TeX}$  version is just `\strcmp`, so there is some shuffling to do. As this is still a real primitive, using the pdf $\text{\TeX}$  name is “safe”.

```
3 \begingroup\expandafter\expandafter\expandafter\endgroup
4 \expandafter\ifx\csname pdfstrcmp\endcsname\relax
5 \let\pdfstrcmp\strcmp
6 \fi
```

### 42.2 Loading support Lua code

When Lua $\text{\TeX}$  is used there are various pieces of Lua code which need to be loaded. The code itself is defined in `l3luatex` and is extracted into a separate file. Thus here the task is to load the Lua code both now and (if required) at the start of each job.

```
7 \begingroup\expandafter\expandafter\expandafter\endgroup
8 \expandafter\ifx\csname directlua\endcsname\relax
9 \else
10 \ifnum\luatexversion<110 %
11 \else
```

For Lua $\text{\TeX}$  we make sure the basic support is loaded: this is only necessary in plain.

```
12 \begingroup\expandafter\expandafter\expandafter\endgroup
13 \expandafter\ifx\csname newcatcodetable\endcsname\relax
14 \input{ltluatex}%
15 \fi
16 \begingroup\expandafter\expandafter\expandafter\endgroup
17 \expandafter\ifx\csname newluabytecode\endcsname\relax
18 \else
19 \newluabytecode{@expl@luadata@bytecode
20 \fi
21 \directlua{require("expl3")}%
```

As the user might be making a custom format, no assumption is made about matching package mode with only loading the Lua code once. Instead, a query to Lua reveals what mode is in operation.

```

22 \ifnum 0%
23 \directlua{
24   if status.ini_version then
25     tex.write("1")
26   end
27 }>0 %
28 \everyjob\expandafter{%
29   \the\expandafter\everyjob
30   \csname\detokenize{lua_now:n}\endcsname{require("expl3")}}%
31 }%
32 \fi
33 \fi
34 \fi

```

## 42.3 Engine requirements

The code currently requires  $\varepsilon$ -TeX, the set of “pdfTeX extensions” *including* `\expanded`, and for Unicode engines the ability to generate arbitrary character tokens by expansion. That is covered by all supported engines since TeX Live 2019, which we therefore use as a baseline for engine and L<sup>A</sup>TeX format support. For LuaTeX, we require at least Lua 5.3 and the `token.set_lua` function. This is available at least since LuaTeX 1.10, which again is the one in TeX Live 2019. (u)pTeX only gained `\ifincsname` for TeX Live 2020, but at present that primitive is unused in expl3 so for the present it’s not tested. If and when that changes, we will need to revisit the code here.

```

35 \begingroup

```

## 42.4 The L<sup>A</sup>T<sub>E</sub>X3 code environment

The code environment is now set up.

**\ExplSyntaxOff** Before changing any category codes, in package mode we need to save the situation before loading. Note the set up here means that once applied \ExplSyntaxOff becomes a “do nothing” command until \ExplSyntaxOn is used.

```

82 \protected\edef\ExplSyntaxOff
83 {%
84     \protected\def\noexpand\ExplSyntaxOff{}%
85     \catcode 9 = \the\catcode 9\relax
86     \catcode 32 = \the\catcode 32\relax
87     \catcode 34 = \the\catcode 34\relax
88     \catcode 58 = \the\catcode 58\relax
89     \catcode 94 = \the\catcode 94\relax
90     \catcode 95 = \the\catcode 95\relax
91     \catcode 124 = \the\catcode 124\relax
92     \catcode 126 = \the\catcode 126\relax
93     \endlinechar = \the\endlinechar\relax
94     \chardef\csname\detokenize{l__kernel_expl_bool}\endcsname = 0\relax
95     }%

```

(End of definition for \ExplSyntaxOff. This function is documented on page 10.)

The code environment is now set up.

```

96 \catcode 9 = 9\relax
97 \catcode 32 = 9\relax
98 \catcode 34 = 12\relax
99 \catcode 58 = 11\relax
100 \catcode 94 = 7\relax
101 \catcode 95 = 11\relax

```

```

102 \catcode 124 = 12\relax
103 \catcode 126 = 10\relax
104 \endlinechar = 32\relax

```

\l\_\_kernel\_expl\_bool The status for code syntax: this is on at present.

```

105 \global\chardef\l__kernel_expl_bool = 1\relax

```

(End of definition for \l\_\_kernel\_expl\_bool.)

**\ExplSyntaxOn** The idea here is that multiple \ExplSyntaxOn calls are not going to mess up category codes, and that multiple calls to \ExplSyntaxOff are also not wasting time. Applying \ExplSyntaxOn alters the definition of \ExplSyntaxOff and so in package mode this function should not be used until after the end of the loading process!

```

106 \protected \def \ExplSyntaxOn
107 {
108   \bool_if:NF \l__kernel_expl_bool
109   {
110     \cs_set_protected:Npe \ExplSyntaxOff

136 }

```

(End of definition for \ExplSyntaxOn. This function is documented on page 10.)

```

137 </code>

```

## Chapter 43

# l3names implementation

The prefix here is `kernel`. A few places need `@@` to be left as is; this is obtained as `@@@@`.

```
138 <@@=kernel>
```

```
139 <*code>
```

The code here simply renames all of the primitives to new, internal, names.

The `\let` primitive is renamed by hand first as it is essential for the entire process to follow. This also uses `\global`, as that way we avoid leaving an unneeded csname in the hash table.

```
140 \let \tex_global:D \global
```

```
141 \let \tex_let:D \let
```

Everything is inside a (rather long) group, which keeps `\__kernel_primitive:NN` trapped.

```
142 \begingroup
```

`\__kernel_primitive:NN` A temporary function to actually do the renaming.

```
143 \long \def \__kernel_primitive:NN #1#2
```

```
144 { \tex_global:D \tex_let:D #2 #1 }
```

*(End of definition for \\_\_kernel\_primitive:NN.)*

To allow extracting “just the names”, a bit of DocStrip fiddling.

```
145 </code>
```

```
146 <*names|code>
```

In the current incarnation of this module, all T<sub>E</sub>X primitives are given a new name of the form `\tex_oldname:D`. But first three special cases which have symbolic original names. These are given modified new names, so that they may be entered without catcode tricks.

```
147 \__kernel_primitive:NN \
```

```
\tex_space:D
```

```
148 \__kernel_primitive:NN \
```

```
\tex_italiccorrection:D
```

```
149 \__kernel_primitive:NN \-
```

```
\tex_hyphen:D
```

Now all the other primitives.

```
150 \__kernel_primitive:NN \above
```

```
\tex_above:D
```

```
151 \__kernel_primitive:NN \abovedisplayshortskip
```

```
\tex_abovedisplayshortskip:D
```

```
152 \__kernel_primitive:NN \abovedisplayskip
```

```
\tex_abovedisplayskip:D
```

```
153 \__kernel_primitive:NN \abovewithdelims
```

```
\tex_abovewithdelims:D
```

```
154 \__kernel_primitive:NN \accent
```

```
\tex_accent:D
```

Post- $\epsilon$ -TeX primitives do not always end up with the same name in all engines, if indeed they are available cross-engine anyway. We therefore take the approach of preferring the shortest name that makes sense. First, we deal with the primitives introduced by pdfTeX which directly relate to PDF output: these are copied with the names unchanged.

538	<code>\_kernel\_primitive:NN</code>	<code>\pdfannot</code>	<code>\tex\_pdfannot:D</code>
539	<code>\_kernel\_primitive:NN</code>	<code>\pdfcatalog</code>	<code>\tex\_pdfcatalog:D</code>

684 \__kernel_primitive:NN \tagcode \tex_tagcode:D

```

Post pdfTeX primitive availability gets more complex. Both XeTeX and LuaTeX have varying names for some primitives from pdfTeX. Particularly for LuaTeX tracking all of that would be hard. Instead, we now check that we only save primitives if they actually exist.

```

697 <*names | code>

```

Some pdfTeX primitives are handled here because they got dropped in LuaTeX but the corresponding internal names are emulated later. The Lua code is already loaded at this point, so we shouldn't overwrite them.

```

698 \__kernel_primitive:NN \pdfstrcmp \tex_strcmp:D
699 \__kernel_primitive:NN \pdffilesize \tex_filesize:D
700 \__kernel_primitive:NN \pdfmdfivesum \tex_mdfivesum:D
701 \__kernel_primitive:NN \pdffilemoddate \tex_filemoddate:D
702 \__kernel_primitive:NN \pdffiledump \tex_filedump:D

```

XeTeX-specific primitives. Note that XeTeX's \strcmp is handled earlier and is “rolled up” into \pdfstrcmp. A few cross-compatibility names which lack the pdf of the original are handled later.

```

The set of Unicode math primitives were introduced by X<sub>Y</sub>TeX and LuaTeX in a somewhat complex fashion: a few first as `\XeTeX...` which were then renamed with LuaTeX having a lot more. These names now all start `\U...` and mainly `\Umath...`.

1212 \__kernel_primitive:NN \omathcode \tex_omathcode:D
1213 \__kernel_primitive:NN \oradical \tex_oradical:D

```

Newer cross-engine primitives.

```

1214 \__kernel_primitive:NN \ignoreprimitiveerror \tex_ignoreprimitiveerror:D
1215 \__kernel_primitive:NN \partokencontext \tex_partokencontext:D
1216 \__kernel_primitive:NN \partokenname \tex_partokenname:D
1217 \__kernel_primitive:NN \showstream \tex_showstream:D
1218 \__kernel_primitive:NN \tracingstacklevels \tex_tracingstacklevels:D

```

End of the “just the names” part of the source.

```

1219 </names | code>
1220 <*code>

```

The job is done: close the group (using the primitive renamed!).

```

1221 \tex_endgroup:D

```

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> moves a few primitives, so these are sorted out. In newer versions of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, expl3 is loaded rather early, so only some primitives are already renamed, so we need two tests here. At the beginning of the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> format, the primitives `\end` and `\input` are renamed, and only later on the other ones.

```

1222 \tex_ifdefined:D \@@end
1223 \tex_let:D \tex_end:D \@@end
1224 \tex_let:D \tex_input:D \@@input
1225 \tex_fi:D

```

If `\@@@hyph` is defined, we are loading expl3 in a pre-2020/10/01 release of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, so a few other primitives have to be tested as well.

```

1226 \tex_ifdefined:D \@@hyph
1227 \tex_let:D \tex_everydisplay:D \frozen@everydisplay
1228 \tex_let:D \tex_everymath:D \frozen@everymath
1229 \tex_let:D \tex_hyphen:D \@@hyph
1230 \tex_let:D \tex_italiccorrection:D \@@italiccorr
1231 \tex_let:D \tex_underline:D \@@underline

```

The `\shipout` primitive is particularly tricky as a number of packages want to hook in here. First, we see if a sufficiently-new kernel has saved a copy: if it has, just use that. Otherwise, we need to check each of the possible packages/classes that might move it: here, we are looking for those which do *not* delay action to the `\AtBeginDocument`

hook. (We cannot use `\primitive` as that doesn't allow us to make a direct copy of the primitive *itself*.) As we know that  $\text{\LaTeX} 2_\epsilon$  is in use, we use its `\@tfor` loop here.

```

1232 \tex_ifdefined:D \@@shipout
1233 \tex_let:D \tex_shipout:D \@@shipout
1234 \tex_fi:D
1235 \tex_begingroup:D

1258 \tex_fi:D
1259 }
1260 \tex_fi:D
1261 \tex_endgroup:D

```

Some tidying up is needed for `\(pdf)tracingfonts`. Newer  $\text{\LaTeX}$  has this simply as `\tracingfonts`, but that is overwritten by the  $\text{\LaTeX} 2_\epsilon$  kernel. So any spurious definition has to be removed, then the real version saved either from the `pdfTeX` name or from  $\text{\LaTeX}$ . In the latter case, we leave `\@@tracingfonts` available: this might be useful and almost all  $\text{\LaTeX} 2_\epsilon$  users will have `expl3` loaded by `fontspec`. (We follow the usual kernel convention that `@@` is used for saved primitives.)

```

1262 \tex_let:D \tex_tracingfonts:D \tex_undefined:D

1336 \tex_fi:D
1337 </code>

```

In Lua<sub>T</sub><sub>E</sub>X, we additionally emulate some primitives using Lua code.

```

1338 <lua>

```

`\tex_strcmp:D` Compare two strings, expanding to 0 if they are equal, -1 if the first one is smaller and 1 if the second one is smaller. Here “smaller” refers to codepoint order which does not correspond to the user expected order for most non-ASCII strings.

```

1339 local minus_tok = token_new(string.byte'-' , 12)
1340 local zero_tok = token_new(string.byte'0' , 12)
1341 local one_tok = token_new(string.byte'1' , 12)
1342 luacmd('tex_strcmp:D', function()
1343   local first = scan_string()
1344   local second = scan_string()
1345   if first < second then
1346     put_next(minus_tok, one_tok)
1347   else
1348     put_next(first == second and zero_tok or one_tok)
1349   end
1350 end, 'global')

```

*(End of definition for \tex\_strcmp:D.)*

`\tex_Ucharcat:D` Creating arbitrary chars using `tex.cprint`. The alternative approach using `token.new(...)` is about 10% slower but needed to create arbitrary space tokens.

```

1351 local sprint = tex.sprint
1352 local cprint = tex.cprint
1353 luacmd('tex_Ucharcat:D', function()
1354   local charcode = scan_int()
1355   local catcode = scan_int()
1356   if catcode == 10 then
1357     sprint(token_new(charcode, 10))
1358   else
1359     cprint(catcode, utf8_char(charcode))
1360   end
1361 end, 'global')

```

*(End of definition for \tex\_Ucharcat:D.)*

`\tex_filesize:D` Wrap the function from ltxutils.

```
1362 luacmd('tex_filesize:D', function()
1363   local size = filesize(scan_string())
1364   if size then write(size) end
1365 end, 'global')
```

*(End of definition for \tex\_filesize:D.)*

`\tex_md5sum:D` There are two cases: Either hash a file or a string. Both are already implemented in l3luatex or built-in.

```
1366 luacmd('tex_md5sum:D', function()
1367   local hash
1368   if scan_keyword"file" then
1369     hash = filemd5sum(scan_string())
1370   else
1371     hash = md5_HEX(scan_string())
1372   end
1373   if hash then write(hash) end
1374 end, 'global')
```

*(End of definition for \tex\_md5sum:D.)*

`\tex_filemoddate:D` A primitive for getting the modification date of a file.

```
1375 luacmd('tex_filemoddate:D', function()
1376   local date = filemoddate(scan_string())
1377   if date then write(date) end
1378 end, 'global')
```

*(End of definition for \tex\_filemoddate:D.)*

`\tex_filedump:D` An emulated primitive for getting a hexdump from a (partial) file. The length has a default of 0. This is consistent with pdfTEX, but it effectively makes the primitive useless without an explicit `length`. Therefore we allow the keyword `whole` to be used instead of a length, indicating that the whole remaining file should be read.

```
1379 luacmd('tex_filedump:D', function()
1380   local offset = scan_keyword'offset' and scan_int() or nil
1381   local length = scan_keyword'length' and scan_int()
1382               or not scan_keyword'whole' and 0 or nil
1383   local data = filedump(scan_string(), offset, length)
1384   if data then write(data) end
1385 end, 'global')
```

*(End of definition for \tex\_filedump:D.)*

```
1386 </lua>
```

## Chapter 44

# I3kernel-functions: kernel-reserved functions

### 44.1 Internal I3debug kernel functions

These function are only created if debugging is enabled, hence they are actually defined in I3debug.

---

<code>\__kernel_chk_var_local:N</code>	<code>\__kernel_chk_var_local:N &lt;var&gt;</code>
<code>\__kernel_chk_var_global:N</code>	<code>\__kernel_chk_var_global:N &lt;var&gt;</code>

---

Applies `\__kernel_chk_var_exist:N <var>` as well as `\__kernel_chk_var_scope:NN <scope> <var>`, where `<scope>` is l or g.

---

<code>\__kernel_chk_var_scope:NN</code>	<code>\__kernel_chk_var_scope:NN &lt;scope&gt; &lt;var&gt;</code>
---	---

---

Checks the `<var>` has the correct `<scope>`, and if not raises a kernel-level error. The `<scope>` is a single letter l, g, c denoting local variables, global variables, or constants. More precisely, if the variable name starts with a letter and an underscore (normal expl3 convention) the function checks that this single letter matches the `<scope>`. Otherwise the function cannot know the scope `<var>` the first time: instead, it defines `\__debug_chk_<var name>` to store that information for the next call. Thus, if a given `<var>` is subject to assignments of different scopes a kernel error will result.

---

<code>\__kernel_chk_cs_exist:N</code>	<code>\__kernel_chk_cs_exist:N &lt;cs&gt;</code>
<code>\__kernel_chk_cs_exist:c</code>	<code>\__kernel_chk_var_exist:N &lt;var&gt;</code>
<code>\__kernel_chk_var_exist:N</code>	

---

Checks that their argument is defined according to the criteria for `\cs_if_exist_p:N`, and if not raises a kernel-level error. Error messages are different.

---

<code>\__kernel_chk_flag_exist:NN</code>	<code>\__kernel_chk_flag_exist:NN</code>
	<code>&lt;function&gt; &lt;flag&gt;</code>

---

Checks that the `<flag>` is defined according to the criterion for `\flag_if_exist_p:N`, and if not raises a kernel-level error and calls the function with the argument `\l_tmpa_flag` to proceed somehow without producing too many errors.

---

`\_kernel\_debug\_log:e` `\_kernel\_debug\_log:e {⟨message text⟩}`

---

If the `log-functions` option is active, this function writes the `⟨message text⟩` to the log file using `\iow_log:e`. Otherwise, the `⟨message text⟩` is ignored using `\use_none:n`.

## 44.2 Internal kernel functions

---

`\_kernel\_chk\_defined:NT` `\_kernel\_chk\_defined:NT {⟨variable⟩} {⟨true code⟩}`

---

If `⟨variable⟩` is not defined (according to `\cs_if_exist:NTF`), this triggers an error, otherwise the `⟨true code⟩` is run.

---

`\_kernel\_chk\_expr:nNnN` `\_kernel\_chk\_expr:nNnN {⟨expr⟩} {⟨eval⟩} {⟨convert⟩} {⟨caller⟩}`

---

This function is only created if debugging is enabled. By default it is equivalent to `\use_i:nmmn`. When expression checking is enabled, it leaves in the input stream the result of `\tex_the:D {⟨eval⟩} {⟨expr⟩} \tex_relax:D` after checking that no token was left over. If any token was not taken as part of the expression, there is an error message displaying the result of the evaluation as well as the `⟨caller⟩`. For instance `⟨eval⟩` can be `\_int_eval:w` and `⟨caller⟩` can be `\int_eval:n` or `\int_set:Nn`. The argument `⟨convert⟩` is empty except for mu expressions where it is `\tex_mutoglue:D`, used for internal purposes.

---

`\_kernel\_chk\_tl\_type:NnnT` `\_kernel\_chk\_tl\_type:NnnT {⟨control sequence⟩} {⟨specific type⟩} {⟨reconstruction⟩} {⟨true code⟩}`

---

Helper to test that the `⟨control sequence⟩` is a variable of the given `⟨specific type⟩` of token list. Produces suitable error messages if the `⟨control sequence⟩` does not exist, or if it is not a token list variable at all, or if the `⟨control sequence⟩` differs from the result of e-expanding `⟨reconstruction⟩`. If all of these tests succeed then the `⟨true code⟩` is run.

---

`\_kernel\_codepoint\_to\_bytes:n` `\_kernel\_codepoint\_to\_bytes:n {⟨codepoint⟩}`

---

Converts the `⟨codepoint⟩` to UTF-8 bytes. The expansion of this function comprises four brace groups, each of which will contain a hexadecimal value: the appropriate byte. As UTF-8 is a variable-length, one or more of the groups may be empty: the bytes read in the logical order, such that a two-byte codepoint will have groups #1 and #2 filled and #3 and #4 empty.

---

`\_kernel\_codepoint\_to\_grapheme\_class:n` `\_kernel\_codepoint\_to\_grapheme\_class:n {⟨codepoint⟩}`  
`\_kernel\_codepoint\_to\_wordbreak\_class:n` `\_kernel\_codepoint\_to\_wordbreak\_class:n {⟨codepoint⟩}`

---

Expands to the Unicode properties `Grapheme_Cluster_Break` and `Word_Break`, respectively, of the `⟨codepoint⟩`. Here, `Grapheme_Cluster_Break` and `Word_Break` are strings matching exactly the descriptors given in <https://www.unicode.org/reports/tr29/>.

---

```
\_kernel_cs_parm_from_arg_count:nnF \_kernel_cs_parm_from_arg_count:nnF {<follow-on>} {<args>} {<>false
code>}
```

---

Evaluates the number of `<args>` and leaves the `<follow-on>` code followed by a brace group containing the required number of primitive parameter markers (`#1`, *etc.*). If the number of `<args>` is outside the range  $[0, 9]$ , the `<>false code>` is inserted *instead* of the `<follow-on>`.

---

```
\_kernel_dependency_version_check:Nn \_kernel_dependency_version_check:Nn {\date} {\file}
\_kernel_dependency_version_check:nn \_kernel_dependency_version_check:nn {\date} {\file}
```

---

Checks if the loaded version of the expl3 kernel is at least `<date>`, required by `<file>`. If the kernel date is older than `<date>`, the loading of `<file>` is aborted and an error is raised.

---

```
\_kernel_deprecation_code:nn \_kernel_deprecation_code:nn {\error code} {\working code}
```

---

Stores both an `<error>` and `<working>` definition for given material such that they can be exchanged by `\debug_on:n` and `\debug_off:n`.

---

```
\_kernel_exp_not:w * \_kernel_exp_not:w <expandable tokens> {\content}
```

---

Carries out expansion on the `<expandable tokens>` before preventing further expansion of the `<content>` as for `\exp_not:n`. Typically, the `<expandable tokens>` will alter the nature of the `<content>`, i.e., allow it to be generated in some way.

```
\l__kernel_expl_bool
```

A boolean which records the current code syntax status: `true` if currently inside a code environment. This variable should only be set by `\ExplSyntaxOn/\ExplSyntaxOff`.

(End of definition for `\l__kernel_expl_bool`.)

```
\c__kernel_expl_date_tl
```

A token list containing the release date of the l3kernel preloaded in L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> used to check if dependencies match.

(End of definition for `\c__kernel_expl_date_tl`.)

---

```
\_kernel_file_missing:n \_kernel_file_missing:n {\name}
```

---

Expands the `<name>` as per `\_kernel_file_name_sanitiz:n` then produces an error message indicating that this file was not found.

---

```
\_kernel_file_name_sanitiz:n * \_kernel_file_name_sanitiz:n {\name}
```

---

Updated: 2021-04-17

---

Expands the file name using a `\csname`-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to an expansion-safe version using `\ifcsname`. This is less conservative than the token-by-token approach used before, but it is much faster.

---

```
\_kernel_file_input_push:n \_kernel_file_input_push:n {\name}
\_kernel_file_input_pop: \_kernel_file_input_pop:
```

---

Used to push and pop data from the internal file stack: needed only in package mode, where interfacing with the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> kernel is necessary.

---

 $\backslash\_kernel\_int\_add:nnn$   $\star$   $\backslash\_kernel\_int\_add:nnn \{\langle integer_1 \rangle\} \{\langle integer_2 \rangle\} \{\langle integer_3 \rangle\}$ 

---

Expands to the result of adding the three  $\langle integer \rangle$  (which must be suitable input for  $\backslash int\_eval:w$ ), avoiding intermediate overflow. Overflow occurs only if the overall result is outside  $[-2^{31} + 1, 2^{31} - 1]$ . The  $\langle integer \rangle$  may be of the form  $\backslash int\_eval:w \dots \backslash scan\_stop:$  but may be evaluated more than once.

---

 $\backslash\_kernel\_int\_sep:$   $\star$   $\backslash\_kernel\_int\_sep:$ 

---

Provides a way to stop the expansion in  $\backslash tex\_numexpr:D$  with a token that is not absorbed so that it works as a marker for right-delimited arguments. Additionally the used token should be impossible to form a valid expression for these expression primitives (the otherwise previously-used  $;$  is turned into a binary operator in some engines for instance). An unexpandable primitive is used because it is guaranteed to never be a valid token in such an expression and survives all kinds of expansion (just like  $;$  would in  $\epsilon$ -TeX).

---

 $\backslash\_kernel\_intarray\_gset:Nnn$   $\backslash\_kernel\_intarray\_gset:Nnn \langle intarray\ var \rangle \{\langle index \rangle\} \{\langle value \rangle\}$ 

---

New: 2018-03-31

Faster version of  $\backslash intarray\_gset:Nnn$ . Stores the  $\langle value \rangle$  into the  $\langle integer\ array\ variable \rangle$  at the  $\langle position \rangle$ . The  $\langle index \rangle$  and  $\langle value \rangle$  must be suitable for a direct assignment to a TeX count register, for instance expanding to an integer denotation or obtained through the primitive  $\backslash numexpr$  (which may be un-terminated). No bound checking is performed: the caller is responsible for ensuring that the  $\langle position \rangle$  is between 1 and the  $\backslash intarray\_count:N$ , and the  $\langle value \rangle$ 's absolute value is at most  $2^{30} - 1$ . Assignments are always global.

---

 $\backslash\_kernel\_intarray\_item:Nn$   $\star$   $\backslash\_kernel\_intarray\_item:Nn \langle intarray\ var \rangle \{\langle index \rangle\}$ 

---

New: 2018-03-31

Faster version of  $\backslash intarray\_item:Nn$ . Expands to the integer entry stored at the  $\langle index \rangle$  in the  $\langle integer\ array\ variable \rangle$ . The  $\langle index \rangle$  must be suitable for a direct assignment to a TeX count register and must be between 1 and the  $\backslash intarray\_count:N$ , lest a low-level TeX error occur.

---

 $\backslash\_kernel\_intarray\_range\_to\_clist:Nnn$   $\star$   $\backslash\_kernel\_intarray\_range\_to\_clist:Nnn \langle intarray\ var \rangle \{\langle start\ index \rangle\} \{\langle end\ index \rangle\}$ 

---

New: 2020-07-12

Converts to integer denotations separated by commas the entries of the  $\langle intarray \rangle$  from positions  $\langle start\ index \rangle$  to  $\langle end\ index \rangle$  included. The  $\langle start\ index \rangle$  and  $\langle end\ index \rangle$  must be suitable for a direct assignment to a TeX count register, must be between 1 and the  $\backslash intarray\_count:N$ , and be suitably ordered. All tokens have category code other.

---

 $\backslash\_kernel\_intarray\_gset\_range\_from\_clist:Nnn$   $\backslash\_kernel\_intarray\_gset\_range\_from\_clist:Nnn \langle intarray\ var \rangle \{\langle start\ index \rangle\} \{\langle integer\ clist \rangle\}$ 

---

New: 2020-07-12

Stores the entries of the  $\langle clist \rangle$  as entries of the  $\langle intarray\ var \rangle$  starting from the  $\langle start\ index \rangle$ , upwards. This is done without any bound checking. The  $\langle start\ index \rangle$  and all entries of the  $\langle integer\ comma\ list \rangle$  (which do not undergo space trimming and brace stripping as in normal clist mappings) must be suitable for a direct assignment to a TeX count register. An empty entry may stop the loop.

<hr/>	
<code>\__kernel_ior_open:Nn</code>	<code>\__kernel_ior_open:Nn &lt;stream&gt; {&lt;file name&gt;}</code>
<code>\__kernel_ior_open:No</code>	This function has identical syntax to the public version. However, it does not take precautions against active characters in the <code>&lt;file name&gt;</code> , and it does not attempt to add a <code>&lt;path&gt;</code> to the <code>&lt;file name&gt;</code> : it is therefore intended to be used by higher-level functions which have already fully expanded the <code>&lt;file name&gt;</code> and which need to perform multiple open or close operations. See for example the implementation of <code>\ior_shell_open:Nn</code> .
<hr/>	
<code>\__kernel_iow_open:Nn</code>	<code>\__kernel_iow_open:Nn &lt;stream&gt; {&lt;file name&gt;}</code>
<code>\__kernel_iow_open:No</code>	This function has identical syntax to the public version. However, it does not take precautions against active characters in the <code>&lt;file name&gt;</code> , and it does not attempt to add a <code>&lt;path&gt;</code> to the <code>&lt;file name&gt;</code> : it is therefore intended to be used by higher-level functions which have already fully expanded the <code>&lt;file name&gt;</code> and which need to perform multiple open or close operations. See for example the implementation of <code>\iow_shell_open:Nn</code> .
<hr/>	
<code>\__kernel_iow_with:Nnn</code>	<code>\__kernel_iow_with:Nnn &lt;integer&gt; {&lt;value&gt;} {&lt;code&gt;}</code>
	If the <code>&lt;integer&gt;</code> is equal to the <code>&lt;value&gt;</code> then this function simply runs the <code>&lt;code&gt;</code> . Otherwise it saves the current value of the <code>&lt;integer&gt;</code> , sets it to the <code>&lt;value&gt;</code> , runs the <code>&lt;code&gt;</code> , and restores the <code>&lt;integer&gt;</code> to its former value. This is used to ensure that the <code>\newlinechar</code> is 10 when writing to a stream, which lets <code>\iow_newline:</code> work, and that <code>\errorcontextlines</code> is -1 when displaying a message.
<hr/>	
<code>\__kernel_kern:n</code>	<code>\__kernel_kern:n {&lt;length&gt;}</code> Inserts a kern of the specified <code>&lt;length&gt;</code> , a dimension expression.  (End of definition for <code>\__kernel_kern:n</code> .)
<hr/>	
<code>\__kernel_msg_show_eval:Nn</code>	<code>\__kernel_msg_show_eval:Nn &lt;function&gt; {&lt;expression&gt;}</code>
<code>\__kernel_msg_log_eval:Nn</code>	Shows or logs the <code>&lt;expression&gt;</code> (turned into a string), an equal sign, and the result of applying the <code>&lt;function&gt;</code> to the <code>{&lt;expression&gt;}</code> (with <code>f</code> -expansion). For instance, if the <code>&lt;function&gt;</code> is <code>\int_eval:n</code> and the <code>&lt;expression&gt;</code> is <code>1+2</code> then this logs <code>&gt; 1+2=3</code> .
<hr/>	
<code>\__kernel_pdf_object_id:n</code>	<code>* \__kernel_pdf_object_id:n {&lt;object&gt;}</code>
<code>\__kernel_pdf_object_id_indexed:nn</code>	<code>* \__kernel_pdf_object_id_indexed:nn {&lt;class&gt;} {&lt;number&gt;}</code>
	Expands to the ID of <code>&lt;object&gt;</code> (or object of <code>&lt;number&gt;</code> within the <code>&lt;class&gt;</code> ), in for example page resource allocation. Depending on the backend, the result may be the same as <code>\pdf_object_id:n/\pdf_object_id_indexed:nn</code> .
<hr/>	
<code>\g__kernel_prg_map_int</code>	This integer is used by non-expandable mapping functions to track the level of nesting in force. The functions <code>\&lt;type&gt;_map_1:w</code> , <code>\&lt;type&gt;_map_2:w</code> , etc., labelled by <code>\g__kernel_prg_map_int</code> hold mappings to be mapped over various list datatypes in inline and variable mappings.  (End of definition for <code>\g__kernel_prg_map_int</code> .)

---

`\__kernel_quark_new_test:N \__kernel_quark_new_test:N \langle name \rangle: \langle arg spec \rangle`

---

Defines a quark-test function `\langle name \rangle: \langle arg spec \rangle` which tests if its argument is `\q__\langle namespace \rangle_recursion_tail`, then acts accordingly, as described below for each possible `\langle arg spec \rangle`.

The `\langle namespace \rangle` is determined as the first (nonempty) `_`-delimited word in `\langle name \rangle` and is used internally in the definition of auxiliaries. The function `\__kernel_quark_new_test:N` does *not* define the `\q__\langle namespace \rangle_recursion_tail` and `\q__\langle namespace \rangle_recursion_stop` quarks. They should be manually defined with `\quark_new:N`.

There are 6 different types of quark-test functions. Which one is defined depends on the `\langle arg spec \rangle`, which *must* be one of the options listed now. Four of them are modeled after `\quark_if_recursion_tail: (N|n)` and `\quark_if_recursion_tail_do: (N|n)n`.

`n` defines `\langle name \rangle:n` such that it checks if #1 contains only `\q__\langle namespace \rangle_recursion_tail`, and if so consumes all tokens up to `\q__\langle namespace \rangle_recursion_stop` (c.f. `\quark_if_recursion_tail_stop:n`).

`nn` defines `\langle name \rangle:nn` such that it checks if #1 contains only `\q__\langle namespace \rangle_recursion_tail`, and if so consumes all tokens up to `\q__\langle namespace \rangle_recursion_stop`, then executes the code #2 after that (c.f. `\quark_if_recursion_tail_stop_do:nn`).

`N` defines `\langle name \rangle:N` such that it checks if #1 is `\q__\langle namespace \rangle_recursion_tail`, and if so consumes all tokens up to `\q__\langle namespace \rangle_recursion_stop` (c.f. `\quark_if_recursion_tail_stop:N`).

`Nn` defines `\langle name \rangle:Nn` such that it checks if #1 is `\q__\langle namespace \rangle_recursion_tail`, and if so consumes all tokens up to `\q__\langle namespace \rangle_recursion_stop`, then executes the code #2 after that (c.f. `\quark_if_recursion_tail_stop_do:Nn`).

The last two are modeled after `\quark_if_recursion_tail_break: (n|N)N`, and in those cases the quark `\q__\langle namespace \rangle_recursion_stop` is not used (and thus needs not be defined).

`nN` defines `\langle name \rangle:nN` such that it checks if #1 contains only `\q__\langle namespace \rangle_recursion_tail`, and if so uses the `\langle type \rangle_map_break: function #2`.

`NN` defines `\langle name \rangle:NN` such that it checks if #1 is `\q__\langle namespace \rangle_recursion_tail`, and if so uses the `\langle type \rangle_map_break: function #2`.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.

---

`\__kernel_quark_new_conditional:Nn` `\__kernel_quark_new_conditional:Nn \__<namespace>_quark_if_<name>:<arg spec> {<conditions>}`

Defines a collection of quark conditionals that test if their argument is the quark `\q_<namespace>_<name>` and perform suitable actions. The `<conditions>` are a comma-separated list of one or more of p, T, F, and TF, and one conditional is defined for each `<condition>` in the list, as described for `\prg_new_conditional:Npnn`. The conditionals are defined using `\prg_new_conditional:Npnn`, so that their name is obtained by adding p, T, F, or TF to the base name `\__<namespace>_quark_if_<name>:<arg spec>`.

The first argument of `\__kernel_quark_new_conditional:Nn` must contain `_quark_if_` and `:`, as these markers are used to determine the `<name>` of the quark `\q_<namespace>_<name>` to be tested. This quark should be manually defined with `\quark_new:N`, as `\__kernel_quark_new_conditional:Nn` does *not* define it.

The function `\__kernel_quark_new_conditional:Nn` can define 2 different types of quark conditionals. Which one is defined depends on the `<arg spec>`, which *must* be one of the following options, modeled after `\quark_if_nil:(N|n)(TF)`.

`n` defines `\__<namespace>_quark_if_<name>:n(TF)` such that it checks if #1 contains only `\q_<namespace>_<name>`, and executes the proper conditional branch.

`N` defines `\__<namespace>_quark_if_<name>:N(TF)` such that it checks if #1 is `\q_<namespace>_<name>`, and executes the proper conditional branch.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.

---

`\__kernel_sys_everyjob:` `\__kernel_sys_everyjob:`

Inserts the internal token list required at the start of every run (job).

`\c__kernel_randint_max_int` Maximal allowed argument to `\__kernel_randint:n`. Equal to  $2^{17} - 1$ .

(End of definition for `\c__kernel_randint_max_int`.)

---

`\__kernel_randint:n` `\__kernel_randint:n {<max>}`

Used in an integer expression this gives a pseudo-random number between 1 and `<max>` included. One must have  $\langle max \rangle \leq 2^{17} - 1$ . The `<max>` must be suitable for `\int_value:w` (and any `\int_eval:w` must be terminated by `\scan_stop:` or equivalent).

---

`\__kernel_randint:nn` `\__kernel_randint:nn {<min>} {<max>}`

Used in an integer expression this gives a pseudo-random number between `<min>` and `<max>` included. The `<min>` and `<max>` must be suitable for `\int_value:w` (and any `\int_eval:w` must be terminated by `\scan_stop:` or equivalent). For small ranges  $R = \langle max \rangle - \langle min \rangle + 1 \leq 2^{17} - 1$ , `<min> - 1 + \__kernel_randint:n{R}` is faster.

---

`\__kernel_register_show:N` `\__kernel_register_show:N <register>`

`\__kernel_register_show:c` Used to show the contents of a T<sub>E</sub>X register at the terminal, formatted such that internal parts of the mechanism are not visible.

---

`\__kernel_register_log:N` `\__kernel_register_log:N <register>`

`\__kernel_register_log:c` Used to write the contents of a T<sub>E</sub>X register to the log file in a form similar to `\__kernel_register_show:N`.

---

\\_kernel\_str\_to\_other:n ★ \\_kernel\_str\_to\_other:n {<token list>}

---

Converts the <token list> to a <other string>, where spaces have category code “other”. This function can be f-expanded without fear of losing a leading space, since spaces do not have category code 10 in its result. It takes a time quadratic in the character count of the string.

---

\\_kernel\_str\_to\_other\_fast:n ☆ \\_kernel\_str\_to\_other\_fast:n {<token list>}

---

Same behaviour \\_kernel\_str\_to\_other:n but only restricted-expandable. It takes a time linear in the character count of the string.

---

\\_kernel\_tl\_to\_str:w ★ \\_kernel\_tl\_to\_str:w <expandable tokens> {<tokens>}

---

Carries out expansion on the <expandable tokens> before conversion of the <tokens> to a string as describe for \tl\_to\_str:n. Typically, the <expandable tokens> will alter the nature of the <tokens>, i.e., allow it to be generated in some way. This function requires only a single expansion.

---

\\_kernel\_tl\_set:Nx \\_kernel\_tl\_set:Nx <tl var> {<tokens>}

---

\\_kernel\_tl\_gset:Nx

Fully expands <tokens> and assigns the result to <tl var>. <tokens> must be given in braces and there must be no token between <tl var> and <tokens>.

---

\\_kernel\_codepoint\_data:nn ★ \\_kernel\_codepoint\_data:nn {<type>} {<codepoint>}

---

Expands to the appropriate value for the <type> of data requested for a <codepoint>. The current list of <types> and results are

**lowercase** The *single* codepoint specified by UnicodeData.txt for lowercase mapping of the codepoint: will be equal to the input <codepoint> if there is no mapping specified in UnicodeData.txt

**uppercase** The *single* codepoint specified by UnicodeData.txt for uppercase mapping of the codepoint: will be equal to the input <codepoint> if there is no mapping specified in UnicodeData.txt

---

\\_kernel\_codepoint\_case:nn ★ \\_kernel\_codepoint\_case:nn {<mapping>} {<codepoint>}

---

Expands to a list of three balanced text, of which at least the first will contain a codepoint. This list of up to three codepoints specifies the full case mapping for the input <codepoint>. The <mapping> should be one of

- casefold
- lowercase
- titlecase
- uppercase

## 44.3 Kernel backend functions

These functions are required to pass information to the backend. The nature of these means that they are defined only when the relevant backend is in use.

---

```
\_kernel_backend_literal:n \_kernel_backend_literal:n {<content>}
\_kernel_backend_literal:(e|e)
```

---

Adds the  $\langle content \rangle$  literally to the current vertical list as a whatsit. The nature of the  $\langle content \rangle$  will depend on the backend in use.

---

```
\_kernel_backend_literal_postscript:n \_kernel_backend_literal_postscript:n {<PostScript>}
\_kernel_backend_literal_postscript:e
```

---

Adds the  $\langle PostScript \rangle$  literally to the current vertical list as a whatsit. No positioning is applied.

---

```
\_kernel_backend_literal_pdf:n \_kernel_backend_literal_pdf:n {<PDF instructions>}
\_kernel_backend_literal_pdf:e
```

---

Adds the  $\langle PDF instructions \rangle$  literally to the current vertical list as a whatsit. No positioning is applied.

---

```
\_kernel_backend_literal_svg:n \_kernel_backend_literal_svg:n {<SVG instructions>}
\_kernel_backend_literal_svg:e
```

---

Adds the  $\langle SVG instructions \rangle$  literally to the current vertical list as a whatsit. No positioning is applied.

---

```
\_kernel_backend_postscript:n \_kernel_backend_postscript:n {<PostScript>}
\_kernel_backend_postscript:e
```

---

Adds the  $\langle PostScript \rangle$  to the current vertical list as a whatsit. The PostScript reference point is adjusted to match the current position. The PostScript is inserted inside a SDict begin/end pair.

---

```
\_kernel_backend_align_begin: \_kernel_backend_align_begin:
\_kernel_backend_align_end: <PostScript literals>
\_kernel_backend_align_end:
```

---

Arranges to align the PostScript and DVI current positions and scales.

---

```
\_kernel_backend_scope_begin: \_kernel_backend_scope_begin:
\_kernel_backend_scope_end: <content>
\_kernel_backend_scope_end:
```

---

Creates a scope for instructions at the backend level.

---

```
\_kernel_backend_matrix:n \_kernel_backend_matrix:n {<matrix>}
\_kernel_backend_matrix:e
```

---

Applies the  $\langle matrix \rangle$  to the current transformation matrix.

---

```
\g__kernel_backend_header_bool
```

---

Specifies whether to write headers for the backend.

---

<code>\l__kernel_color_stack_int</code>	The color stack used in pdfTeX and LuaTeX for the main color.
---	---

---

## Chapter 45

# l3basics implementation

1387 `\*code)`

### 45.1 Renaming some T<sub>E</sub>X primitives (again)

Having given all the T<sub>E</sub>X primitives a consistent name, we need to give sensible names to the ones we actually want to use. These will be defined as needed in the appropriate modules, but we do a few now, just to get started.<sup>8</sup>

<code>\if_true:</code>	Then some conditionals.
<code>\if_false:</code>	1388 <code>\tex_global:D \tex_let:D \if_true:</code> <code>\tex_iftrue:D</code>
<code>\or:</code>	1389 <code>\tex_global:D \tex_let:D \if_false:</code> <code>\tex_iffalse:D</code>
<code>\else:</code>	1390 <code>\tex_global:D \tex_let:D \or:</code> <code>\tex_or:D</code>
<code>\fi:</code>	1391 <code>\tex_global:D \tex_let:D \else:</code> <code>\tex_else:D</code>
<code>\reverse_if:N</code>	1392 <code>\tex_global:D \tex_let:D \fi:</code> <code>\tex_fi:D</code>
<code>\if:w</code>	1393 <code>\tex_global:D \tex_let:D \reverse_if:N</code> <code>\tex_unless:D</code>
<code>\if_charcode:w</code>	1394 <code>\tex_global:D \tex_let:D \if:w</code> <code>\tex_if:D</code>
<code>\if_catcode:w</code>	1395 <code>\tex_global:D \tex_let:D \if_charcode:w</code> <code>\tex_if:D</code>
<code>\if_meaning:w</code>	1396 <code>\tex_global:D \tex_let:D \if_catcode:w</code> <code>\tex_ifcat:D</code>
	1397 <code>\tex_global:D \tex_let:D \if_meaning:w</code> <code>\tex_ifx:D</code>
	1398 <code>\tex_global:D \tex_let:D \if_bool:N</code> <code>\tex_ifodd:D</code>

*(End of definition for `\if_true:` and others. These functions are documented on page 29.)*

<code>\if_mode_math:</code>	T <sub>E</sub> X lets us detect some if its modes.
<code>\if_mode_horizontal:</code>	1399 <code>\tex_global:D \tex_let:D \if_mode_math:</code> <code>\tex_ifmmode:D</code>
<code>\if_mode_vertical:</code>	1400 <code>\tex_global:D \tex_let:D \if_mode_horizontal:</code> <code>\tex_ifhmode:D</code>
<code>\if_mode_inner:</code>	1401 <code>\tex_global:D \tex_let:D \if_mode_vertical:</code> <code>\tex_ifvmode:D</code>
	1402 <code>\tex_global:D \tex_let:D \if_mode_inner:</code> <code>\tex_ifinner:D</code>

*(End of definition for `\if_mode_math:` and others. These functions are documented on page 30.)*

<code>\if_cs_exist:N</code>	Building csnames and testing if control sequences exist.
<code>\if_cs_exist:w</code>	1403 <code>\tex_global:D \tex_let:D \if_cs_exist:N</code> <code>\tex_ifdefined:D</code>
<code>\cs:w</code>	1404 <code>\tex_global:D \tex_let:D \if_cs_exist:w</code> <code>\tex_ifcurname:D</code>
<code>\cs_end:</code>	1405 <code>\tex_global:D \tex_let:D \cs:w</code> <code>\tex_csname:D</code>
	1406 <code>\tex_global:D \tex_let:D \cs_end:</code> <code>\tex_endcurname:D</code>

<sup>8</sup>This renaming gets expensive in terms of csname usage, an alternative scheme would be to just use the `\tex_...:D` name in the cases where no good alternative exists.

(End of definition for `\if_cs_exist:N` and others. These functions are documented on page 30.)

`\exp_after:wN` The five `\exp_` functions are used in the `l3expan` module where they are described.

```

1407 \tex_global:D \tex_let:D \exp_after:wN      \tex_expandafter:D
1408 \tex_global:D \tex_let:D \exp_not:N         \tex_noexpand:D
1409 \tex_global:D \tex_let:D \exp_not:n         \tex_unexpanded:D
1410 \tex_global:D \tex_let:D \exp:w             \tex_romannumeral:D
1411 \tex_global:D \tex_chardef:D \exp_end:  = 0 ~

```

(End of definition for `\exp_after:wN`, `\exp_not:N`, and `\exp_not:n`. These functions are documented on page 41.)

`\token_to_meaning:N` Examining a control sequence or token.

```

1412 \tex_global:D \tex_let:D \token_to_meaning:N \tex_meaning:D
1413 \tex_global:D \tex_let:D \cs_meaning:N      \tex_meaning:D

```

(End of definition for `\token_to_meaning:N` and `\cs_meaning:N`. These functions are documented on page 207.)

`\tl_to_str:n` Making strings.

```

1414 \tex_global:D \tex_let:D \tl_to_str:n      \tex_detokenize:D
1415 \tex_global:D \tex_let:D \token_to_str:N    \tex_string:D
1416 \tex_global:D \tex_let:D \__kernel_tl_to_str:w \tex_detokenize:D

```

(End of definition for `\tl_to_str:n`, `\token_to_str:N`, and `\__kernel_tl_to_str:w`. These functions are documented on page 118.)

`\scan_stop:` The next three are basic functions for which there also exist versions that are safe inside alignments. These safe versions are defined in the `l3prg` module.

```

1417 \tex_global:D \tex_let:D \scan_stop:      \tex_relax:D
1418 \tex_global:D \tex_let:D \group_begin:    \tex_begingroup:D
1419 \tex_global:D \tex_let:D \group_end:      \tex_endgroup:D

```

(End of definition for `\scan_stop:`, `\group_begin:`, and `\group_end:`. These functions are documented on page 14.)

```

1420 <@@=int>

```

`\if_int_compare:w` For integers.

```

1421 \tex_global:D \tex_let:D \if_int_compare:w \tex_ifnum:D
1422 \tex_global:D \tex_let:D \__int_to_roman:w \tex_romannumeral:D

```

(End of definition for `\if_int_compare:w` and `\__int_to_roman:w`. This function is documented on page 186.)

`\group_insert_after:N` Adding material after the end of a group.

```

1423 \tex_global:D \tex_let:D \group_insert_after:N \tex_aftergroup:D

```

(End of definition for `\group_insert_after:N`. This function is documented on page 15.)

`\exp_args:Nc` Discussed in `l3expan`, but needed much earlier.

```

1424 \tex_long:D \tex_gdef:D \exp_args:Nc #1#2
1425 { \exp_after:wN #1 \cs:w #2 \cs_end: }
1426 \tex_long:D \tex_gdef:D \exp_args:cc #1#2
1427 { \cs:w #1 \exp_after:wN \cs_end: \cs:w #2 \cs_end: }

```

(End of definition for `\exp_args:Nc` and `\exp_args:cc`. These functions are documented on page 37.)

`\token_to_meaning:c` A small number of variants defined by hand. Some of the necessary functions (`\use_i:nn`, `\use_ii:nn`, and `\exp_args:Nnc`) are not defined at that point yet, but will be defined before those variants are used. The `\cs_meaning:c` command must check for an undefined control sequence to avoid defining it mistakenly.

```

1428 \tex_gdef:D \token_to_str:c { \exp_args:Nc \token_to_str:N }
1429 \tex_long:D \tex_gdef:D \cs_meaning:c #1
1430 {
1431   \if_cs_exist:w #1 \cs_end:
1432     \exp_after:wN \use_i:nn
1433   \else:
1434     \exp_after:wN \use_ii:nn
1435   \fi:
1436   { \exp_args:Nc \cs_meaning:N {#1} }
1437   { \tl_to_str:n {undefined} }
1438 }
1439 \tex_global:D \tex_let:D \token_to_meaning:c = \cs_meaning:c

```

(End of definition for `\token_to_meaning:N`. This function is documented on page 207.)

## 45.2 Defining some constants

`\c_zero_int` We need the constant `\c_zero_int` which is used by some functions in current module. The rest are defined in the `l3int` module – at least for the ones that can be defined with `\tex_chardef:D` or `\tex_mathchardef:D`. For other constants the `l3int` module is required but it can’t be used until the allocation has been set up properly!

```

1440 \tex_global:D \tex_chardef:D \c_zero_int = 0 ~

```

(End of definition for `\c_zero_int`. This variable is documented on page 184.)

`\c_max_register_int` This is here as this particular integer is needed in modules loaded before `l3int`, and is documented in `l3int`. LuaTeX and those which contain parts of the Omega extensions have more registers available than  $\varepsilon$ -TeX.

```

1441 \tex_ifdefined:D \tex_luatexversion:D
1442   \tex_global:D \tex_chardef:D \c_max_register_int = 65 535 ~
1443 \tex_else:D
1444   \tex_ifdefined:D \tex_omathchardef:D
1445     \tex_global:D \tex_omathchardef:D \c_max_register_int = 65535 ~
1446   \tex_else:D
1447     \tex_global:D \tex_mathchardef:D \c_max_register_int = 32767 ~
1448   \tex_fi:D
1449 \tex_fi:D

```

(End of definition for `\c_max_register_int`. This variable is documented on page 185.)

## 45.3 Defining functions

We start by providing functions for the typical definition functions. First the global ones.

`\cs_gset_nopar:Npn` All assignment functions in L<sup>A</sup>T<sub>E</sub>X<sub>3</sub> should be naturally protected; after all, the T<sub>E</sub>X primitives for assignments are and it can be a cause of problems if others aren’t.

```

\cs_gset_nopar:Npe
\cs_gset_nopar:Npx
\cs_gset:Npn
\cs_gset:Npe
\cs_gset:Npx
1450 \tex_global:D \tex_let:D \cs_gset_nopar:Npn \tex_gdef:D
1451 \tex_global:D \tex_let:D \cs_gset_nopar:Npe \tex_xdef:D

```

```

\cs_gset_protected_nopar:Npn
\cs_gset_protected_nopar:Npe
\cs_gset_protected_nopar:Npx
\cs_gset_protected:Npn
\cs_gset_protected:Npe
\cs_gset_protected:Npx

```

```

1452 \tex_global:D \tex_let:D \cs_gset_nopar:Npx \tex_xdef:D
1453 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset:Npn
1454 { \tex_long:D \tex_gdef:D }
1455 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset:Npe
1456 { \tex_long:D \tex_xdef:D }
1457 \tex_global:D \tex_let:D \cs_gset:Npx \cs_gset:Npe
1458 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset_protected_nopar:Npn
1459 { \tex_protected:D \tex_gdef:D }
1460 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset_protected_nopar:Npe
1461 { \tex_protected:D \tex_xdef:D }
1462 \tex_global:D \tex_let:D \cs_gset_protected_nopar:Npx \cs_gset_protected_nopar:Npe
1463 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset_protected:Npn
1464 { \tex_protected:D \tex_long:D \tex_gdef:D }
1465 \tex_protected:D \tex_long:D \tex_gdef:D \cs_gset_protected:Npe
1466 { \tex_protected:D \tex_long:D \tex_xdef:D }
1467 \tex_global:D \tex_let:D \cs_gset_protected:Npx \cs_gset_protected:Npe

```

(End of definition for `\cs_gset_nopar:Npn` and others. These functions are documented on page 18.)

`\cs_set_nopar:Npn` Local versions of the above functions.

```

\cs_set_nopar:Npe
\cs_set_nopar:Npx
\cs_set:Npn
\cs_set:Npe
\cs_set:Npx
\cs_set_protected_nopar:Npn
\cs_set_protected_nopar:Npe
\cs_set_protected_nopar:Npx
\cs_set_protected:Npn
\cs_set_protected:Npe
\cs_set_protected:Npx
1468 \tex_global:D \tex_let:D \cs_set_nopar:Npn \tex_def:D
1469 \tex_global:D \tex_let:D \cs_set_nopar:Npe \tex_edef:D
1470 \tex_global:D \tex_let:D \cs_set_nopar:Npx \tex_edef:D
1471 \cs_gset_protected:Npn \cs_set:Npn
1472 { \tex_long:D \tex_def:D }
1473 \cs_gset_protected:Npn \cs_set:Npe
1474 { \tex_long:D \tex_edef:D }
1475 \tex_global:D \tex_let:D \cs_set:Npx \cs_set:Npe
1476 \cs_gset_protected:Npn \cs_set_protected_nopar:Npn
1477 { \tex_protected:D \tex_def:D }
1478 \cs_gset_protected:Npn \cs_set_protected_nopar:Npe
1479 { \tex_protected:D \tex_edef:D }
1480 \tex_global:D \tex_let:D \cs_set_protected_nopar:Npx \cs_set_protected_nopar:Npe
1481 \cs_gset_protected:Npn \cs_set_protected:Npn
1482 { \tex_protected:D \tex_long:D \tex_def:D }
1483 \cs_gset_protected:Npn \cs_set_protected:Npe
1484 { \tex_protected:D \tex_long:D \tex_edef:D }
1485 \tex_global:D \tex_let:D \cs_set_protected:Npx \cs_set_protected:Npe

```

(End of definition for `\cs_set_nopar:Npn` and others. These functions are documented on page 17.)

## 45.4 Selecting tokens

```

1486 <@@=exp>

```

`\l__exp_tmp_tl` Scratch token list variable for `l3expan`, used by `\use:x`, used in defining conditionals. We don't use `tl` methods because `l3basics` is loaded earlier.

```

1487 \cs_gset_nopar:Npn \l__exp_tmp_tl { }

```

(End of definition for `\l__exp_tmp_tl`.)

`\use:c` This macro grabs its argument and returns a csname from it.

```

1488 \cs_gset:Npn \use:c #1 { \cs:w #1 \cs_end: }

```

(End of definition for `\use:c`. This function is documented on page 22.)

`\use:x` Fully expands its argument and passes it to the input stream. Uses the reserved `\l__exp_tmp_tl` which we’ve set up above.

```

1489 \cs_gset_protected:Npn \use:x #1

```

(End of definition for \use\_i\_delimit\_by\_q\_nil:nw, \use\_i\_delimit\_by\_q\_stop:nw, and \use\_i\_delimit\_by\_q\_recursion\_stop:nw. These functions are documented on page 28.)

## 45.5 Gobbling tokens from input

To gobble tokens from the input we use a standard naming convention: the number of tokens gobbled is given by the number of n's following the : in the name. Although we could define functions to remove ten arguments or more using separate calls of `\use_`  
`\none:nnnnn`, this is very non-intuitive to the programmer who will assume that expanding such a function once takes care of gobbling all the tokens in one go.

<code>\use_none:n</code>	1554	<code>\cs_gset:Npn \use_none:n</code>	<code>#1</code>	<code>{ }</code>
<code>\use_none:nn</code>	1555	<code>\cs_gset:Npn \use_none:nn</code>	<code>#1#2</code>	<code>{ }</code>
<code>\use_none:nnn</code>	1556	<code>\cs_gset:Npn \use_none:nnn</code>	<code>#1#2#3</code>	<code>{ }</code>
<code>\use_none:nnnn</code>	1557	<code>\cs_gset:Npn \use_none:nnnn</code>	<code>#1#2#3#4</code>	<code>{ }</code>
<code>\use_none:nnnnn</code>	1558	<code>\cs_gset:Npn \use_none:nnnnn</code>	<code>#1#2#3#4#5</code>	<code>{ }</code>
<code>\use_none:nnnnnn</code>	1559	<code>\cs_gset:Npn \use_none:nnnnnn</code>	<code>#1#2#3#4#5#6</code>	<code>{ }</code>
<code>\use_none:nnnnnnn</code>	1560	<code>\cs_gset:Npn \use_none:nnnnnnn</code>	<code>#1#2#3#4#5#6#7</code>	<code>{ }</code>
<code>\use_none:nnnnnnnn</code>	1561	<code>\cs_gset:Npn \use_none:nnnnnnnn</code>	<code>#1#2#3#4#5#6#7#8</code>	<code>{ }</code>
<code>\use_none:nnnnnnnnn</code>	1562	<code>\cs_gset:Npn \use_none:nnnnnnnnn</code>	<code>#1#2#3#4#5#6#7#8#9</code>	<code>{ }</code>

(End of definition for `\use none:n` and others. These functions are documented on page 27.)

## 45.6 Debugging and patching later definitions

`\_kernel_if_debug:TF` A more meaningful test of whether debugging is enabled than messing up with guards. We can also more easily change the logic in one place then. This is needed primarily for deprecations.

```
1564 \cs_gset_protected:Npn \__kernel_if_debug:TF #1#2 {#2}
```

(End of definition for `\_kernel_if_debug:TF`.)

```

\debug_on:n
\debug_off:n
Stubs.
1565 \cs_gset_protected:Npn \debug_on:n #1
1566 {
1567     \sys_load_debug:
1568     \cs_if_exist:NT \__debug_all_on:
1569     { \debug_on:n {#1} }
1570 }
1571 \cs_gset_protected:Npn \debug_off:n #1
1572 {
1573     \sys_load_debug:
1574     \cs_if_exist:NT \__debug_all_on:
1575     { \debug_off:n {#1} }
1576 }

```

(End of definition for `\debug_on:n` and `\debug_off:n`. These functions are documented on page 31.)

```
\debug_suspend:
\debug_resume: 1577 \cs_gset_protected:Npn \debug_suspend: { }
1578 \cs_gset_protected:Npn \debug_resume: { }
```

(End of definition for `\debug_suspend:` and `\debug_resume:`. These functions are documented on page 31.)

```

\__kernel_deprecation_code:nn
\g__debug_deprecation_on_tl
\g__debug_deprecation_off_tl

```

Make deprecated commands throw errors if the user requests it. This relies on two token lists, filled up in `l3deprecation`.

```

1579 \cs_gset_nopar:Npn \g__debug_deprecation_on_tl { }
1580 \cs_gset_nopar:Npn \g__debug_deprecation_off_tl { }
1581 \cs_gset_protected:Npn \__kernel_deprecation_code:nn #1#2
1582 {
1583   \tl_gput_right:Nn \g__debug_deprecation_on_tl {#1}
1584   \tl_gput_right:Nn \g__debug_deprecation_off_tl {#2}
1585 }

```

(End of definition for `\__kernel_deprecation_code:nn`, `\g__debug_deprecation_on_tl`, and `\g__debug_deprecation_off_tl`.)

## 45.7 Conditional processing and definitions

```

1586 <@@=prg>

```

Underneath any predicate function (`_p`) or other conditional forms (`TF`, etc.) is a built-in logic saying that it after all of the testing and processing must return the *(state)* this leaves `TeX` in. Therefore, a simple user interface could be something like

```

\if_meaning:w #1#2
  \prg_return_true:
\else:
  \if_meaning:w #1#3
    \prg_return_true:
  \else:
    \prg_return_false:
\fi:
\fi:

```

Usually, a `TeX` programmer would have to insert a number of `\exp_after:wN`s to ensure the state value is returned at exactly the point where the last conditional is finished. However, that obscures the code and forces the `TeX` programmer to prove that he/she knows the  $2^n - 1$  table. We therefore provide the simpler interface.

```

\prg_return_true:
\prg_return_false:

```

The idea here is that `\exp:w` expands fully any `\else:` and `\fi:` that are waiting to be discarded, before reaching the `\exp_end:` which leaves an empty expansion. The code can then leave either the first or second argument in the input stream. This means that all of the branching code has to contain at least two tokens: see how the logical tests are actually implemented to see this.

```

1587 \cs_gset:Npn \prg_return_true:
1588 { \exp_after:wN \use_i:nn \exp:w }
1589 \cs_gset:Npn \prg_return_false:
1590 { \exp_after:wN \use_ii:nn \exp:w }

```

An extended state space could be implemented by including a more elaborate function in place of `\use_i:nn`/`\use_ii:nn`. Provided two arguments are absorbed then the code would work.

(End of definition for `\prg_return_true:` and `\prg_return_false:`. These functions are documented on page 66.)

```

_prg_use_none_delimit_by_q_recursion_stop:w Private version of \use_none_delimit_by_q_recursion_stop:w.
1591 \cs_gset:Npn \__prg_use_none_delimit_by_q_recursion_stop:w
1592   #1 \q__prg_recursion_stop { }

```

(End of definition for \\_\_prg\_use\_none\_delimit\_by\_q\_recursion\_stop:w.)

**\prg\_set\_conditional:Npnn** The user functions for the types using parameter text from the programmer. The various functions only differ by which function is used for the assignment. For those **Npnn** type functions, we must grab the parameter text, reading everything up to a left brace before continuing. Then split the base function into name and signature, and feed  $\{\langle name \rangle\}$   $\{\langle signature \rangle\}$   $\langle boolean \rangle$   $\{\langle set \text{ or } new \rangle\}$   $\{\langle maybe \text{ protected} \rangle\}$   $\{\langle parameters \rangle\}$   $\{\text{TF}, \dots\}$   $\{\langle code \rangle\}$  to the auxiliary function responsible for defining all conditionals. Note that **e** stands for expandable and **p** for protected.

```

\prg_gset_conditional:Npnn
\prg_new_conditional:Npnn

1603 \cs_gset_protected:Npn \prg_new_protected_conditional:Npnn
1604   { \__prg_generate_conditional_parm:NNNpnn \cs_new_protected:Npn p }
1605 \cs_gset_protected:Npn \__prg_generate_conditional_parm:NNNpnn #1#2#3#4#
1606   {
1607     \use:e
1608     {
1609       \__prg_generate_conditional:nnNNNnnn
1610       \cs_split_function:N #3
1611     }
1612     #1 #2 {#4}
1613   }

```

(End of definition for **\prg\_set\_conditional:Npnn** and others. These functions are documented on page 65.)

**\prg\_set\_conditional:Nnn** The user functions for the types automatically inserting the correct parameter text based on the signature. The various functions only differ by which function is used for the assignment. Split the base function into name and signature. The second auxiliary generates the parameter text from the number of letters in the signature. Then feed  $\{\langle name \rangle\}$   $\{\langle signature \rangle\}$   $\langle boolean \rangle$   $\{\langle set \text{ or } new \rangle\}$   $\{\langle maybe \text{ protected} \rangle\}$   $\{\langle parameters \rangle\}$   $\{\text{TF}, \dots\}$   $\{\langle code \rangle\}$  to the auxiliary function responsible for defining all conditionals. If the  $\langle signature \rangle$  has more than 9 letters, the definition is aborted since T<sub>E</sub>X macros have at most 9 arguments. The erroneous case where the function name contains no colon is captured later.

```

```

\__prg_generate_conditional:nnNNNnn
\__prg_generate_conditional:NNnnnnNw
\__prg_generate_conditional_test:w
\__prg_generate_conditional_fast:nw

```

The workhorse here is going through a list of desired forms, i.e., p, TF, T and F. The first three arguments come from splitting up the base form of the conditional, which gives the name, signature and a boolean to signal whether or not there was a colon in the name. In the absence of a colon, we throw an error and don't define any conditional. The fourth and fifth arguments build up the defining function. The sixth is the parameters to use (possibly empty), the seventh is the list of forms to define, the eighth is the replacement text which we will augment when defining the forms. The use of `\tl_to_str:n` makes the later loop more robust.

A large number of our low-level conditionals look like `\prg_return_true:\else:\prg_return_false:\fi:` so we optimize this special case by calling `\__prg_generate_conditional_fast:nw {<code>}`. This passes `\use_i:nn` instead of `\use_i_ii:nnn` to functions such as `\__prg_generate_p_form:wNNnnnnN`.

```

Looping through the list of desired forms. First are six arguments and seventh is the form. Use the form to call the correct type. If the form does not exist, the `\use:c` construction results in `\relax`, and the error message is displayed (unless the form is empty, to allow for `{T, , F}`), then `\use_none:nnnnnnnn` cleans up. Otherwise, the error message is removed by the variant form.

How to generate the various forms. Those functions take the following arguments: 1: junk, 2: `\cs_set:Npn` or similar, 3: `p` (for protected conditionals) or `e`, 4: function name, 5: signature, 6: parameter text, 7: replacement (possibly trimmed by `\__prg_generate_conditional_fast:nw`), 8: `\use_i_ii:nnn` or `\use_i:nn` (for “fast” conditionals). Remember that the logic-returning functions expect two arguments to be present after `\exp_end::` notice the construction of the different variants relies on this, and that the TF and F variants will be slightly faster than the T version. The `p` form is only valid for expandable tests, we check for that by making sure that the second argument is empty. For “fast” conditionals, #7 has an extra `\if_...`. To optimize a bit further we don’t use `\exp_after:wN \use_ii:nnn` and similar but instead use `\__prg_TF_true:w` and similar to swap out the macro after `\fi:`. It would be a tiny bit faster if we directly

grabbed the T and F arguments there, but if those are actually missing, the recovery from the runaway argument would not insert `\fi`: back, messing up nesting of conditionals.

Split the function to be defined, and setup a manual clist loop over argument #6 of the first auxiliary. The second auxiliary receives twice three arguments coming from splitting the function to be defined and the function to copy. Make sure that both functions contained a colon, otherwise we don't know how to build conditionals, hence abort. Call the looping macro, with arguments  $\{\langle name_1 \rangle\} \{\langle signature_1 \rangle\} \{\langle name_2 \rangle\} \{\langle signature_2 \rangle\}$   $\langle copying\ function \rangle$  and followed by the comma list. At each step in the loop, make sure that the conditional form we copy is defined, and copy it, otherwise abort.

(End of definition for `\__prg_set_eq_conditional:nnNnnNNw` and others.)

All that is left is to define the canonical boolean true and false. I think Michael originated the idea of expandable boolean tests. At first these were supposed to expand into either TT or TF to be tested using `\if:w` but this was later changed to 00 and 01, so they could be used in logical operations. Later again they were changed to being numerical constants with values of 1 for true and 0 for false. We need this from the get-go.

`\c_true_bool` Here are the canonical boolean values.

`\c_false_bool`

```

1794 \tex_global:D \tex_chardef:D \c_true_bool = 1 ~
1795 \tex_global:D \tex_chardef:D \c_false_bool = 0 ~

```

(End of definition for `\c_true_bool` and `\c_false_bool`. These variables are documented on page 69.)

## 45.8 Dissecting a control sequence

```

1796 <@@=cs>

```

---

`\__cs_count_signature:N` ★ `\__cs_count_signature:N` *<function>*

---

Splits the *<function>* into the *<name>* (i.e., the part before the colon) and the *<signature>* (i.e., after the colon). The *<number>* of tokens in the *<signature>* is then left in the input stream. If there was no *<signature>* then the result is the marker value -1.

---

`\__cs_tmp:w` Function used for various short-term usages, for instance defining functions whose definition involves tokens which are hard to insert normally (spaces, characters with category other).

`\cs_to_str:N` This converts a control sequence into the character string of its name, removing the leading escape character. This turns out to be a non-trivial matter as there are different cases:

`\__cs_to_str:N`

`\__cs_to_str:w`

- The usual case of a printable escape character;
- the case of a non-printable escape characters, e.g., when the value of the `\escapechar` is negative;

- when the escape character is a space.

One approach to solve this is to test how many tokens result from `\token_to_str:N \a`. If there are two tokens, then the escape character is printable, while if it is non-printable then only one is present.

However, there is an additional complication: the control sequence itself may start with a space. Clearly that should *not* be lost in the process of converting to a string. So the approach adopted is a little more intricate still. When the escape character is printable, `\token_to_str:N\_\_` yields the escape character itself and a space. The character codes are different, thus the `\if:w` test is false, and TeX reads `\__cs_to_str:N` after turning the following control sequence into a string; this auxiliary removes the escape character, and stops the expansion of the initial `\tex_romannumeral:D`. The second case is that the escape character is not printable. Then the `\if:w` test is unfinished after reading a the space from `\token_to_str:N\_\_`, and the auxiliary `\__cs_to_str:w` is expanded, feeding – as a second character for the test; the test is false, and TeX skips to `\fi:`, then performs `\token_to_str:N`, and stops the `\tex_romannumeral:D` with `\c_zero_int`. The last case is that the escape character is itself a space. In this case, the `\if:w` test is true, and the auxiliary `\__cs_to_str:w` comes into play, inserting `-\int_value:w`, which expands `\c_zero_int` to the character 0. The initial `\tex_romannumeral:D` then sees 0, which is not a terminated number, followed by the escape character, a space, which is removed, terminating the expansion of `\tex_romannumeral:D`. In all three cases, `\cs_to_str:N` takes two expansion steps to be fully expanded.

```
1797 \cs_gset:Npn \cs_to_str:N
1798 {
```

We implement the expansion scheme using `\tex_romannumeral:D` terminating it with `\c_zero_int` rather than using `\exp:w` and `\exp_end:` as we normally do. The reason is that the code heavily depends on terminating the expansion with `\c_zero_int` so we make this dependency explicit.

```
1799 \tex_romannumeral:D
1800 \if:w \token_to_str:N \__cs_to_str:w \fi:
1801 \exp_after:wN \__cs_to_str:N \token_to_str:N
1802 }
1803 \cs_gset:Npn \__cs_to_str:N #1 { \c_zero_int }
1804 \cs_gset:Npn \__cs_to_str:w #1 \__cs_to_str:N
1805 { - \int_value:w \fi: \exp_after:wN \c_zero_int }
```

If speed is a concern we could use `\csstring` in LuaTeX. For the empty csname that primitive gives an empty result while the current `\cs_to_str:N` gives incorrect results in all engines (this is impossible to fix without huge performance hit).

*(End of definition for `\cs_to_str:N`, `\__cs_to_str:N`, and `\__cs_to_str:w`. This function is documented on page 23.)*

**`\cs_split_function:N`**

This function takes a function name and splits it into name with the escape char removed and argument specification. In addition to this, a third argument, a boolean `<true>` or `<false>` is returned with `<true>` for when there is a colon in the function and `<false>` if there is not.

First ensure that we actually get a properly evaluated string by expanding `\cs_to_str:N` twice. If the function contained a colon, the auxiliary takes as #1 the function name, delimited by the first colon, then the signature #2, delimited by `\s__cs_mark`, then `\c_true_bool` as #3, and #4 cleans up until `\s__cs_stop`. Otherwise, the #1 contains the function name and `\s__cs_mark \c_true_bool`, #2 is empty, #3 is `\c_false_bool`,

and #4 cleans up. The second auxiliary trims the trailing `\s__cs_mark` from the function name if present (that is, if the original function had no colon).

```

1806 \cs_gset_protected:Npn \__cs_tmp:w #1
1807 {

```

(End of definition for `\cs_split_function:N`, `\__cs_split_function_auxi:w`, and `\__cs_split_function_auxii:w`. This function is documented on page 23.)

## 45.9 Exist or free

A control sequence is said to *exist* (to be used) if it has an entry in the hash table and its meaning is different from the primitive `\relax` token. A control sequence is said to be *free* (to be defined) if it does not already exist.

<pre> \cs_if_exist_p:N \cs_if_exist_p:c \cs_if_exist:NTF \cs_if_exist:cTF __cs_if_exist_c_aux: __cs_if_exist_c_aux:w </pre>	<p>Two versions for checking existence. For the <code>N</code> form we firstly check for <code>\scan_stop:</code> and then if it is in the hash table. There is no problem when inputting something like <code>\else:</code> or <code>\fi:</code> as TeX will only ever skip input in case the token tested against is <code>\scan_stop:</code>.</p> <p>In both the <code>N</code> and <code>c</code> form we use the way <code>\prg_set_conditional:Npnn</code> optimizes the conditionals to negate the tests using <code>\else:</code> (the <code>\else:</code> in the top level functions will be removed by the optimization, and this usage of <code>\else:</code> will be fine).</p>
---	---

```

1822 \prg_gset_conditional:Npnn \cs_if_exist:N #1 { p , T , F , TF }
1823 {
1824   \if_meaning:w #1 \scan_stop:
1825   \use_i:nnnn
1826   \else:
1827   \fi:
1828   \if_cs_exist:N #1
1829   \prg_return_true:
1830   \else:
1831   \prg_return_false:
1832   \fi:
1833 }

```

For the `c` form we firstly check if it is in the hash table and then for `\scan_stop:` so that we do not add it to the hash table unless it was already there. Here we have to be careful as the text to be skipped if the first test is false may contain tokens that disturb the scanner. Therefore, we ensure that the second test is performed after the first one has concluded completely.

(End of definition for `\cs_if_exist_use:NTF`, `\__cs_if_exist_use_aux:w`, and `\__cs_if_exist_use_aux:Nnn`. This function is documented on page [22](#).)

## 45.10 Preliminaries for new functions

We provide two kinds of functions that can be used to define control sequences. On the one hand we have functions that check if their argument doesn't already exist, they are called `\..._new`. The second type of defining functions doesn't check if the argument is already defined.

Before we can define them, we need some auxiliary macros that allow us to generate error messages. The next few definitions here are only temporary, they will be redefined later on.

`\msg_error:nnee` If an internal error occurs before L<sup>A</sup>T<sub>E</sub>X3 has loaded l3msg then the code should issue a  
`\msg_error:nne` usable if terse error message and halt. This can only happen if a coding error is made by  
`\msg_error:nn` the team, so this is a reasonable response. Setting the `\newlinechar` is needed, to turn  
`^^J` into a proper line break in plain T<sub>E</sub>X.

```

1952 \cs_gset_protected:Npn \msg_error:nnee #1#2#3#4
1953 {
1954     \tex_newlinechar:D = '\^^J \scan_stop:
1955     \tex_errmessage:D
1956     {
1957         !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!~! ^^J
1958         Argh,~internal~LaTeX3~error! ^^J ^^J
1959         Module ~ #1 , ~ message~name~"#2": ^^J
1960         Arguments~'#3'~and~'#4' ^^J ^^J
1961         This~is~one~for~The~LaTeX3~Project:~bailing~out
1962     }
1963     \tex_end:D
1964 }

```

```

1965 \cs_gset_protected:Npn \msg_error:nne #1#2#3
1966 { \msg_error:nnee {#1} {#2} {#3} { } }
1967 \cs_gset_protected:Npn \msg_error:nn #1#2
1968 { \msg_error:nnee {#1} {#2} { } { } }

```

(End of definition for \msg\_error:nnnn. This function is documented on page 87.)

**\msg\_line\_context:** Another one from l3msg which will be altered later.

```

1969 \cs_gset:Npn \msg_line_context:
1970 { on~line~ \tex_the:D \tex_inputlineno:D }

```

(End of definition for \msg\_line\_context:. This function is documented on page 85.)

**\iow\_log:e** We define a routine to write only to the log file. And a similar one for writing to both  
**\iow\_term:e** the log file and the terminal. These will be redefined later by l3file.

```

1971 \cs_gset_protected:Npn \iow_log:e
1972 { \tex_immediate:D \tex_write:D -1 }
1973 \cs_gset_protected:Npn \iow_term:e
1974 { \tex_immediate:D \tex_write:D 16 }

```

(End of definition for \iow\_log:n. This function is documented on page 99.)

**\\_\_kernel\_chk\_if\_free\_cs:N** This command is called by \cs\_new\_nopar:Npn and \cs\_new\_eq:NN etc. to make sure  
**\\_\_kernel\_chk\_if\_free\_cs:c** that the argument sequence is not already in use. If it is, an error is signalled. It checks  
if <csname> is undefined or \scan\_stop:. Otherwise an error message is issued. We have  
to make sure we don't put the argument into the conditional processing since it may be  
an \if... type function!

```

1975 \cs_gset_protected:Npn \__kernel_chk_if_free_cs:N #1
1976 {
1977   \cs_if_free:NF #1
1978   {
1979     \msg_error:nnee { kernel } { command-already-defined }
1980     { \token_to_str:N #1 } { \token_to_meaning:N #1 }
1981   }
1982 }
1983 \cs_gset_protected:Npn \__kernel_chk_if_free_cs:c
1984 { \exp_args:Nc \__kernel_chk_if_free_cs:N }

```

(End of definition for \\_\_kernel\_chk\_if\_free\_cs:N.)

## 45.11 Defining new functions

```

1985 <@@=cs>

```

**\cs\_new\_nopar:Npn** Function which check that the control sequence is free before defining it.

**\cs\_new\_nopar:Npe** 1986 \cs\_set:Npn \\_\_cs\_tmp:w #1#2

**\cs\_new\_nopar:Npx** 1987 {

**\cs\_new:Npn** 1988 \cs\_gset\_protected:Npn #1 ##1

**\cs\_new:Npe** 1989 {

**\cs\_new:Npx** 1990 \\_\_kernel\_chk\_if\_free\_cs:N ##1

**\cs\_new\_protected\_nopar:Npn** 1991 #2 ##1

**\cs\_new\_protected\_nopar:Npe** 1992 }

**\cs\_new\_protected\_nopar:Npx** 1993 }

1994 \\_\_cs\_tmp:w \cs\_new\_nopar:Npn

\cs\_gset\_nopar:Npn

**\cs\_new\_protected:Npn**

**\cs\_new\_protected:Npe**

**\cs\_new\_protected:Npx**

\\_\_cs\_tmp:w

```

1995 \__cs_tmp:w \cs_new_nopar:Npe \cs_gset_nopar:Npe
1996 \__cs_tmp:w \cs_new_nopar:Npx \cs_gset_nopar:Npx
1997 \__cs_tmp:w \cs_new:Npn \cs_gset:Npn
1998 \__cs_tmp:w \cs_new:Npe \cs_gset:Npe
1999 \__cs_tmp:w \cs_new:Npx \cs_gset:Npx
2000 \__cs_tmp:w \cs_new_protected_nopar:Npn \cs_gset_protected_nopar:Npn
2001 \__cs_tmp:w \cs_new_protected_nopar:Npe \cs_gset_protected_nopar:Npe
2002 \__cs_tmp:w \cs_new_protected_nopar:Npx \cs_gset_protected_nopar:Npx
2003 \__cs_tmp:w \cs_new_protected:Npn \cs_gset_protected:Npn
2004 \__cs_tmp:w \cs_new_protected:Npe \cs_gset_protected:Npe
2005 \__cs_tmp:w \cs_new_protected:Npx \cs_gset_protected:Npx

```

(End of definition for `\cs_new_nopar:Npn` and others. These functions are documented on page 16.)

`\cs_set_nopar:cpn` Like `\cs_set_nopar:Npn` and `\cs_new_nopar:Npn`, except that the first argument consists of the sequence of characters that should be used to form the name of the desired control sequence (the `c` stands for csname argument, see the expansion module). Global versions are also provided.

`\cs_gset_nopar:cpe` `\cs_set_nopar:cpn` $\langle string \rangle$  $\langle rep-text \rangle$  turns  $\langle string \rangle$  into a csname and then assigns  $\langle rep-text \rangle$  to it by using `\cs_set_nopar:Npn`. This means that there might be a parameter string between the two arguments.

```

\cs_new_nopar:cpn
\cs_new_nopar:cpe
\cs_new_nopar:cpx
2006 \cs_set:Npn \__cs_tmp:w #1#2
2007 { \cs_new_protected_nopar:Npn #1 { \exp_args:Nc #2 } }
2008 \__cs_tmp:w \cs_set_nopar:cpn \cs_set_nopar:Npn
2009 \__cs_tmp:w \cs_set_nopar:cpe \cs_set_nopar:Npe
2010 \__cs_tmp:w \cs_set_nopar:cpx \cs_set_nopar:Npx
2011 \__cs_tmp:w \cs_gset_nopar:cpn \cs_gset_nopar:Npn
2012 \__cs_tmp:w \cs_gset_nopar:cpe \cs_gset_nopar:Npe
2013 \__cs_tmp:w \cs_gset_nopar:cpx \cs_gset_nopar:Npx
2014 \__cs_tmp:w \cs_new_nopar:cpn \cs_new_nopar:Npn
2015 \__cs_tmp:w \cs_new_nopar:cpe \cs_new_nopar:Npe
2016 \__cs_tmp:w \cs_new_nopar:cpx \cs_new_nopar:Npx

```

(End of definition for `\cs_set_nopar:Npn`. This function is documented on page 17.)

`\cs_set:cpn` Variants of the `\cs_set:Npn` versions which make a csname out of the first arguments.  
`\cs_set:cpe` We may also do this globally.

```

\cs_set:cpx
2017 \__cs_tmp:w \cs_set:cpn \cs_set:Npn
\cs_gset:cpn
2018 \__cs_tmp:w \cs_set:cpe \cs_set:Npe
\cs_gset:cpe
2019 \__cs_tmp:w \cs_set:cpx \cs_set:Npx
\cs_gset:cpx
2020 \__cs_tmp:w \cs_gset:cpn \cs_gset:Npn
\cs_new:cpn
2021 \__cs_tmp:w \cs_gset:cpe \cs_gset:Npe
\cs_new:cpe
2022 \__cs_tmp:w \cs_gset:cpx \cs_gset:Npx
\cs_new:cpx
2023 \__cs_tmp:w \cs_new:cpn \cs_new:Npn
2024 \__cs_tmp:w \cs_new:cpe \cs_new:Npe
2025 \__cs_tmp:w \cs_new:cpx \cs_new:Npx

```

(End of definition for `\cs_set:Npn`. This function is documented on page 17.)

`\cs_set_protected_nopar:cpn` Variants of the `\cs_set_protected_nopar:Npn` versions which make a csname out of the first arguments. We may also do this globally.

```

\cs_set_protected_nopar:cpe
\cs_set_protected_nopar:cpx
2026 \__cs_tmp:w \cs_set_protected_nopar:cpn \cs_set_protected_nopar:Npn
\cs_gset_protected_nopar:cpn
2027 \__cs_tmp:w \cs_set_protected_nopar:cpe \cs_set_protected_nopar:Npe
\cs_gset_protected_nopar:cpe
2028 \__cs_tmp:w \cs_set_protected_nopar:cpx \cs_set_protected_nopar:Npx
\cs_gset_protected_nopar:cpx
\cs_new_protected_nopar:cpn
\cs_new_protected_nopar:cpe
\cs_new_protected_nopar:cpx

```

```

2029 \__cs_tmp:w \cs_gset_protected_nopar:cpn \cs_gset_protected_nopar:Npn
2030 \__cs_tmp:w \cs_gset_protected_nopar:cpe \cs_gset_protected_nopar:Npe
2031 \__cs_tmp:w \cs_gset_protected_nopar:cpx \cs_gset_protected_nopar:Npx
2032 \__cs_tmp:w \cs_new_protected_nopar:cpn \cs_new_protected_nopar:Npn
2033 \__cs_tmp:w \cs_new_protected_nopar:cpe \cs_new_protected_nopar:Npe
2034 \__cs_tmp:w \cs_new_protected_nopar:cpx \cs_new_protected_nopar:Npx

```

(End of definition for `\cs_set_protected_nopar:Npn`. This function is documented on page 17.)

`\cs_set_protected:cpn` Variants of the `\cs_set_protected:Npn` versions which make a csname out of the first arguments. We may also do this globally.

```

\cs_set_protected:cpe
\cs_set_protected:cpx
\cs_gset_protected:cpn
\cs_gset_protected:cpe
\cs_gset_protected:cpx
\cs_new_protected:cpn
\cs_new_protected:cpe
\cs_new_protected:cpx
2035 \__cs_tmp:w \cs_set_protected:cpn \cs_set_protected:Npn
2036 \__cs_tmp:w \cs_set_protected:cpe \cs_set_protected:Npe
2037 \__cs_tmp:w \cs_set_protected:cpx \cs_set_protected:Npx
2038 \__cs_tmp:w \cs_gset_protected:cpn \cs_gset_protected:Npn
2039 \__cs_tmp:w \cs_gset_protected:cpe \cs_gset_protected:Npe
2040 \__cs_tmp:w \cs_gset_protected:cpx \cs_gset_protected:Npx
2041 \__cs_tmp:w \cs_new_protected:cpn \cs_new_protected:Npn
2042 \__cs_tmp:w \cs_new_protected:cpe \cs_new_protected:Npe
2043 \__cs_tmp:w \cs_new_protected:cpx \cs_new_protected:Npx

```

(End of definition for `\cs_set_protected:Npn`. This function is documented on page 17.)

## 45.12 Copying definitions

`\cs_set_eq:NN` These macros allow us to copy the definition of a control sequence to another control sequence.

`\cs_set_eq:cN` The = sign allows us to define funny char tokens like = itself or `\_` with this function.

`\cs_set_eq:Nc` For the definition of `\c_space_char{~}` to work we need the ~ after the =.

`\cs_set_eq:cc` `\cs_set_eq:NN` is long to avoid problems with a literal argument of `\par`. While `\cs_new_eq:NN` will probably never be correct with a first argument of `\par`, define it long in order to throw an “already defined” error rather than “runaway argument”.

```

\cs_gset_eq:NN
\cs_gset_eq:cN
\cs_gset_eq:Nc
\cs_gset_eq:cc
\cs_new_eq:NN
\cs_new_eq:cN
\cs_new_eq:Nc
\cs_new_eq:cc
2044 \cs_new_protected:Npn \cs_set_eq:NN #1 { \tex_let:D #1 =~ }
2045 \cs_new_protected:Npn \cs_set_eq:cN { \exp_args:Nc \cs_set_eq:NN }
2046 \cs_new_protected:Npn \cs_set_eq:Nc { \exp_args:NNc \cs_set_eq:NN }
2047 \cs_new_protected:Npn \cs_set_eq:cc { \exp_args:Ncc \cs_set_eq:NN }
2048 \cs_new_protected:Npn \cs_gset_eq:NN { \tex_global:D \cs_set_eq:NN }
2049 \cs_new_protected:Npn \cs_gset_eq:Nc { \exp_args:NNc \cs_gset_eq:NN }
2050 \cs_new_protected:Npn \cs_gset_eq:cN { \exp_args:Nc \cs_gset_eq:NN }
2051 \cs_new_protected:Npn \cs_gset_eq:cc { \exp_args:Ncc \cs_gset_eq:NN }
2052 \cs_new_protected:Npn \cs_new_eq:NN #1
2053 {
2054   \__kernel_chk_if_free_cs:N #1
2055   \tex_global:D \cs_set_eq:NN #1
2056 }
2057 \cs_new_protected:Npn \cs_new_eq:cN { \exp_args:Nc \cs_new_eq:NN }
2058 \cs_new_protected:Npn \cs_new_eq:Nc { \exp_args:NNc \cs_new_eq:NN }
2059 \cs_new_protected:Npn \cs_new_eq:cc { \exp_args:Ncc \cs_new_eq:NN }

```

(End of definition for `\cs_set_eq:NN`, `\cs_gset_eq:NN`, and `\cs_new_eq:NN`. These functions are documented on page 21.)

## 45.13 Undefining functions

`\cs_undefine:N` The following function is used to free the main memory from the definition of some function that isn't in use any longer. The `c` variant is careful not to add the control sequence to the hash table if it isn't there yet, and it also avoids nesting `\TeX` conditionals in case `#1` is unbalanced in this matter. We optimize the case where the command exists by reducing as much as possible the tokens in the conditional.

```

2060 \cs_new_protected:Npn \cs_undefine:N #1
2061 { \cs_gset_eq:NN #1 \tex_undefined:D }
2062 \cs_new_protected:Npn \cs_undefine:c #1
2063 {
2064   \if_cs_exist:w #1 \cs_end:
2065   \else:
2066     \use_i:nnnn
2067   \fi:
2068   \exp_args:Nc \cs_undefine:N {#1}
2069 }
```

(End of definition for `\cs_undefine:N`. This function is documented on page 21.)

## 45.14 Generating parameter text from argument count

```

2070 <@@=cs>
```

```

\_kernel_cs_parm_from_arg_count:nnF
\_cs_parm_from_arg_count_test:nnF
```

`\TeX`3 provides shorthands to define control sequences and conditionals with a simple parameter text, derived directly from the signature, or more generally from knowing the number of arguments, between 0 and 9. This function expands to its first argument, untouched, followed by a brace group containing the parameter text `{#1...#n}`, where  $n$  is the result of evaluating the second argument (as described in `\int_eval:n`). If the second argument gives a result outside the range  $[0, 9]$ , the third argument is returned instead, normally an error message. Some of the functions use here are not defined yet, but will be defined before this function is called.

```

2071 \cs_new_protected:Npn \_kernel_cs_parm_from_arg_count:nnF #1#2
2072 {
2073   \exp_args:Ne \_cs_parm_from_arg_count_test:nnF
2074   {
2075     \exp_after:wN \exp_not:n
2076     \if_case:w \int_eval:n {#2}
2077       { }
2078       \or: { ##1 }
2079       \or: { ##1##2 }
2080       \or: { ##1##2##3 }
2081       \or: { ##1##2##3##4 }
2082       \or: { ##1##2##3##4##5 }
2083       \or: { ##1##2##3##4##5##6 }
2084       \or: { ##1##2##3##4##5##6##7 }
2085       \or: { ##1##2##3##4##5##6##7##8 }
2086       \or: { ##1##2##3##4##5##6##7##8##9 }
2087       \else: { \c_false_bool }
2088     \fi:
2089   }
2090   {#1}
```

```

2091 }
2092 \cs_new_protected:Npn \__cs_parm_from_arg_count_test:nnF #1#2
2093 {
2094   \if_meaning:w \c_false_bool #1
2095     \exp_after:wN \use_ii:nn
2096   \else:
2097     \exp_after:wN \use_i:nn
2098   \fi:
2099   { #2 {#1} }
2100 }

```

(End of definition for `\__kernel_cs_parm_from_arg_count:nnF` and `\__cs_parm_from_arg_count_test:nnF`.)

## 45.15 Defining functions from a given number of arguments

```

2101 <@@=cs>

```

`\__cs_count_signature:N` Counting the number of tokens in the signature, i.e., the number of arguments the function should take. Since this is not used in any time-critical function, we simply use `\tl_count:n` if there is a signature, otherwise `-1` arguments to signal an error. We need a variant form right away.

```

2102 \cs_new:Npn \__cs_count_signature:N #1
2103 { \exp_args:Nf \__cs_count_signature:n { \cs_split_function:N #1 } }
2104 \cs_new:Npn \__cs_count_signature:n #1
2105 { \int_eval:n { \__cs_count_signature:nnN #1 } }
2106 \cs_new:Npn \__cs_count_signature:nnN #1#2#3
2107 {
2108   \if_meaning:w \c_true_bool #3
2109     \tl_count:n {#2}
2110   \else:
2111     -1
2112   \fi:
2113 }
2114 \cs_new:Npn \__cs_count_signature:c
2115 { \exp_args:Nc \__cs_count_signature:N }

```

(End of definition for `\__cs_count_signature:N`, `\__cs_count_signature:n`, and `\__cs_count_signature:nnN`.)

```

\cs_generate_from_arg_count:NNnn
\cs_generate_from_arg_count:cNnn
\cs_generate_from_arg_count:Ncnn

```

We provide a constructor function for defining functions with a given number of arguments. For this we need to choose the correct parameter text and then use that when defining. Since T<sub>E</sub>X supports from zero to nine arguments, we use a simple switch to choose the correct parameter text, ensuring the result is returned after finishing the conditional. If it is not between zero and nine, we throw an error.

1: function to define, 2: with what to define it, 3: the number of args it requires and 4: the replacement text

```

2116 \cs_new_protected:Npn \cs_generate_from_arg_count:NNnn #1#2#3#4
2117 {
2118   \__kernel_cs_parm_from_arg_count:nnF { \use:nnn #2 #1 } {#3}
2119   {
2120     \msg_error:nnee { kernel } { bad-number-of-arguments }
2121     { \token_to_str:N #1 } { \int_eval:n {#3} }

```

```

2122         \use_none:n
2123     }
2124     {#4}
2125 }

```

A variant form we need right away, plus one which is used elsewhere but which is most logically created here.

```

2126 \cs_new_protected:Npn \cs_generate_from_arg_count:cNnn
2127 { \exp_args:Nc \cs_generate_from_arg_count:NNnn }
2128 \cs_new_protected:Npn \cs_generate_from_arg_count:Ncnn
2129 { \exp_args:NNc \cs_generate_from_arg_count:NNnn }

```

(End of definition for `\cs_generate_from_arg_count:NNnn`. This function is documented on page 20.)

## 45.16 Using the signature to define functions

```

2130 <@@=cs>

```

We can now combine some of the tools we have to provide a simple interface for defining functions, where the number of arguments is read from the signature. For instance, `\cs_set:Nn \foo_bar:nn {#1,#2}`.

We want to define `\cs_set:Nn` as

```

\cs_set:Nn
\cs_set:Ne
\cs_set:Nx
\cs_set_nopar:Nn
\cs_set_nopar:Ne
\cs_set_nopar:Nx
\cs_set_protected:Nn
\cs_set_protected:Ne
\cs_set_protected:Nx
\cs_set_protected_nopar:Nn
\cs_set_protected_nopar:Ne
\cs_set_protected_nopar:Nx

```

```

\cs_set_protected:Npn \cs_set:Nn #1#2
{
  \cs_generate_from_arg_count:NNnn #1 \cs_set:Npn
  { \@@_count_signature:N #1 } {#2}
}

```

In short, to define `\cs_set:Nn` we need just use `\cs_set:Npn`, everything else is the same for each variant. Therefore, we can make it simpler by temporarily defining a function to do this for us.

```

2131 \cs_set:Npn \__cs_tmp:w #1#2#3
2132 {
2133   \cs_new_protected:cpx { cs_ #1 : #2 }
2134   {
2135     \exp_not:N \__cs_generate_from_signature:NNn
2136     \exp_after:wN \exp_not:N \cs:w cs_ #1 : #3 \cs_end:
2137   }
2138 }
2139 \cs_new_protected:Npn \__cs_generate_from_signature:NNn #1#2
2140 {
2141   \use:e
2142   {
2143     \__cs_generate_from_signature:nnNNNn
2144     \cs_split_function:N #2
2145   }
2146   #1 #2
2147 }
2148 \cs_new_protected:Npn \__cs_generate_from_signature:nnNNNn #1#2#3#4#5#6
2149 {
2150   \bool_if:NTF #3
2151   {
2152     \cs_set_nopar:Npx \__cs_tmp:w

```

```

2153         { \tl_map_function:nN {#2} \__cs_generate_from_signature:n }
2154 \tl_if_empty:oF \__cs_tmp:w
2155     {
2156         \msg_error:nneee { kernel } { non-base-function }
2157         { \token_to_str:N #5 } {#2} { \__cs_tmp:w }
2158     }
2159 \cs_generate_from_arg_count:NNnn
2160 #5 #4 { \tl_count:n {#2} } {#6}
2161 }
2162 {
2163     \msg_error:nne { kernel } { missing-colon }
2164     { \token_to_str:N #5 }
2165 }
2166 }
2167 \cs_new:Npn \__cs_generate_from_signature:n #1
2168 {
2169     \if:w n #1 \else: \if:w N #1 \else:
2170     \if:w T #1 \else: \if:w F #1 \else: #1 \fi: \fi: \fi: \fi:
2171 }

```

Then we define the 24 variants beginning with N.

```

2172 \__cs_tmp:w { set } { Nn } { Npn }
2173 \__cs_tmp:w { set } { Ne } { Npe }
2174 \__cs_tmp:w { set } { Nx } { Npx }
2175 \__cs_tmp:w { set_nopar } { Nn } { Npn }
2176 \__cs_tmp:w { set_nopar } { Ne } { Npe }
2177 \__cs_tmp:w { set_nopar } { Nx } { Npx }
2178 \__cs_tmp:w { set_protected } { Nn } { Npn }
2179 \__cs_tmp:w { set_protected } { Ne } { Npe }
2180 \__cs_tmp:w { set_protected } { Nx } { Npx }
2181 \__cs_tmp:w { set_protected_nopar } { Nn } { Npn }
2182 \__cs_tmp:w { set_protected_nopar } { Ne } { Npe }
2183 \__cs_tmp:w { set_protected_nopar } { Nx } { Npx }
2184 \__cs_tmp:w { gset } { Nn } { Npn }
2185 \__cs_tmp:w { gset } { Ne } { Npe }
2186 \__cs_tmp:w { gset } { Nx } { Npx }
2187 \__cs_tmp:w { gset_nopar } { Nn } { Npn }
2188 \__cs_tmp:w { gset_nopar } { Ne } { Npe }
2189 \__cs_tmp:w { gset_nopar } { Nx } { Npx }
2190 \__cs_tmp:w { gset_protected } { Nn } { Npn }
2191 \__cs_tmp:w { gset_protected } { Ne } { Npe }
2192 \__cs_tmp:w { gset_protected } { Nx } { Npx }
2193 \__cs_tmp:w { gset_protected_nopar } { Nn } { Npn }
2194 \__cs_tmp:w { gset_protected_nopar } { Ne } { Npe }
2195 \__cs_tmp:w { gset_protected_nopar } { Nx } { Npx }
2196 \__cs_tmp:w { new } { Nn } { Npn }
2197 \__cs_tmp:w { new } { Ne } { Npe }
2198 \__cs_tmp:w { new } { Nx } { Npx }
2199 \__cs_tmp:w { new_nopar } { Nn } { Npn }
2200 \__cs_tmp:w { new_nopar } { Ne } { Npe }
2201 \__cs_tmp:w { new_nopar } { Nx } { Npx }
2202 \__cs_tmp:w { new_protected } { Nn } { Npn }
2203 \__cs_tmp:w { new_protected } { Ne } { Npe }
2204 \__cs_tmp:w { new_protected } { Nx } { Npx }
2205 \__cs_tmp:w { new_protected_nopar } { Nn } { Npn }

```

```

2206 \__cs_tmp:w { new_protected_nopar } { Ne } { Npe }
2207 \__cs_tmp:w { new_protected_nopar } { Nx } { Npx }

```

(End of definition for \cs\_set:Nn and others. These functions are documented on page 19.)

\cs\_set:cn The 24 c variants simply use \exp\_args:Nc.

\cs_if_eq:ccTF 2266 \cs_new:Npn \cs_if_eq:ccTF { \exp_args:Ncc \cs_if_eq:NNTF }
\cs_if_eq:ccT 2267 \cs_new:Npn \cs_if_eq:ccT { \exp_args:Ncc \cs_if_eq:NNT }
\cs_if_eq:ccF 2268 \cs_new:Npn \cs_if_eq:ccF { \exp_args:Ncc \cs_if_eq:NNF }

```

(End of definition for \cs\_if\_eq:NNTF. This function is documented on page 29.)

## 45.18 Diagnostic functions

```

2269 <@@=kernel>
\__kernel_chk_defined:NT Error if the variable #1 is not defined.
2270 \cs_new_protected:Npn \__kernel_chk_defined:NT #1#2
2271 {
2272 \cs_if_exist:NTF #1
2273 {#2}
2274 {
2275 \msg_error:nne { kernel } { variable-not-defined }
2276 { \token_to_str:N #1 }
2277 }
2278 }

```

(End of definition for \\_\_kernel\_chk\_defined:NT.)

\\_\_kernel\_register\_show:N Simply using the \showthe primitive does not allow for line-wrapping, so instead use \tl\_show:n and \tl\_log:n (defined in l3tl and that performs line-wrapping). This displays >~<variable>=<value>. We expand the value before-hand as otherwise some integers (such as \currentgrouplevel or \currentgrouptype) altered by the line-wrapping code would show wrong values.

```

\__kernel_register_show:N 2279 \cs_new_protected:Npn \__kernel_register_show:N
\__kernel_register_show:c 2280 { \__kernel_register_show_aux:NN \tl_show:n }
\__kernel_register_log:N 2281 \cs_new_protected:Npn \__kernel_register_show:c
\__kernel_register_log:c 2282 { \exp_args:Nc \__kernel_register_show:N }
\__kernel_register_log:c 2283 \cs_new_protected:Npn \__kernel_register_log:N
\__kernel_register_log:c 2284 { \__kernel_register_show_aux:NN \tl_log:n }
\__kernel_register_log:c 2285 \cs_new_protected:Npn \__kernel_register_log:c
\__kernel_register_log:c 2286 { \exp_args:Nc \__kernel_register_log:N }

```

```

2287 \cs_new_protected:Npn \__kernel_register_show_aux:NN #1#2
2288 {
2289   \__kernel_chk_defined:NT #2
2290   {
2291     \exp_args:No \__kernel_register_show_aux:nNN
2292     { \tex_the:D #2 } #2 #1
2293   }
2294 }
2295 \cs_new_protected:Npn \__kernel_register_show_aux:nNN #1#2#3
2296 { \exp_args:No #3 { \token_to_str:N #2 = #1 } }

```

(End of definition for \\_\_kernel\_register\_show:N and others.)

**\cs\_show:N** Some control sequences have a very long name or meaning. Thus, simply using TeX's  
**\cs\_show:c** primitive `\show` could lead to overlong lines. The output of this primitive is mimicked  
**\cs\_log:N** to some extent, then the re-built string is given to `\tl_show:n` or `\tl_log:n` for line-  
**\cs\_log:c** wrapping. We must expand the meaning before passing it to the wrapping code as  
**\\_\_kernel\_show:NN** otherwise we would wrongly see the definitions that are in place there. To get correct  
 escape characters, set the `\escapechar` in a group; this also localizes the assignment  
 performed by e-expansion. The `\cs_show:c` and `\cs_log:c` commands convert their  
 argument to a control sequence within a group to avoid showing `\relax` for undefined  
 control sequences.

```

2297 \cs_new_protected:Npn \cs_show:N { \__kernel_show:NN \tl_show:n }
2298 \cs_new_protected:Npn \cs_show:c
2299 { \group_begin: \exp_args:NNc \group_end: \cs_show:N }
2300 \cs_new_protected:Npn \cs_log:N { \__kernel_show:NN \tl_log:n }
2301 \cs_new_protected:Npn \cs_log:c
2302 { \group_begin: \exp_args:NNc \group_end: \cs_log:N }
2303 \cs_new_protected:Npn \__kernel_show:NN #1#2
2304 {
2305   \group_begin:
2306   \int_set:Nn \tex_escapechar:D { '\ }
2307   \exp_args:NNe
2308   \group_end:
2309   #1 { \token_to_str:N #2 = \cs_meaning:N #2 }
2310 }

```

(End of definition for `\cs_show:N`, `\cs_log:N`, and `\__kernel_show:NN`. These functions are documented on page 21.)

**\group\_show\_list:** Wrapper around `\showgroups`. Getting TeX to write to the log without interruption the  
**\group\_log\_list:** run is done by altering the interaction mode.  
**\\_\_kernel\_group\_show:NN**

```

2311 \cs_new_protected:Npn \group_show_list:
2312 { \__kernel_group_show:NN \use_none:n 1 }
2313 \cs_new_protected:Npn \group_log_list:
2314 { \__kernel_group_show:NN \int_gzero:N 0 }
2315 \cs_new_protected:Npn \__kernel_group_show:NN #1#2
2316 {
2317   \use:e
2318   {
2319     #1 \tex_interactionmode:D
2320     \int_set:Nn \tex_tracingonline:D {#2}
2321     \int_set:Nn \tex_errorcontextlines:D { -1 }
2322     \exp_not:N \exp_after:wN \scan_stop:

```

```

2323     \tex_showgroups:D
2324     \int_gset:Nn \tex_interactionmode:D
2325     { \int_use:N \tex_interactionmode:D }
2326     \int_set:Nn \tex_tracingonline:D
2327     { \int_use:N \tex_tracingonline:D }
2328     \int_set:Nn \tex_errorcontextlines:D
2329     { \int_use:N \tex_errorcontextlines:D }
2330   }
2331 }

```

(End of definition for `\group_show_list:`, `\group_log_list:`, and `\__kernel_group_show:NN`. These functions are documented on page 15.)

## 45.19 Decomposing a macro definition

```

\cs_prefix_spec:N
\cs_parameter_spec:N
\cs_replacement_spec:N
\__kernel_prefix_arg_replacement:wN

```

We sometimes want to test if a control sequence can be expanded to reveal a hidden value. However, we cannot just expand the macro blindly as it may have arguments and none might be present. Therefore we define these functions to pick either the prefix(es), the parameter specification, or the replacement text from a macro. All of this information is returned as characters with catcode 12. If the token in question isn't a macro, the token `\scan_stop:` is returned instead.

```

2332 \use:e
2333 {
2334   \exp_not:n { \cs_new:Npn \__kernel_prefix_arg_replacement:wN #1 }
2335   \tl_to_str:n { macro : } \exp_not:n { #2 -> #3 \s__kernel_stop #4 }
2336 }
2337 { #4 {#1} {#2} {#3} }
2338 \cs_new:Npn \cs_prefix_spec:N #1
2339 {
2340   \token_if_macro:NTF #1
2341   {
2342     \exp_after:wN \__kernel_prefix_arg_replacement:wN
2343     \token_to_meaning:N #1 \s__kernel_stop \use_i:nnn
2344   }
2345   { \scan_stop: }
2346 }
2347 \cs_new:Npn \cs_parameter_spec:N #1
2348 {
2349   \token_if_macro:NTF #1
2350   {
2351     \exp_after:wN \__kernel_prefix_arg_replacement:wN
2352     \token_to_meaning:N #1 \s__kernel_stop \use_ii:nnn
2353   }
2354   { \scan_stop: }
2355 }
2356 \cs_new:Npn \cs_replacement_spec:N #1
2357 {
2358   \token_if_macro:NTF #1
2359   {
2360     \exp_after:wN \__kernel_prefix_arg_replacement:wN
2361     \token_to_meaning:N #1 \s__kernel_stop \use_iii:nnn
2362   }
2363   { \scan_stop: }

```

2364 }

(End of definition for `\cs_prefix_spec:N` and others. These functions are documented on page 23.)

## 45.20 Doing nothing functions

`\prg_do_nothing:` This does not fit anywhere else!

2365 `\cs_new:Npn \prg_do_nothing: { }`

(End of definition for `\prg_do_nothing:`. This function is documented on page 14.)

## 45.21 Breaking out of mapping functions

2366 `<@@=prg>`

`\prg_break_point:Nn` In inline mappings, the nesting level must be reset at the end of the mapping, even when the user decides to break out. This is done by putting the code that must be performed as an argument of `\__prg_break_point:Nn`. The breaking functions are then defined to jump to that point and perform the argument of `\__prg_break_point:Nn`, before the user's code (if any). There is a check that we close the correct loop, otherwise we continue breaking.

2367 `\cs_new_eq:NN \prg_break_point:Nn \use_ii:nn`  
 2368 `\cs_new:Npn \prg_map_break:Nn #1#2#3 \prg_break_point:Nn #4#5`  
 2369 `{`  
 2370 `#5`  
 2371 `\if_meaning:w #1 #4`  
 2372 `\exp_after:wN \use_iii:nnn`  
 2373 `\fi:`  
 2374 `\prg_map_break:Nn #1 {#2}`  
 2375 `}`

(End of definition for `\prg_break_point:Nn` and `\prg_map_break:Nn`. These functions are documented on page 74.)

`\prg_break_point:` Very simple analogues of `\prg_break_point:Nn` and `\prg_map_break:Nn`, for use in fast short-term recursions which are not mappings, do not need to support nesting, and in which nothing has to be done at the end of the loop.

2376 `\cs_new_eq:NN \prg_break_point: \prg_do_nothing:`  
 2377 `\cs_new:Npn \prg_break: #1 \prg_break_point: { }`  
 2378 `\cs_new:Npn \prg_break:n #1#2 \prg_break_point: {#1}`

(End of definition for `\prg_break_point:`, `\prg_break:`, and `\prg_break:n`. These functions are documented on page 75.)

## 45.22 Starting a paragraph

`\mode_leave_vertical:` The approach here is different to that used by L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> or plain T<sub>E</sub>X, which unbox a void box to force horizontal mode. That inserts the `\everypar` tokens *before* the re-inserted unboxing tokens. The approach here uses a protected macro, equivalent to the `\quitvmode` primitive. In vertical mode, the `\indent` primitive is inserted: this will switch to horizontal mode and insert `\everypar` tokens and nothing else. Unlike the

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> version, the availability of  $\epsilon$ -T<sub>E</sub>X means using a mode test can be done at for example the start of an `\halign`.

```
2379 \cs_new_protected:Npn \mode_leave_vertical:
2380 {
2381   \if_mode_vertical:
2382     \exp_after:wN \tex_indent:D
2383   \fi:
2384 }
```

*(End of definition for `\mode_leave_vertical`:. This function is documented on page [31](#).)*

```
2385 \</code>
```

## Chapter 46

# l3expan implementation

```
2386 \def\exp_after:wN {  
2387 \exp_not:N  
2388 \exp_not:n  
2389 }  
2390 \def\exp_after:wN {  
2391 \exp_not:N  
2392 \exp_not:n  
2393 }  
2394 \def\exp_after:wN {  
2395 \exp_not:N  
2396 \exp_not:n  
2397 }
```

The `\exp_` module has its private variable to temporarily store the result of `x`-type argument expansion. This is done to avoid interference with other functions using temporary variables.

(End of definition for `\l__exp_tmp_tl`.)

These are defined in `l3basics`, as they are needed “early”. This is just a reminder of that fact!

(End of definition for `\exp_after:wN`, `\exp_not:N`, and `\exp_not:n`. These functions are documented on page 41.)

### 46.1 General expansion

In this section a general mechanism for defining functions that handle arguments is defined. These general expansion functions are expandable unless `x` is used. (Any version of `x` is going to have to use one of the L<sup>A</sup>T<sub>E</sub>X3 names for `\cs_set:Npx` at some point, and so is never going to be expandable.)

The definition of expansion functions with this technique happens in section 46.7. In section 46.2 some common cases are coded by a more direct method for efficiency, typically using calls to `\exp_after:wN`.

```
\l__exp_tmp_tl This scratch token list variable is defined in l3basics.  
(End of definition for \l__exp_tmp_tl.)
```

This code uses internal functions with names that start with `\:` to perform the expansions. All macros are `long` since the tokens undergoing expansion may be arbitrary user input.

An argument manipulator `\:⟨Z⟩` always has signature `#1\:::#2#3` where `#1` holds the remaining argument manipulations to be performed, `\:::` serves as an end marker for the list of manipulations, `#2` is the carried over result of the previous expansion steps and `#3` is the argument about to be processed. One exception to this rule is `\:p`, which has to grab an argument delimited by a left brace.

`\_exp_arg_next:nnn` #1 is the result of an expansion step, #2 is the remaining argument manipulations and  
`\_exp_arg_next:Nnn` #3 is the current result of the expansion chain. This auxiliary function moves #1 back  
after #3 in the input stream and checks if any expansion is left to be done by calling  
#2. In by far the most cases we need to add a set of braces to the result of an argument  
manipulation so it is more effective to do it directly here. Actually, so far only the `c` of  
the final argument manipulation variants does not require a set of braces.

```
2388 \cs_new:Npn \_exp_arg_next:nnn #1#2#3 { #2 \::: { #3 {#1} } }
2389 \cs_new:Npn \_exp_arg_next:Nnn #1#2#3 { #2 \::: { #3 #1 } }
```

(End of definition for `\_exp_arg_next:nnn` and `\_exp_arg_next:Nnn`.)

**`\:::`** The end marker is just another name for the identity function.

```
2390 \cs_new:Npn \::: #1 {#1}
```

(End of definition for `\:::`. This function is documented on page 44.)

**`\::n`** This function is used to skip an argument that doesn't need to be expanded.

```
2391 \cs_new:Npn \::n #1 \::: #2#3 { #1 \::: { #2 {#3} } }
```

(End of definition for `\::n`. This function is documented on page 44.)

**`\::N`** This function is used to skip an argument that consists of a single token and doesn't need  
to be expanded.

```
2392 \cs_new:Npn \::N #1 \::: #2#3 { #1 \::: {#2#3} }
```

(End of definition for `\::N`. This function is documented on page 44.)

**`\::p`** This function is used to skip an argument that is delimited by a left brace and doesn't  
need to be expanded. It is not wrapped in braces in the result.

```
2393 \cs_new:Npn \::p #1 \::: #2#3# { #1 \::: {#2#3} }
```

(End of definition for `\::p`. This function is documented on page 44.)

**`\::c`** This function is used to skip an argument that is turned into a control sequence without  
expansion.

```
2394 \cs_new:Npn \::c #1 \::: #2#3
2395 { \exp_after:wN \_exp_arg_next:Nnn \cs:w #3 \cs_end: {#1} {#2} }
```

(End of definition for `\::c`. This function is documented on page 44.)

**`\::o`** This function is used to expand an argument once.

```
2396 \cs_new:Npn \::o #1 \::: #2#3
2397 { \exp_after:wN \_exp_arg_next:nnn \exp_after:wN {#3} {#1} {#2} }
```

(End of definition for `\::o`. This function is documented on page 44.)

**`\::e`** With the `\expanded` primitive available, just expand.

```
2398 \cs_new:Npn \::e #1 \::: #2#3
2399 { \tex_expanded:D { \exp_not:n { #1 \::: } { \exp_not:n {#2} {#3} } } }
```

(End of definition for `\::e`. This function is documented on page 44.)

**\::f** This function is used to expand a token list until the first unexpandable token is found. This is achieved through `\exp:w \exp_end_continue_f:w` that expands everything in its way following it. This scanning procedure is terminated once the expansion hits something non-expandable (if that is a space it is removed). We introduce `\exp_stop_f:` to mark such an end-of-expansion marker. For example, `f`-expanding `\cs_set_eq:Nc \aaa { b \l_tmpa_tl b }` where `\l_tmpa_tl` contains the characters `lur` gives `\tex_let:D \aaa = \blurb` which then turns out to start with the non-expandable token `\tex_let:D`. Since the expansion of `\exp:w \exp_end_continue_f:w` is empty, we wind up with a fully expanded list, only TeX has not tried to execute any of the non-expandable tokens. This is what differentiates this function from the `e` and `x` argument type.

```

2400 \cs_new:Npn \::f #1 \::: #2#3
2401 {
2402   \exp_after:wN \__exp_arg_next:nnn
2403   \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2404   {#1} {#2}
2405 }
2406 \use:nn { \cs_new_eq:NN \exp_stop_f: } { ~ }
```

(End of definition for `\::f` and `\exp_stop_f:`. These functions are documented on page 44.)

**\::x** This function is used to expand an argument fully. We build in the expansion of `\__exp_arg_next:nnn`.

```

2407 \cs_new_protected:Npn \::x #1 \::: #2#3
2408 {
2409   \cs_set_nopar:Npe \l__exp_tmp_tl
2410   { \exp_not:n { #1 \::: } { \exp_not:n {#2} {#3} } }
2411   \l__exp_tmp_tl
2412 }
```

(End of definition for `\::x`. This function is documented on page 44.)

**\::v** These functions return the value of a register, i.e., one of `tl`, `clist`, `int`, `skip`, `dim`, **`\::V`** `muskip`, or built-in TeX register. The `V` version expects a single token whereas `v` like `c` creates a csname from its argument given in braces and then evaluates it as if it was a `V`. The `\exp:w` sets off an expansion similar to an `f`-type expansion, which we terminate using `\exp_end:`. The argument is returned in braces.

```

2413 \cs_new:Npn \::V #1 \::: #2#3
2414 {
2415   \exp_after:wN \__exp_arg_next:nnn
2416   \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
2417   {#1} {#2}
2418 }
2419 \cs_new:Npn \::v #1 \::: #2#3
2420 {
2421   \exp_after:wN \__exp_arg_next:nnn
2422   \exp_after:wN { \exp:w \__exp_eval_register:c {#3} }
2423   {#1} {#2}
2424 }
```

(End of definition for `\::v` and `\::V`. These functions are documented on page 44.)

`\__exp_eval_register:N` This function evaluates a register. Now a register might exist as one of two things: A parameter-less macro or a built-in TeX register such as `\count`. For the TeX registers we have to utilize a `\the` whereas for the macros we merely have to expand them once. The trick is to find out when to use `\the` and when not to. What we want here is to find out whether the token expands to something else when hit with `\exp_after:wN`. The technique is to compare the meaning of the token in question when it has been prefixed with `\exp_not:N` and the token itself. If it is a macro, the prefixed `\exp_not:N` temporarily turns it into the primitive `\scan_stop:.`

```

2425 \cs_new:Npn \__exp_eval_register:N #1
2426 {
2427     \exp_after:wN \if_meaning:w \exp_not:N #1 #1

```

If the token was not a macro it may be a malformed variable from a `c` expansion in which case it is equal to the primitive `\scan_stop:.` In that case we throw an error. We could let TeX do it for us but that would result in the rather obscure

! You can't use '`\relax`' after `\the`.

which while quite true doesn't give many hints as to what actually went wrong. We provide something more sensible.

```

2428     \if_meaning:w \scan_stop: #1
2429     \__exp_eval_error_msg:w
2430     \fi:

```

The next bit requires some explanation. The function must be initiated by `\exp:w` and we want to terminate this expansion chain by inserting the `\exp_end:` token. However, we have to expand the register `#1` before we do that. If it is a TeX register, we need to execute the sequence `\exp_after:wN \exp_end: \tex_the:D #1` and if it is a macro we need to execute `\exp_after:wN \exp_end: #1`. We therefore issue the longer of the two sequences and if the register is a macro, we remove the `\tex_the:D`.

```

2431     \else:
2432         \exp_after:wN \use_i_ii:nnn
2433     \fi:
2434     \exp_after:wN \exp_end: \tex_the:D #1
2435 }
2436 \cs_new:Npn \__exp_eval_register:c #1
2437 { \exp_after:wN \__exp_eval_register:N \cs:w #1 \cs_end: }

```

Clean up nicely, then call the undefined control sequence. The result is an error message looking like this:

```

! Undefined control sequence.
<argument> \LaTeX3 error:
                               Erroneous variable used!
1.55 \tl_set:Nv \l_tmpa_tl {undefined_tl}

```

```

2438 \cs_new:Npn \__exp_eval_error_msg:w #1 \tex_the:D #2
2439 {
2440     \fi:
2441     \fi:
2442     \msg_expandable_error:nnn { kernel } { bad-variable } {#2}
2443     \exp_end:
2444 }

```

*(End of definition for `\__exp_eval_register:N` and `\__exp_eval_error_msg:w`.)*

## 46.2 Hand-tuned definitions

One of the most important features of these functions is that they are fully expandable.

`\exp_args:Nc` In l3basics.

`\exp_args:cc`

*(End of definition for `\exp_args:Nc` and `\exp_args:cc`. These functions are documented on page 37.)*

`\exp_args:NNc`

`\exp_args:Ncc`

`\exp_args:Nccc`

Here are the functions that turn their argument into csnames but are expandable.

```
2445 \cs_new:Npn \exp_args:NNc #1#2#3
2446 { \exp_after:wN #1 \exp_after:wN #2 \cs:w # 3\cs_end: }
2447 \cs_new:Npn \exp_args:Ncc #1#2#3
2448 { \exp_after:wN #1 \cs:w #2 \exp_after:wN \cs_end: \cs:w #3 \cs_end: }
2449 \cs_new:Npn \exp_args:Nccc #1#2#3#4
2450 {
2451   \exp_after:wN #1
2452   \cs:w #2 \exp_after:wN \cs_end:
2453   \cs:w #3 \exp_after:wN \cs_end:
2454   \cs:w #4 \cs_end:
2455 }
```

*(End of definition for `\exp_args:NNc`, `\exp_args:Ncc`, and `\exp_args:Nccc`. These functions are documented on page 38.)*

`\exp_args:No`

`\exp_args:NNo`

`\exp_args:NNNo`

Those lovely runs of expansion!

```
2456 \cs_new:Npn \exp_args:No #1#2 { \exp_after:wN #1 \exp_after:wN {#2} }
2457 \cs_new:Npn \exp_args:NNo #1#2#3
2458 { \exp_after:wN #1 \exp_after:wN #2 \exp_after:wN {#3} }
2459 \cs_new:Npn \exp_args:NNNo #1#2#3#4
2460 { \exp_after:wN #1 \exp_after:wN#2 \exp_after:wN #3 \exp_after:wN {#4} }
```

*(End of definition for `\exp_args:No`, `\exp_args:NNo`, and `\exp_args:NNNo`. These functions are documented on page 37.)*

`\exp_args:Ne`

When the `\expanded` primitive is available, use it.

```
2461 \cs_new:Npn \exp_args:Ne #1#2
2462 { \exp_after:wN #1 \tex_expanded:D { {#2} } }
```

*(End of definition for `\exp_args:Ne`. This function is documented on page 37.)*

`\exp_args:Nf`

`\exp_args:NV`

`\exp_args:Nv`

```
2463 \cs_new:Npn \exp_args:Nf #1#2
2464 { \exp_after:wN #1 \exp_after:wN { \exp:w \exp_end_continue_f:w #2 } }
2465 \cs_new:Npn \exp_args:Nv #1#2
2466 {
2467   \exp_after:wN #1 \exp_after:wN
2468   { \exp:w \__exp_eval_register:c {#2} }
2469 }
2470 \cs_new:Npn \exp_args:NV #1#2
2471 {
2472   \exp_after:wN #1 \exp_after:wN
2473   { \exp:w \__exp_eval_register:N #2 }
2474 }
```

*(End of definition for `\exp_args:Nf`, `\exp_args:Nv`, and `\exp_args:Nv`. These functions are documented on page 37.)*

`\exp_args:NNV` Some more hand-tuned function with three arguments. If we forced that an `o` argument always has braces, we could implement `\exp_args:Nco` with less tokens and only two arguments.

```

2475 \cs_new:Npn \exp_args:NNV #1#2#3
2476 {
2477   \exp_after:wN #1
2478   \exp_after:wN #2
2479   \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
2480 }
2481 \cs_new:Npn \exp_args:NNv #1#2#3
2482 {
2483   \exp_after:wN #1
2484   \exp_after:wN #2
2485   \exp_after:wN { \exp:w \__exp_eval_register:c {#3} }
2486 }
2487 \cs_new:Npn \exp_args:NNe #1#2#3
2488 {
2489   \exp_after:wN #1
2490   \exp_after:wN #2
2491   \tex_expanded:D { {#3} }
2492 }
2493 \cs_new:Npn \exp_args:NNf #1#2#3
2494 {
2495   \exp_after:wN #1
2496   \exp_after:wN #2
2497   \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2498 }
2499 \cs_new:Npn \exp_args:Nco #1#2#3
2500 {
2501   \exp_after:wN #1
2502   \cs:w #2 \exp_after:wN \cs_end:
2503   \exp_after:wN {#3}
2504 }
2505 \cs_new:Npn \exp_args:NcV #1#2#3
2506 {
2507   \exp_after:wN #1
2508   \cs:w #2 \exp_after:wN \cs_end:
2509   \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
2510 }
2511 \cs_new:Npn \exp_args:Ncv #1#2#3
2512 {
2513   \exp_after:wN #1
2514   \cs:w #2 \exp_after:wN \cs_end:
2515   \exp_after:wN { \exp:w \__exp_eval_register:c {#3} }
2516 }
2517 \cs_new:Npn \exp_args:Ncf #1#2#3
2518 {
2519   \exp_after:wN #1
2520   \cs:w #2 \exp_after:wN \cs_end:
2521   \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2522 }
2523 \cs_new:Npn \exp_args:NVV #1#2#3
2524 {
2525   \exp_after:wN #1

```

```

2526 \exp_after:wN { \exp:w \exp_after:wN
2527   \__exp_eval_register:N \exp_after:wN #2 \exp_after:wN }
2528 \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
2529 }

```

(End of definition for `\exp_args:NNV` and others. These functions are documented on page 38.)

`\exp_args:NNNV`  
`\exp_args:NNNv`  
`\exp_args:NNNe`  
`\exp_args:NcNc`  
`\exp_args:NcNo`  
`\exp_args:Ncco`

A few more that we can hand-tune.

```

2530 \cs_new:Npn \exp_args:NNNV #1#2#3#4
2531 {
2532   \exp_after:wN #1
2533   \exp_after:wN #2
2534   \exp_after:wN #3
2535   \exp_after:wN { \exp:w \__exp_eval_register:N #4 }
2536 }
2537 \cs_new:Npn \exp_args:NNNv #1#2#3#4
2538 {
2539   \exp_after:wN #1
2540   \exp_after:wN #2
2541   \exp_after:wN #3
2542   \exp_after:wN { \exp:w \__exp_eval_register:c {#4} }
2543 }
2544 \cs_new:Npn \exp_args:NNNe #1#2#3#4
2545 {
2546   \exp_after:wN #1
2547   \exp_after:wN #2
2548   \exp_after:wN #3
2549   \tex_expanded:D { {#4} }
2550 }
2551 \cs_new:Npn \exp_args:NcNc #1#2#3#4
2552 {
2553   \exp_after:wN #1
2554   \cs:w #2 \exp_after:wN \cs_end:
2555   \exp_after:wN #3
2556   \cs:w #4 \cs_end:
2557 }
2558 \cs_new:Npn \exp_args:NcNo #1#2#3#4
2559 {
2560   \exp_after:wN #1
2561   \cs:w #2 \exp_after:wN \cs_end:
2562   \exp_after:wN #3
2563   \exp_after:wN {#4}
2564 }
2565 \cs_new:Npn \exp_args:Ncco #1#2#3#4
2566 {
2567   \exp_after:wN #1
2568   \cs:w #2 \exp_after:wN \cs_end:
2569   \cs:w #3 \exp_after:wN \cs_end:
2570   \exp_after:wN {#4}
2571 }

```

(End of definition for `\exp_args:NNNV` and others. These functions are documented on page 38.)

`\exp_args:Nx`

```

2572 \cs_new_protected:Npn \exp_args:Nx #1#2
2573 { \use:x { \exp_not:N #1 {#2} } }

```

(End of definition for `\exp_args:Nx`. This function is documented on page 37.)

## 46.3 Last-unbraced versions

```

\__exp_arg_last_unbraced:nn
\::o_unbraced
\::V_unbraced
\::v_unbraced
\::e_unbraced
\::f_unbraced
\::x_unbraced

```

There are a few places where the last argument needs to be available unbraced. First some helper macros.

```

2574 \cs_new:Npn \__exp_arg_last_unbraced:nn #1#2 { #2#1 }
2575 \cs_new:Npn \::o_unbraced \::: #1#2

```

(End of definition for `\exp_last_unbraced:No` and others. These functions are documented on page 40.)

`\exp_last_two_unbraced:Noo` If #2 is a single token then this can be implemented as  
`\__exp_last_two_unbraced:noN`

```

\cs_new:Npn \exp_last_two_unbraced:Noo #1 #2 #3
{ \exp_after:wN \exp_after:wN \exp_after:wN #1 \exp_after:wN #2 #3 }

```

However, for robustness this is not suitable. Instead, a bit of a shuffle is used to ensure that #2 can be multiple tokens.

```

2662 \cs_new:Npn \exp_last_two_unbraced:Noo #1#2#3
2663 { \exp_after:wN \__exp_last_two_unbraced:noN \exp_after:wN {#3} {#2} #1 }
2664 \cs_new:Npn \__exp_last_two_unbraced:noN #1#2#3
2665 { \exp_after:wN #3 #2 #1 }

```

(End of definition for `\exp_last_two_unbraced:Noo` and `\__exp_last_two_unbraced:noN`. This function is documented on page 40.)

## 46.4 Preventing expansion

`\__kernel_exp_not:w` At the kernel level, we need the primitive behaviour to allow expansion *before* the brace group.

```

2666 \cs_new_eq:NN \__kernel_exp_not:w \tex_unexpanded:D

```

(End of definition for `\__kernel_exp_not:w`.)

`\exp_not:c` All these except `\exp_not:c` call the kernel-internal `\__kernel_exp_not:w` namely `\tex_unexpanded:D`.

```

2667 \cs_new:Npn \exp_not:c #1 { \exp_after:wN \exp_not:N \cs:w #1 \cs_end: }
2668 \cs_new:Npn \exp_not:o #1 { \__kernel_exp_not:w \exp_after:wN {#1} }
2669 \cs_new:Npn \exp_not:e #1
2670 { \__kernel_exp_not:w \tex_expanded:D { {#1} } }
2671 \cs_new:Npn \exp_not:f #1
2672 { \__kernel_exp_not:w \exp_after:wN { \exp:w \exp_end_continue_f:w #1 } }
2673 \cs_new:Npn \exp_not:V #1
2674 {
2675   \__kernel_exp_not:w \exp_after:wN
2676   { \exp:w \__exp_eval_register:N #1 }
2677 }
2678 \cs_new:Npn \exp_not:v #1
2679 {
2680   \__kernel_exp_not:w \exp_after:wN
2681   { \exp:w \__exp_eval_register:c {#1} }
2682 }

```

(End of definition for `\exp_not:c` and others. These functions are documented on page 41.)

## 46.5 Controlled expansion

`\exp:w` To trigger a sequence of “arbitrarily” many expansions we need a method to invoke TeX’s  
`\exp_end:` expansion mechanism in such a way that (a) we are able to stop it in a controlled manner  
`\exp_end_continue_f:w` and (b) the result of what triggered the expansion in the first place is null, i.e., that we  
`\exp_end_continue_f:nw` do not get any unwanted side effects. There aren’t that many possibilities in TeX; in fact  
the one explained below might well be the only one (as normally the result of expansion is not null).

The trick here is to make use of the fact that `\tex_romannumeral:D` expands the tokens following it when looking for a number and that its expansion is null if that number

turns out to be zero or negative. So we use that to start the expansion sequence: `\exp:w` is set equal to `\tex_romannumeral:D` in `l3basics`. To stop the expansion sequence in a controlled way all we need to provide is a constant integer zero as part of expanded tokens. As this is an integer constant it immediately stops `\tex_romannumeral:D`'s search for a number. Again, the definition of `\exp_end:` as the integer constant zero is in `l3basics`. (Note that according to our specification all tokens we expand initiated by `\exp:w` are supposed to be expandable (as well as their replacement text in the expansion) so we will not encounter a “number” that actually result in a roman numeral being generated. Or if we do then the programmer made a mistake.)

If on the other hand we want to stop the initial expansion sequence but continue with an `f`-type expansion we provide the alphabetic constant `^^@` that also represents 0 but this time TeX's syntax for a `<number>` continues searching for an optional space (and it continues expansion doing that) — see TeXbook page 269 for details.

```
2683 \group_begin:
2684   \tex_catcode:D '^^@ = 13
2685   \cs_new_protected:Npn \exp_end_continue_f:w { '^^@ }
```

If the above definition ever appears outside its proper context the active character `^^@` will be executed so we turn this into an error. The test for existence covers the (unlikely) case that some other code has already defined `^^@`: this is true for example for `xmltex.tex`.

```
2686   \if_cs_exist:N ^^@
2687   \else:
2688     \cs_new:Npn ^^@
2689       { \msg_expandable_error:nn { kernel } { bad-exp-end-f } }
2690   \fi:
```

The same but grabbing an argument to remove spaces and braces.

```
2691   \cs_new:Npn \exp_end_continue_f:nw #1 { '^^@ #1 }
2692 \group_end:
```

*(End of definition for `\exp:w` and others. These functions are documented on page 43.)*

## 46.6 Defining function variants

```
2693 <@@=cs>
```

`\s__cs_mark` Internal scan marks. No l3quark yet, so do things by hand.

```
\s__cs_stop
2694 \cs_new_eq:NN \s__cs_mark \scan_stop:
2695 \cs_new_eq:NN \s__cs_stop \scan_stop:
```

*(End of definition for `\s__cs_mark` and `\s__cs_stop`.)*

`\q__cs_recursion_stop` Internal recursion quarks. No l3quark yet, so do things by hand.

```
2696 \cs_new:Npn \q__cs_recursion_stop { \q__cs_recursion_stop }
```

*(End of definition for `\q__cs_recursion_stop`.)*

`\__cs_use_none_delimit_by_s_stop:w` Internal scan marks.

```
\__cs_use_i_delimit_by_s_stop:nw
__cs_use_none_delimit_by_q_recursion_stop:w
2697 \cs_new:Npn \__cs_use_none_delimit_by_s_stop:w #1 \s__cs_stop { }
2698 \cs_new:Npn \__cs_use_i_delimit_by_s_stop:nw #1 #2 \s__cs_stop {#1}
2699 \cs_new:Npn \__cs_use_none_delimit_by_q_recursion_stop:w
2700   #1 \q__cs_recursion_stop { }
```

(End of definition for `\__cs_use_none_delimit_by_s_stop:w`, `\__cs_use_i_delimit_by_s_stop:nw`, and `\__cs_use_none_delimit_by_q_recursion_stop:w`.)

`\cs_generate_variant:Nn` #1 : Base form of a function; e.g., `\tl_set:Nn`  
`\cs_generate_variant:cn` #2 : One or more variant argument specifiers; e.g., `{Nx,c,cx}`

After making sure that the base form exists, test whether it is protected or not and define `\__cs_tmp:w` as either `\cs_new:Npe` or `\cs_new_protected:Npe`, which is then used to define all the variants (except those involving x-expansion, always protected). Split up the original base function only once, to grab its name and signature. Then we wish to iterate through the comma list of variant argument specifiers, which we first convert to a string: the reason is explained later.

```

2701 \cs_new_protected:Npn \cs_generate_variant:Nn #1#2
2702 {
2703   \__cs_generate_variant:N #1
2704   \use:e
2705   {
2706     \__cs_generate_variant:nnNN
2707     \cs_split_function:N #1
2708     \exp_not:N #1
2709     \tl_to_str:n {#2} ,
2710     \exp_not:N \scan_stop: ,
2711     \exp_not:N \q__cs_recursion_stop
2712   }
2713 }
2714 \cs_new_protected:Npn \cs_generate_variant:cn
2715 { \exp_args:Nc \cs_generate_variant:Nn }
```

(End of definition for `\cs_generate_variant:Nn`. This function is documented on page 34.)

`\__cs_generate_variant:N`  
`\__cs_generate_variant:ww`  
`\__cs_generate_variant:wwNw`

The goal here is to pick up protected parent functions. There are four cases: the parent function can be a primitive or a macro, and can be expandable or not. For non-expandable primitives, all variants should be protected; skipping the `\else:` branch is safe because non-expandable primitives cannot be T<sub>E</sub>X conditionals.

The other case where variants should be protected is when the parent function is a protected macro: then `protected` appears in the meaning before the first occurrence of `macro`. The `ww` auxiliary removes everything in the meaning string after the first `ma`. We use `ma` rather than the full `macro` because the meaning of the `\firstmark` primitive (and four others) can contain an arbitrary string after a leading `firstmark:`. Then, look for `pr` in the part we extracted: no need to look for anything longer: the only strings we can have are an empty string, `\long_`, `\protected_`, `\protected\long_`, `\first`, `\top`, `\bot`, `\splittop`, or `\splitbot`, with `\` replaced by the appropriate escape character. If `pr` appears in the part before `ma`, the first `\s__cs_mark` is taken as an argument of the `wwNw` auxiliary, and #3 is `\cs_new_protected:Npe`, otherwise it is `\cs_new:Npe`.

```

2716 \cs_new_protected:Npe \__cs_generate_variant:N #1
2717 {
2718   \exp_not:N \exp_after:wN \exp_not:N \if_meaning:w
2719   \exp_not:N \exp_not:N #1 #1
2720   \cs_set_eq:NN \exp_not:N \__cs_tmp:w \cs_new_protected:Npe
2721   \exp_not:N \else:
2722   \exp_not:N \exp_after:wN \exp_not:N \__cs_generate_variant:ww
2723   \exp_not:N \token_to_meaning:N #1 \tl_to_str:n { ma }
2724   \s__cs_mark
```

```

2725     \s__cs_mark \cs_new_protected:Npe
2726     \tl_to_str:n { pr }
2727     \s__cs_mark \cs_new:Npe
2728     \s__cs_stop
2729     \exp_not:N \fi:
2730 }
2731 \exp_last_unbraced:NNNNo
2732 \cs_new_protected:Npn \__cs_generate_variant:ww
2733 #1 { \tl_to_str:n { ma } } #2 \s__cs_mark
2734 { \__cs_generate_variant:wwNw #1 }
2735 \exp_last_unbraced:NNNNo
2736 \cs_new_protected:Npn \__cs_generate_variant:wwNw
2737 #1 { \tl_to_str:n { pr } } #2 \s__cs_mark #3 #4 \s__cs_stop
2738 { \cs_set_eq:NN \__cs_tmp:w #3 }

```

(End of definition for `\__cs_generate_variant:N`, `\__cs_generate_variant:ww`, and `\__cs_generate_variant:wwNw`.)

`\__cs_generate_variant:nnNN` #1 : Base name.  
#2 : Base signature.  
#3 : Boolean.  
#4 : Base function.

If the boolean is `\c_false_bool`, the base function has no colon and we abort with an error; otherwise, set off a loop through the desired variant forms. The original function is retained as #4 for efficiency.

```

2739 \cs_new_protected:Npn \__cs_generate_variant:nnNN #1#2#3#4
2740 {
2741     \if_meaning:w \c_false_bool #3
2742     \msg_error:nne { kernel } { missing-colon }
2743     { \token_to_str:c {#1} }
2744     \exp_after:wN \__cs_use_none_delimit_by_q_recursion_stop:w
2745     \fi:
2746     \__cs_generate_variant:Nnnw #4 {#1}{#2}
2747 }

```

(End of definition for `\__cs_generate_variant:nnNN`.)

`\__cs_generate_variant:Nnnw` #1 : Base function.  
#2 : Base name.  
#3 : Base signature.  
#4 : Beginning of variant signature.

First check whether to terminate the loop over variant forms. Then, for each variant form, construct a new function name using the original base name, the variant signature consisting of  $l$  letters and the last  $k - l$  letters of the base signature (of length  $k$ ). For example, for a base function `\prop_put:Nnn` which needs a `cV` variant form, we want the new signature to be `cVn`.

There are further subtleties:

- In `\cs_generate_variant:Nn \foo:nnTF {xxTF}`, we must define `\foo:xxTF` using `\exp_args:Nxx`, rather than a hypothetical `\exp_args:NxxTF`. Thus, we wish to trim a common trailing part from the base signature and the variant signature.
- In `\cs_generate_variant:Nn \foo:on {ox}`, the function `\foo:ox` must be defined using `\exp_args:Nnx`, not `\exp_args:Nox`, to avoid double `o` expansion.

- Lastly, `\cs_generate_variant:Nn \foo:on {xn}` must trigger an error, because we do not have a means to replace o-expansion by x-expansion. More generally, we can only convert N to c, or convert n to V, v, o, e, f, or x.

All this boils down to a few rules. Only n and N-type arguments can be replaced by `\cs_generate_variant:Nn`. Other argument types are allowed to be passed unchanged from the base form to the variant: in the process they are changed to n except for N and p-type arguments. A common trailing part is ignored.

We compare the base and variant signatures one character at a time within e-expansion. The result is given to `\__cs_generate_variant:wwNN` (defined later) in the form `<processed variant signature> \s__cs_mark <errors> \s__cs_stop <base function> <new function>`. If all went well, `<errors>` is empty; otherwise, it is a kernel error message and some clean-up code.

Note the space after #3 and after the following brace group. Those are ignored by  $\text{\TeX}$  when fetching the last argument for `\__cs_generate_variant_loop:nNwN`, but can be used as a delimiter for `\__cs_generate_variant_loop_end:nwwwNNnn`.

```

2748 \cs_new_protected:Npn \__cs_generate_variant:Nnnw #1#2#3#4 ,
2749 {
2750   \if_meaning:w \scan_stop: #4
2751   \exp_after:wN \__cs_use_none_delimit_by_q_recursion_stop:w
2752   \fi:
2753   \use:e
2754   {
2755     \exp_not:N \__cs_generate_variant:wwNN
2756     \__cs_generate_variant_loop:nNwN { }
2757     #4
2758     \__cs_generate_variant_loop_end:nwwwNNnn
2759     \s__cs_mark
2760     #3 ~
2761     { ~ { } \fi: \__cs_generate_variant_loop_long:wNNnn } ~
2762     { }
2763     \s__cs_stop
2764     \exp_not:N #1 {#2} {#4}
2765   }
2766   \__cs_generate_variant:Nnnw #1 {#2} {#3}
2767 }
```

(End of definition for `\__cs_generate_variant:Nnnw`.)

<code>\__cs_generate_variant_loop:nNwN</code>	#1 :	Last few consecutive letters common between the base and variant (more precisely,
<code>\__cs_generate_variant_loop_base:N</code>		<code>\__cs_generate_variant_same:N</code> <i>&lt;letter&gt;</i> for each letter).
<code>\__cs_generate_variant_loop_same:w</code>	#2 :	Next variant letter.
<code>\__cs_generate_variant_loop_end:nwwwNNnn</code>	#3 :	Remainder of variant form.
<code>\__cs_generate_variant_loop_long:wNNnn</code>	#4 :	Next base letter.

The first argument is populated by `\__cs_generate_variant_loop_same:w` when a variant letter and a base letter match. It is flushed into the input stream whenever the two letters are different: if the loop ends before, the argument is dropped, which means that trailing common letters are ignored.

The case where the two letters are different is only allowed if the base is N and the variant is c, or when the base is n and the variant is V, v, o, e, f, or x. Otherwise, call `\__cs_generate_variant_loop_invalid:NNwNNnn` to remove the end of the loop, get arguments at the end of the loop, and place an appropriate error message as a second

argument of `\__cs_generate_variant:wwNN`. If the letters are distinct and the base letter is indeed `n` or `N`, leave in the input stream whatever argument #1 was collected, and the next variant letter #2, then loop by calling `\__cs_generate_variant_loop:nNwN`.

The loop can stop in three ways.

- If the end of the variant form is encountered first, #2 is `\__cs_generate_variant_loop_end:nwwwNNnn` (expanded by the conditional `\if:w`), which inserts some tokens to end the conditional; grabs the `<base name>` as #7, the `<variant signature>` #8, the `<next base letter>` #1 and the part #3 of the base signature that wasn't read yet; and combines those into the `<new function>` to be defined.
- If the end of the base form is encountered first, #4 is `~{} \fi:` which ends the conditional (with an empty expansion), followed by `\__cs_generate_variant_loop_long:wNNnn`, which places an error as the second argument of `\__cs_generate_variant:wwNN`.
- The loop can be interrupted early if the requested expansion is unavailable, namely when the variant and base letters differ and the base is not the right one (`n` or `N` to support the variant). In that case too an error is placed as the second argument of `\__cs_generate_variant:wwNN`.

Note that if the variant form has the same length as the base form, #2 is as described in the first point, and #4 as described in the second point above. The `\__cs_generate_variant_loop_end:nwwwNNnn` breaking function takes the empty brace group in #4 as its first argument: this empty brace group produces the correct signature for the full variant.

(End of definition for \\_\_cs\_generate\_variant\_loop:nNwN and others.)

\\_\_cs\_generate\_variant\_same:N When the base and variant letters are identical, don't do any expansion. For most argument types, we can use the n-type no-expansion, but the N and p types require a slightly different behaviour with respect to braces. For V-type this function could output N to avoid adding useless braces but that is not a problem.

```

2861 \cs_new:Npn \__cs_generate_variant_same:N #1
2862 {
2863   \if:w N #1 #1 \else:

2867       \__cs_generate_variant_loop_special:NNwNNnn #1#1
2868     \fi:
2869   \fi:
2870   \fi:
2871 }

```

(End of definition for \\_\_cs\_generate\_variant\_same:N.)

\\_\_cs\_generate\_variant:wwNN If the variant form has already been defined, log its existence (provided log-functions is active). Otherwise, make sure that the \exp\_args:N #3 form is defined, and if it contains x, change \\_\_cs\_tmp:w locally to \cs\_new\_protected:Npe. Then define the variant by combining the \exp\_args:N #3 variant and the base function.

```

2872 \cs_new_protected:Npn \__cs_generate_variant:wwNN
2873 #1 \s__cs_mark #2 \s__cs_stop #3#4
2874 {

2881     \group_end:
2882   }
2883 }

```

(End of definition for \\_\_cs\_generate\_variant:wwNN.)

\\_\_cs\_generate\_internal\_variant:n First test for the presence of x (this is where working with strings makes our lives easier), as the result should be protected, and the next variant to be defined using that internal variant should be protected (done by setting \\_\_cs\_tmp:w). Then

call `\__cs_generate_internal_variant:NNn` with arguments `\cs_new_protected:cpn \use:x` (for protected) or `\cs_new:cpn \tex_expanded:D` (expandable) and the signature. If `p` appears in the signature, or if the function to be defined is expandable and the primitive `\expanded` is not available, or if there are more than 8 arguments, call some fall-back code that just puts the appropriate `\::` commands. Otherwise, call `\__cs_generate_internal_one_go:NNn` to construct the `\exp_args:N...` function as a macro taking up to 9 arguments and expanding them using `\use:x` or `\tex_expanded:D`.

`\exp_args_generate:n` This function is not used in the kernel hence we can use functions that are defined in later modules. It also does not need to be fast so use inline mappings. For each requested variant we check that there are no characters besides `NnpcofVvx`, in particular that there are no spaces. Then we just call the internal function.

```

3047 \cs_new_protected:Npn \exp_args_generate:n #1

3062 }

```

## 46.7 Definitions with the automated technique

Some of these could be done more efficiently, but the complexity of coding then becomes an issue. Notice that the auto-generated functions actually take no arguments themselves.

`\exp_args:Nnc` Here are the actual function definitions, using the helper functions above. The group is used because `\_cs_generate_internal_variant:n` redefines `\_cs_tmp:w` locally.

```
3063 \cs_set_protected:Npn \__cs_tmp:w #1
```

```

3064 {

3119 \cs_new_eq:NN \__sort_sep: \__kernel_int_sep:

(End of definition for \__sort_sep:.)
```

### 47.1 Variables

```
\g__sort_tmp_seq
\g__sort_tmp_tl
```

Sorting happens in a group; the result is stored in those global variables before being copied outside the group to the proper places. For seq and tl this is more efficient than using `\use:e` (or some `\exp_args:NNNe`) to smuggle the definition outside the group since TeX does not need to re-read tokens. For clist we don't gain anything since the result is converted from seq to clist anyways.

```
3120 \seq_new:N \g__sort_tmp_seq
3121 \tl_new:N \g__sort_tmp_tl

(End of definition for \g__sort_tmp_seq and \g__sort_tmp_tl.)
```

```
\l__sort_length_int
\l__sort_min_int
\l__sort_top_int
\l__sort_max_int
\l__sort_true_max_int
```

The sequence has `\l__sort_length_int` items and is stored from `\l__sort_min_int` to `\l__sort_top_int - 1`. While reading the sequence in memory, we check that `\l__sort_top_int` remains at most `\l__sort_max_int`, precomputed by `\__sort_compute_range:.` That bound is such that the merge sort only uses `\toks` registers less than `\l__sort_true_max_int`, namely those that have not been allocated for use in other code: the user's comparison code could alter these.

```
3122 \int_new:N \l__sort_length_int
3123 \int_new:N \l__sort_min_int
3124 \int_new:N \l__sort_top_int
3125 \int_new:N \l__sort_max_int
3126 \int_new:N \l__sort_true_max_int

(End of definition for \l__sort_length_int and others.)
```

`\l__sort_block_int` Merge sort is done in several passes. In each pass, blocks of size `\l__sort_block_int` are merged in pairs. The block size starts at 1, and, for a length in the range  $[2^k + 1, 2^{k+1}]$ , reaches  $2^k$  in the last pass.

```

3127 \int_new:N \l__sort_block_int

```

(End of definition for `\l__sort_block_int`.)

`\l__sort_begin_int` When merging two blocks, `\l__sort_begin_int` marks the lowest index in the two blocks, and `\l__sort_end_int` marks the highest index, plus 1.

```

3128 \int_new:N \l__sort_begin_int
3129 \int_new:N \l__sort_end_int

```

(End of definition for `\l__sort_begin_int` and `\l__sort_end_int`.)

`\l__sort_A_int` When merging two blocks (whose end-points are `beg` and `end`), *A* starts from the high end of the low block, and decreases until reaching `beg`. The index *B* starts from the top of the range and marks the register in which a sorted item should be put. Finally, *C* points to the copy of the high block in the interval of registers starting at `\l__sort_length_int`, upwards. *C* starts from the upper limit of that range.

```

3130 \int_new:N \l__sort_A_int
3131 \int_new:N \l__sort_B_int
3132 \int_new:N \l__sort_C_int

```

(End of definition for `\l__sort_A_int`, `\l__sort_B_int`, and `\l__sort_C_int`.)

`\s__sort_mark` Internal scan marks.

```

\s__sort_stop 3133 \scan_new:N \s__sort_mark
3134 \scan_new:N \s__sort_stop

```

(End of definition for `\s__sort_mark` and `\s__sort_stop`.)

## 47.2 Finding available `\toks` registers

`\__sort_shrink_range:` After `\__sort_compute_range:` (defined below) determines that `\toks` registers between `\l__sort_min_int` (included) and `\l__sort_true_max_int` (excluded) have not yet been assigned, `\__sort_shrink_range:` computes `\l__sort_max_int` to reflect the need for a buffer when merging blocks in the merge sort. Given  $2^n \leq A \leq 2^n + 2^{n-1}$  registers we can sort  $\lfloor A/2 \rfloor + 2^{n-2}$  items while if we have  $2^n + 2^{n-1} \leq A \leq 2^{n+1}$  registers we can sort  $A - 2^{n-1}$  items. We first find out a power  $2^n$  such that  $2^n \leq A \leq 2^{n+1}$  by repeatedly halving `\l__sort_block_int`, starting at  $2^{15}$  or  $2^{14}$  namely half the total number of registers, then we use the formulas and set `\l__sort_max_int`.

```

3135 \cs_new_protected:Npn \__sort_shrink_range:
3136 {
3137   \int_set:Nn \l__sort_A_int
3138     { \l__sort_true_max_int - \l__sort_min_int + 1 }
3139   \int_set:Nn \l__sort_block_int { \c_max_register_int / 2 }
3140   \__sort_shrink_range_loop:
3141   \int_set:Nn \l__sort_max_int
3142   {
3143     \int_compare:nNnTF
3144       { \l__sort_block_int * 3 / 2 } > \l__sort_A_int
3145     {

```

```

3146         \l__sort_min_int
3147         + ( \l__sort_A_int - 1 ) / 2
3148         + \l__sort_block_int / 4
3149         - 1
3150     }
3151     { \l__sort_true_max_int - \l__sort_block_int / 2 }
3152 }
3153 }
3154 \cs_new_protected:Npn \__sort_shrink_range_loop:
3155 {
3156     \if_int_compare:w \l__sort_A_int < \l__sort_block_int
3157     \tex_divide:D \l__sort_block_int 2 \exp_stop_f:
3158     \exp_after:wN \__sort_shrink_range_loop:
3159 \fi:
3160 }

```

(End of definition for `\__sort_shrink_range:` and `\__sort_shrink_range_loop:`.)

`\__sort_compute_range:` First find out what `\toks` have not yet been assigned. There are many cases. In  $\text{\LaTeX} 2_{\epsilon}$  with no package, available `\toks` range from `\count15 + 1` to `\c_max_register_int` included (this was not altered despite the 2015 changes). When `\loctoks` is defined, namely in plain (e) $\text{\TeX}$ , or when the package `etex` is loaded in  $\text{\LaTeX} 2_{\epsilon}$ , redefine `\__sort_compute_range:` to use the range `\count265` to `\count275 - 1`. The `elocalloc` package also defines `\loctoks` but uses yet another number for the upper bound, namely `\e@alloc@top` (minus one). We must check for `\loctoks` every time a sorting function is called, as `etex` or `elocalloc` could be loaded.

In  $\text{\ConTeXt}$  MkIV the range is from `\c_syst_last_allocated_toks + 1` to `\c_max_register_int`, and in MkII it is from `\lastallocatedtoks + 1` to `\c_max_register_int`. In all these cases, call `\__sort_shrink_range:`.

```

3161 \cs_new_protected:Npn \__sort_compute_range:
3162 {
3163     \int_set:Nn \l__sort_min_int { \tex_count:D 15 + 1 }
3164     \int_set:Nn \l__sort_true_max_int { \c_max_register_int + 1 }
3165     \__sort_shrink_range:
3166     \if_meaning:w \loctoks \tex_undefined:D \else:

3201             \int_set:Nn \l__sort_true_max_int { \c_max_register_int + 1 }
3202             \__sort_shrink_range:
3203         }
3204     }
3205 }

```

(End of definition for `\__sort_compute_range:`, `\__sort_redefine_compute_range:`, and `\c__sort_max_length_int`.)

## 47.3 Protected user commands

`\__sort_main:NNNn` Sorting happens in three steps. First store items in `\toks` registers ranging from `\l__sort_min_int` to `\l__sort_top_int - 1`, while checking that the list is not too long. If we reach the maximum length, that's an error; exit the group. Secondly, sort the array of `\toks` registers, using the user-defined sorting function: `\__sort_level:` calls `\__sort_compare:nn` as needed. Finally, unpack the `\toks` registers (now sorted) into the target `tl`, or into `\g__sort_tmp_seq` for `seq` and `clist`. This is done by `\__sort_seq:NNNNn` and `\__sort_tl:NNn`.

```

3206 \cs_new_protected:Npn \__sort_main:NNNn #1#2#3#4
3207 {
3208     \__sort_disable_tokstoksdef:
3209     \__sort_compute_range:
3210     \int_set_eq:NN \l__sort_top_int \l__sort_min_int
3211     #1 #3
3212     {
3213         \if_int_compare:w \l__sort_top_int = \l__sort_max_int
3214             \__sort_too_long_error:NNw #2 #3
3215         \fi:
3216         \tex_toks:D \l__sort_top_int {##1}
3217         \int_incr:N \l__sort_top_int
3218     }
3219     \int_set:Nn \l__sort_length_int
3220     { \l__sort_top_int - \l__sort_min_int }
3221     \cs_set:Npn \__sort_compare:nn ##1 ##2 {#4}
3222     \int_set:Nn \l__sort_block_int { 1 }
3223     \__sort_level:
3224 }

```

(End of definition for `\__sort_main:NNNn`.)

`\tl_sort:Nn` Call the main sorting function then unpack `\toks` registers outside the group into the  
`\tl_sort:cn` target token list. The unpacking is done by `\__sort_tl_toks:w`; registers are numbered  
`\tl_gsort:Nn` from `\l__sort_min_int` to `\l__sort_top_int - 1`. For expansion behaviour we need  
`\tl_gsort:cn` a couple of primitives. The `\tl_gclear:N` reduces memory usage. The `\prg_break_`  
`\__sort_tl:NNn` `point:` is used by `\__sort_main:NNNn` when the list is too long.  
`\__sort_tl_toks:w`

```

3225 \cs_new_protected:Npn \tl_sort:Nn { \__sort_tl:NNn \tl_set_eq:NN }
3226 \cs_generate_variant:Nn \tl_sort:Nn { c }
3227 \cs_new_protected:Npn \tl_gsort:Nn { \__sort_tl:NNn \tl_gset_eq:NN }
3228 \cs_generate_variant:Nn \tl_gsort:Nn { c }
3229 \cs_new_protected:Npn \__sort_tl:NNn #1#2#3
3230 {
3231   \group_begin:
3232     \__sort_main:NNNn \tl_map_inline:Nn \tl_map_break:n #2 {#3}
3233     \__kernel_tl_gset:Nx \g__sort_tmp_tl
3234     { \__sort_tl_toks:w \l__sort_min_int \__sort_sep: }
3235   \group_end:
3236   #1 #2 \g__sort_tmp_tl
3237   \tl_gclear:N \g__sort_tmp_tl
3238   \prg_break_point:
3239 }
3240 \cs_new:Npn \__sort_tl_toks:w #1 \__sort_sep:
3241 {
3242   \if_int_compare:w #1 < \l__sort_top_int
3243   { \tex_the:D \tex_toks:D #1 }
3244   \exp_after:wN \__sort_tl_toks:w
3245   \int_value:w \int_eval:n { #1 + 1 } \exp_after:wN \__sort_sep:
3246   \fi:
3247 }

```

(End of definition for `\tl_sort:Nn` and others. These functions are documented on page 128.)

`\seq_sort:Nn` Use the same general framework for seq and clist. Apply the general sorting code, then  
`\seq_sort:cn` unpack `\toks` into `\g__sort_tmp_seq`. Outside the group copy or convert (for clist) the  
`\seq_gsort:Nn` data to the target variable. The `\seq_gclear:N` reduces memory usage. The `\prg_`  
`\seq_gsort:cn` `break_point:` is used by `\__sort_main:NNNn` when the list is too long.  
`\clist_sort:Nn`  
`\clist_sort:cn`  
`\clist_gsort:Nn`  
`\clist_gsort:cn`  
`\__sort_seq:NNNNn`

```

3248 \cs_new_protected:Npn \seq_sort:Nn
3249 { \__sort_seq:NNNNn \seq_map_inline:Nn \seq_map_break:n \seq_set_eq:NN }
3250 \cs_generate_variant:Nn \seq_sort:Nn { c }
3251 \cs_new_protected:Npn \seq_gsort:Nn
3252 { \__sort_seq:NNNNn \seq_map_inline:Nn \seq_map_break:n \seq_gset_eq:NN }
3253 \cs_generate_variant:Nn \seq_gsort:Nn { c }
3254 \cs_new_protected:Npn \clist_sort:Nn
3255 {
3256   \__sort_seq:NNNNn \clist_map_inline:Nn \clist_map_break:n
3257   \clist_set_from_seq:NN
3258 }

3260 \cs_new_protected:Npn \clist_gsort:Nn
3261 {
3262   \__sort_seq:NNNNn \clist_map_inline:Nn \clist_map_break:n
3263   \clist_gset_from_seq:NN
3264 }

```

```

3265 \cs_generate_variant:Nn \clist_gsort:Nn { c }
3266 \cs_new_protected:Npn \__sort_seq:NNNNn #1#2#3#4#5
3267 {
3268   \group_begin:
3269     \__sort_main:NNNn #1 #2 #4 {#5}
3270     \seq_gclear:N \g__sort_tmp_seq
3271     \int_step_inline:nnn
3272       \l__sort_min_int { \l__sort_top_int - 1 }
3273     {
3274       \seq_gput_right:Ne \g__sort_tmp_seq
3275       { \tex_the:D \tex_toks:D ##1 }
3276     }
3277   \group_end:
3278   #3 #4 \g__sort_tmp_seq
3279   \seq_gclear:N \g__sort_tmp_seq
3280   \prg_break_point:
3281 }

```

(End of definition for `\seq_sort:Nn` and others. These functions are documented on page 164.)

## 47.4 Merge sort

`\__sort_level:` This function is called once blocks of size `\l__sort_block_int` (initially 1) are each sorted. If the whole list fits in one block, then we are done (this also takes care of the case of an empty list or a list with one item). Otherwise, go through pairs of blocks starting from 0, then double the block size, and repeat.

```

3282 \cs_new_protected:Npn \__sort_level:
3283 {
3284   \if_int_compare:w \l__sort_block_int < \l__sort_length_int
3285     \l__sort_end_int \l__sort_min_int
3286     \__sort_merge_blocks:
3287     \tex_advance:D \l__sort_block_int \l__sort_block_int
3288     \exp_after:wN \__sort_level:
3289   \fi:
3290 }

```

(End of definition for `\__sort_level:.`)

`\__sort_merge_blocks:` This function is called to merge a pair of blocks, starting at the last value of `\l__sort_end_int` (end-point of the previous pair of blocks). If shifting by one block to the right we reach the end of the list, then this pass has ended: the end of the list is sorted already. Otherwise, store the result of that shift in *A*, which indexes the first block starting from the top end. Then locate the end-point (maximum) of the second block: shift *end* upwards by one more block, but keeping it  $\leq$  *top*. Copy this upper block of *\toks* registers in registers above *length*, indexed by *C*: this is covered by `\__sort_copy_block:.` Once this is done we are ready to do the actual merger using `\__sort_merge_blocks_aux:`, after shifting *A*, *B* and *C* so that they point to the largest index in their respective ranges rather than pointing just beyond those ranges. Of course, once that pair of blocks is merged, move on to the next pair.

```

3291 \cs_new_protected:Npn \__sort_merge_blocks:
3292 {
3293   \l__sort_begin_int \l__sort_end_int

```

```

3294 \tex_advance:D \l__sort_end_int \l__sort_block_int
3295 \if_int_compare:w \l__sort_end_int < \l__sort_top_int
3296   \l__sort_A_int \l__sort_end_int
3297   \tex_advance:D \l__sort_end_int \l__sort_block_int
3298   \if_int_compare:w \l__sort_end_int > \l__sort_top_int
3299     \l__sort_end_int \l__sort_top_int
3300   \fi:
3301   \l__sort_B_int \l__sort_A_int
3302   \l__sort_C_int \l__sort_top_int
3303   \__sort_copy_block:
3304   \int_decr:N \l__sort_A_int
3305   \int_decr:N \l__sort_B_int
3306   \int_decr:N \l__sort_C_int

3349     \s\_sort_mark
3350     \_sort_return_swapped:w
3351   }
3352 \cs_new_protected:Npn \_sort_return_mark:w #1 \s\_sort_mark { }
3353 \cs_new_protected:Npn \_sort_return_none_error:
3354   {
3355     \msg_error:nnee { sort } { return-none }
3356     { \tex_the:D \tex_toks:D \l\_sort_A_int }
3357     { \tex_the:D \tex_toks:D \l\_sort_C_int }
3358     \_sort_return_same:w \_sort_return_none_error:
3359   }
3360 \cs_new_protected:Npn \_sort_return_two_error:
3361   {
3362     \msg_error:nnee { sort } { return-two }
3363     { \tex_the:D \tex_toks:D \l\_sort_A_int }
3364     { \tex_the:D \tex_toks:D \l\_sort_C_int }
3365   }
```

(End of definition for `\sort_return_same:` and others. These functions are documented on page 46.)

`\_sort_return_same:w` If the comparison function returns `same`, then the second argument fed to `\_sort_compare:nn` should remain to the right of the other one. Since we build the merger starting from the right, we copy that `\toks` register into the allotted range, then shift the pointers `B` and `C`, and go on to do one more step in the merger, unless the second block has been exhausted: then the remainder of the first block is already in the correct registers and we are done with merging those two blocks.

```
3366 \cs_new_protected:Npn \_sort_return_same:w #1 \_sort_return_none_error:
```

```

3367 {
3368   \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_C_int
3369   \int_decr:N \l__sort_B_int
3370   \int_decr:N \l__sort_C_int
3371   \if_int_compare:w \l__sort_C_int < \l__sort_top_int
3372     \use_i:nn
3373   \fi:
3374   \__sort_merge_blocks_aux:
3375 }

```

(End of definition for \\_\_sort\_return\_same:w.)

\\_\_sort\_return\_swapped:w If the comparison function returns `swapped`, then the next item to add to the merger is the first argument, contents of the `\toks` register  $A$ . Then shift the pointers  $A$  and  $B$  to the left, and go for one more step for the merger, unless the left block was exhausted ( $A$  goes below the threshold). In that case, all remaining `\toks` registers in the second block, indexed by  $C$ , are copied to the merger by `\__sort_merge_blocks_end:`.

```

3376 \cs_new_protected:Npn \__sort_return_swapped:w #1 \__sort_return_none_error:
3377 {
3378   \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_A_int
3379   \int_decr:N \l__sort_B_int
3380   \int_decr:N \l__sort_A_int
3381   \if_int_compare:w \l__sort_A_int < \l__sort_begin_int
3382     \__sort_merge_blocks_end: \use_i:nn
3383   \fi:
3384   \__sort_merge_blocks_aux:
3385 }

```

(End of definition for \\_\_sort\_return\_swapped:w.)

\\_\_sort\_merge\_blocks\_end: This function's task is to copy the `\toks` registers in the block indexed by  $C$  to the merger indexed by  $B$ . The end can equally be detected by checking when  $B$  reaches the threshold `begin`, or when  $C$  reaches `top`.

```

3386 \cs_new_protected:Npn \__sort_merge_blocks_end:
3387 {
3388   \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_C_int
3389   \int_decr:N \l__sort_B_int
3390   \int_decr:N \l__sort_C_int
3391   \if_int_compare:w \l__sort_B_int < \l__sort_begin_int
3392     \use_i:nn
3393   \fi:
3394   \__sort_merge_blocks_end:
3395 }

```

(End of definition for \\_\_sort\_merge\_blocks\_end:.)

## 47.5 Expandable sorting

Sorting expandably is very different from sorting and assigning to a variable. Since tokens cannot be stored, they must remain in the input stream, and be read through at every step. It is thus necessarily much slower (at best  $O(n^2 \ln n)$ ) than non-expandable sorting functions ( $O(n \ln n)$ ).

A prototypical version of expandable quicksort is as follows. If the argument has no item, return nothing, otherwise partition, using the first item as a pivot (argument #4 of `\__sort:nnNnn`). The arguments of `\__sort:nnNnn` are 1. items less than #4, 2. items greater or equal to #4, 3. comparison, 4. pivot, 5. next item to test. If #5 is the tail of the list, call `\tl_sort:nN` on #1 and on #2, placing #4 in between; `\use:ff` expands the parts to make `\tl_sort:nN` f-expandable. Otherwise, compare #4 and #5 using #3. If they are ordered, place #5 amongst the “greater” items, otherwise amongst the “lesser” items, and continue partitioning.

```
\cs_new:Npn \tl_sort:nN #1#2
{
  \tl_if_blank:nF {#1}
  {
    \__sort:nnNnn { } { } #2
    #1 \q__sort_recursion_tail \q__sort_recursion_stop
  }
}
\cs_new:Npn \__sort:nnNnn #1#2#3#4#5
{
  \quark_if_recursion_tail_stop_do:nn {#5}
  { \use:ff { \tl_sort:nN {#1} #3 {#4} } { \tl_sort:nN {#2} #3 } }
  #3 {#4} {#5}
  { \__sort:nnNnn {#1} { #2 {#5} } #3 {#4} }
  { \__sort:nnNnn { #1 {#5} } {#2} #3 {#4} }
}
\cs_generate_variant:Nn \use:nn { ff }
```

There are quite a few optimizations available here: the code below is less legible, but more than twice as fast.

In the simple version of the code, `\__sort:nnNnn` is called  $O(n \ln n)$  times on average (the number of comparisons required by the quicksort algorithm). Hence most of our focus is on optimizing that function.

The first speed up is to avoid testing for the end of the list at every call to `\__sort:nnNnn`. For this, the list is prepared by changing each  $\langle item \rangle$  of the original token list into  $\langle command \rangle \{ \langle item \rangle \}$ , just like sequences are stored. We arrange things such that the  $\langle command \rangle$  is the  $\langle conditional \rangle$  provided by the user: the loop over the  $\langle prepared tokens \rangle$  then looks like

```
\cs_new:Npn \__sort_loop:wNn ... #6#7
{
  #6 { \langle pivot \rangle } {#7} \langle loop big \rangle \langle loop small \rangle
  \langle extra arguments \rangle
}
\__sort_loop:wNn ... \langle prepared tokens \rangle
\langle end-loop \rangle {} \s__sort_stop
```

In this example, which matches the structure of `\__sort_quick_split_i:NnnnnNn` and a few other functions below, the `\__sort_loop:wNn` auxiliary normally receives the user’s  $\langle conditional \rangle$  as #6 and an  $\langle item \rangle$  as #7. This is compared to the  $\langle pivot \rangle$  (the argument #5, not shown here), and the  $\langle conditional \rangle$  leaves the  $\langle loop big \rangle$  or  $\langle loop small \rangle$  auxiliary, which both have the same form as `\__sort_loop:wNn`, receiving the

next pair  $\langle conditional \rangle \{ \langle item \rangle \}$  as #6 and #7. At the end, #6 is the  $\langle end-loop \rangle$  function, which terminates the loop.

The second speed up is to minimize the duplicated tokens between the `true` and `false` branches of the conditional. For this, we introduce two versions of `\__sort:nnNn`, which receive the new item as #1 and place it either into the list #2 of items less than the pivot #4 or into the list #3 of items greater or equal to the pivot.

```
\cs_new:Npn \__sort_i:nnnnNn #1#2#3#4#5#6
{
  #5 {#4} {#6} \__sort_ii:nnnnNn \__sort_i:nnnnNn
  {#6} { #2 {#1} } {#3} {#4}
}
\cs_new:Npn \__sort_ii:nnnnNn #1#2#3#4#5#6
{
  #5 {#4} {#6} \__sort_ii:nnnnNn \__sort_i:nnnnNn
  {#6} {#2} { #3 {#1} } {#4}
}
```

Note that the two functions have the form of `\__sort_loop:wNn` above, receiving as #5 the conditional or a function to end the loop. In fact, the lists #2 and #3 must be made of pairs  $\langle conditional \rangle \{ \langle item \rangle \}$ , so we have to replace {#6} above by { #5 {#6} }, and {#1} by #1. The actual functions have one more argument, so all argument numbers are shifted compared to this code.

The third speed up is to avoid `\use:ff` using a continuation-passing style: `\__sort_quick_split:NnNn` expects a list followed by `\s__sort_mark { \langle code \rangle }`, and expands to  $\langle code \rangle \langle sorted\ list \rangle$ . Sorting the two parts of the list around the pivot is done with

```
\__sort_quick_split:NnNn #2 ... \s__sort_mark
{
  \__sort_quick_split:NnNn #1 ... \s__sort_mark { \langle code \rangle }
  { \langle pivot \rangle }
}
```

Items which are larger than the  $\langle pivot \rangle$  are sorted, then placed after code that sorts the smaller items, and after the (braced)  $\langle pivot \rangle$ .

The fourth speed up is avoid the recursive call to `\tl_sort:nN` with an empty first argument. For this, we introduce functions similar to the `\__sort_i:nnnnNn` of the last example, but aware of whether the list of  $\langle conditional \rangle \{ \langle item \rangle \}$  read so far that are less than the pivot, and the list of those greater or equal, are empty or not: see `\__sort_quick_split:NnNn` and functions defined below. Knowing whether the lists are empty or not is useless if we do not use distinct ending codes as appropriate. The splitting auxiliaries communicate to the  $\langle end-loop \rangle$  function (that is initially placed after the “prepared” list) by placing a specific ending function, ignored when looping, but useful at the end. In fact, the  $\langle end-loop \rangle$  function does nothing but place the appropriate ending function in front of all its arguments. The ending functions take care of sorting non-empty sublists, placing the pivot in between, and the continuation before.

The final change in fact slows down the code a little, but is required to avoid memory issues: schematically, when `TeX` encounters

```
\use:n { \use:n { \use:n { ... } ... } ... }
```

the argument of the first `\use:n` is not completely read by the second `\use:n`, hence must remain in memory; then the argument of the second `\use:n` is not completely read when grabbing the argument of the third `\use:n`, hence must remain in memory, and so on. The memory consumption grows quadratically with the number of nested `\use:n`. In practice, this means that we must read everything until a trailing `\s__sort_stop` once in a while, otherwise sorting lists of more than a few thousand items would exhaust a typical T<sub>E</sub>X's memory.

`\tl_sort:nN`

`\__sort_quick_prepare:Nnnn`  
`\__sort_quick_prepare_end:NNNnw`  
`\__sort_quick_cleanup:w`

The code within the `\exp_not:f` sorts the list, leaving in most cases a leading `\exp_not:f`, which stops the expansion, letting the result be return within `\exp_not:n`. We filter out the case of a list with no item, which would otherwise cause problems. Then prepare the token list #1 by inserting the conditional #2 before each item. The `prepare` auxiliary receives the conditional as #1, the prepared token list so far as #2, the next prepared item as #3, and the item after that as #4. The loop ends when #4 contains `\prg_break_point:`, then the `prepare_end` auxiliary finds the prepared token list as #4. The scene is then set up for `\__sort_quick_split:NnNn`, which sorts the prepared list and perform the post action placed after `\s__sort_mark`, namely removing the trailing `\s__sort_stop` and `\s__sort_stop` and leaving `\exp_stop_f:` to stop f-expansion.

```

3396 \cs_new:Npn \tl_sort:nN #1#2
3397 {
3398   \exp_not:f
3399   {
3400     \tl_if_blank:nF {#1}
3401     {
3402       \__sort_quick_prepare:Nnnn #2 { } { }
3403       #1
3404       { \prg_break_point: \__sort_quick_prepare_end:NNNnw }
3405       \s__sort_stop
3406     }
3407   }
3408 }
3409 \cs_new:Npn \__sort_quick_prepare:Nnnn #1#2#3#4
3410 {
3411   \prg_break: #4 \prg_break_point:
3412   \__sort_quick_prepare:Nnnn #1 { #2 #3 } { #1 {#4} }
3413 }
3414 \cs_new:Npn \__sort_quick_prepare_end:NNNnw #1#2#3#4#5 \s__sort_stop
3415 {
3416   \__sort_quick_split:NnNn #4 \__sort_quick_end:nnTFNn { }
3417   \s__sort_mark { \__sort_quick_cleanup:w \exp_stop_f: }
3418   \s__sort_mark \s__sort_stop
3419 }
3420 \cs_new:Npn \__sort_quick_cleanup:w #1 \s__sort_mark \s__sort_stop {#1}

```

(End of definition for `\tl_sort:nN` and others. This function is documented on page 128.)

`\__sort_quick_split:NnNn`

`\__sort_quick_only_i:NnnnnNn`  
`\__sort_quick_only_ii:NnnnnNn`  
`\__sort_quick_split_i:NnnnnNn`  
`\__sort_quick_split_ii:NnnnnNn`

The `only_i`, `only_ii`, `split_i` and `split_ii` auxiliaries receive a useless first argument, the new item #2 (that they append to either one of the next two arguments), the list #3 of items less than the pivot, bigger items #4, the pivot #5, a *function* #6, and an item #7. The *function* is the user's *conditional* except at the end of the list where it is `\__sort_quick_end:nnTFNn`. The comparison is applied to the *pivot* and the *item*, and calls the `only_i` or `split_i` auxiliaries if the *item* is smaller, and the `only_ii` or `split_ii` auxiliaries otherwise. In both cases, the next auxiliary goes to

work right away, with no intermediate expansion that would slow down operations. Note that the argument #2 left for the next call has the form  $\langle conditional \rangle \{ \langle item \rangle \}$ , so that the lists #3 and #4 keep the right form to be fed to the next sorting function. The `split` auxiliary differs from these in that it is missing three of the arguments, which would be empty, and its first argument is always the user's  $\langle conditional \rangle$  rather than an ending function.

  \__sort_quick_only_i_end:nnnwnw
  \__sort_quick_only_ii_end:nnnwnw
  \__sort_quick_split_end:nnnwnw

```

The `\__sort_quick_end:nnTFNn` appears instead of the user's conditional, and receives as its arguments the pivot #1, a fake item #2, a true and a false branches #3 and #4, followed by an ending function #5 (one of the four auxiliaries here) and another copy #6 of the fake item. All those are discarded except the function #5. This function receives lists #1 and #2 of items less than or greater than the pivot #3, then a continuation code #5 just after `\s__sort_mark`. To avoid a memory problem described earlier, all of the ending functions read #6 until `\s__sort_stop` and place #6 back into the input stream. When the lists #1 and #2 are empty, the `single` auxiliary simply places the continuation #5 before the pivot {#3}. When #2 is empty, #1 is sorted and placed before

the pivot {#3}, taking care to feed the continuation #5 as a continuation for the function sorting #1. When #1 is empty, #2 is sorted, and the continuation argument is used to place the continuation #5 and the pivot {#3} before the sorted result. Finally, when both lists are non-empty, items larger than the pivot are sorted, then items less than the pivot, and the continuations are done in such a way to place the pivot in between.

## Chapter 48

# l3tl-analysis implementation

3541 `<@@=tl>`

### 48.1 Internal functions

`\s__tl` The format used to store token lists internally uses the scan mark `\s__tl` as a delimiter.

*(End of definition for `\s__tl`.)*

### 48.2 Internal format

The task of the `l3tl-analysis` module is to convert token lists to an internal format which allows us to extract all the relevant information about individual tokens (category code, character code), as well as reconstruct the token list quickly. This internal format is used in `l3regex` where we need to support arbitrary tokens, and it is used in conversion functions in `l3str-convert`, where we wish to support clusters of characters instead of single tokens.

We thus need a way to encode any `<token>` (even begin-group and end-group character tokens) in a way amenable to manipulating tokens individually. The best we can do is to find `<tokens>` which both `o`-expand and `e/x`-expand to the given `<token>`. Collecting more information about the category code and character code is also useful for regular expressions, since most regexes are catcode-agnostic. The internal format thus takes the form of a succession of items of the form

`<tokens> \s__tl <catcode> <char code> \s__tl`

The `<tokens>` `o`- and `e/x`-expand to the original token in the token list or to the cluster of tokens corresponding to one Unicode character in the given encoding (for `l3str-convert`). The `<catcode>` is given as a single hexadecimal digit, 0 for control sequences. The `<char code>` is given as a decimal number, `-1` for control sequences.

Using delimited arguments lets us build the `<tokens>` progressively when doing an encoding conversion in `l3str-convert`. On the other hand, the delimiter `\s__tl` may not appear unbraced in `<tokens>`. This is not a problem because we are careful to wrap control sequences in braces (as an argument to `\exp_not:n`) when converting from a general token list to the internal format.

The current rule for converting a `<token>` to a balanced set of `<tokens>` which both `o`-expands and `e/x`-expands to it is the following.

- A control sequence `\cs` becomes `\exp_not:n { \cs } \s__tl 0 -1 \s__tl`.
- A begin-group character `{` becomes `\exp_after:wN { \if_false: } \fi: \s__tl 1 <char code> \s__tl`.
- An end-group character `}` becomes `\if_false: { \fi: } \s__tl 2 <char code> \s__tl`.
- A character with any other category code becomes `\exp_not:n {<character>} \s__tl <hex catcode> <char code> \s__tl`.

In contrast, for `\peek_analysis_map_inline:n` we must allow for an input stream containing `\outer` macros, so that wrapping all control sequences in `\exp_not:n` is unsafe. Instead, we write the more elaborate `\__kernel_exp_not:w \exp_after:wN { \exp_not:N \cs }`. (On the other hand we make a better effort by avoiding `\exp_not:n` for characters other than active and macro parameters.)

3542 `<*code>`

## 48.3 Variables and helper functions

`\s__tl` The scan mark `\s__tl` is used as a delimiter in the internal format. This is more practical than using a quark, because we would then need to control expansion much more carefully: compare `\int_value:w '#1 \s__tl` with `\int_value:w '#1 \exp_stop_f: \exp_not:N \q_mark` to extract a character code followed by the delimiter in an e-expansion.

3543 `\scan_new:N \s__tl`

*(End of definition for \s\_\_tl.)*

`\l__tl_analysis_token` The tokens in the token list are probed with the TeX primitive `\futurelet`. We use `\l__tl_analysis_token` in that construction. In some cases, we convert the following token to a string before probing it: then the token variable used is `\l__tl_analysis_char_token`.

3544 `\cs_new_eq:NN \l__tl_analysis_token ?`

3545 `\cs_new_eq:NN \l__tl_analysis_char_token ?`

*(End of definition for \l\_\_tl\_analysis\_token and \l\_\_tl\_analysis\_char\_token.)*

`\l__tl_peek_code_tl` Holds some code to be run once the next token has been fully analysed in `\peek_analysis_map_inline:n`.

3546 `\tl_new:N \l__tl_peek_code_tl`

*(End of definition for \l\_\_tl\_peek\_code\_tl.)*

`\c__tl_peek_catcodes_tl` A token list containing the character number 32 (space) with all possible category codes except 1 and 2 (begin-group and end-group). Why 32? Because some LuaTeX versions only allow creation of catcode 10 (space) tokens with this character code, so that we decided to make `\char_generate:nn` refuse to create such weird spaces as well. We do not include the macro parameter case (catcode 6) because it cannot be used as a macro delimiter.

3547 `\group_begin:`

3548 `\char_set_active_eq:NN \ \scan_stop:`

3549 `\tl_const:Ne \c__tl_peek_catcodes_tl`

```

3550 {
3551   \char_generate:nn { 32 } { 3 } 3
3552   \char_generate:nn { 32 } { 4 } 4
3553   \char_generate:nn { 32 } { 7 } 7
3554   \char_generate:nn { 32 } { 8 } 8
3555   \c_space_tl \token_to_str:N A
3556   \char_generate:nn { 32 } { 11 } \token_to_str:N B
3557   \char_generate:nn { 32 } { 12 } \token_to_str:N C
3558   \char_generate:nn { 32 } { 13 } \token_to_str:N D
3559 }
3560 \group_end:

```

*(End of definition for \c\_\_tl\_peek\_catcodes\_tl.)*

`\l__tl_analysis_normal_int` The number of normal (N-type argument) tokens since the last special token.

```
3561 \int_new:N \l__tl_analysis_normal_int
```

*(End of definition for \l\_\_tl\_analysis\_normal\_int.)*

`\l__tl_analysis_index_int` During the first pass, this is the index in the array being built. During the second pass, it is equal to the maximum index in the array from the first pass.

```
3562 \int_new:N \l__tl_analysis_index_int
```

*(End of definition for \l\_\_tl\_analysis\_index\_int.)*

`\l__tl_analysis_nesting_int` Nesting depth of explicit begin-group and end-group characters during the first pass. This lets us detect the end of the token list without a reserved end-marker.

```
3563 \int_new:N \l__tl_analysis_nesting_int
```

*(End of definition for \l\_\_tl\_analysis\_nesting\_int.)*

`\l__tl_analysis_type_int` When encountering special characters, we record their “type” in this integer.

```
3564 \int_new:N \l__tl_analysis_type_int
```

*(End of definition for \l\_\_tl\_analysis\_type\_int.)*

`\g__tl_analysis_result_tl` The result of the conversion is stored in this token list, with a succession of items of the form

`⟨tokens⟩ \s__tl ⟨catcode⟩ ⟨char code⟩ \s__tl`

```
3565 \tl_new:N \g__tl_analysis_result_tl
```

*(End of definition for \g\_\_tl\_analysis\_result\_tl.)*

`\__tl_analysis_extract_charcode:`  
`\__tl_analysis_extract_charcode_aux:w` Extracting the character code from the meaning of `\l__tl_analysis_token`. This has no error checking, and should only be assumed to work for begin-group and end-group character tokens. It produces a number in the form ‘`⟨char⟩`’. LuaMetaTeX uses a different format for `\meaning`, so there is a little work to do: we extract the Unicode value this contains.

```

3566 \cs_new:Npn \__tl_analysis_extract_charcode:
3567 {
3568   \exp_after:wN \__tl_analysis_extract_charcode_aux:w
3569   \token_to_meaning:N \l__tl_analysis_token
3570 }
3571 \cs_new:Npn \__tl_analysis_extract_charcode_aux:w #1 ~ #2 ~ { ‘ ’ }

```

```

3572 \bool_lazy_and:nnT
3573 { \cs_if_exist_p:N \tex_ luatexversion:D }

```

(End of definition for `\__tl_analysis_cs_space_count:NN`, `\__tl_analysis_cs_space_count:w`, and `\__tl_analysis_cs_space_count_end:w`.)

## 48.4 Plan of attack

Our goal is to produce a token list of the form roughly

```

⟨token 1⟩ \s__tl ⟨catcode 1⟩ ⟨char code 1⟩ \s__tl
⟨token 2⟩ \s__tl ⟨catcode 2⟩ ⟨char code 2⟩ \s__tl
... ⟨token N⟩ \s__tl ⟨catcode N⟩ ⟨char code N⟩ \s__tl

```

Most but not all tokens can be grabbed as an undelimited (N-type) argument by `TeX`. The plan is to have a two pass system. In the first pass, locate special tokens, and store them in various `\toks` registers. In the second pass, which is done within an `e`-expanding assignment, normal tokens are taken in as N-type arguments, and special tokens are retrieved from the `\toks` registers, and removed from the input stream by some means. The whole process takes linear time, because we avoid building the result one item at a time.

We make the escape character printable (backslash, but this later oscillates between slash and backslash): this allows us to distinguish characters from control sequences.

A token has two characteristics: its `\meaning`, and what it looks like for `TEX` when it is in scanning mode (*e.g.*, when capturing parameters for a macro). For our purposes, we distinguish the following meanings:

- begin-group token (category code 1), either space (character code 32), or non-space;
- end-group token (category code 2), either space (character code 32), or non-space;
- space token (category code 10, character code 32);
- anything else (then the token is always an N-type argument).

The token itself can “look like” one of the following

- a non-active character, in which case its meaning is automatically that associated to its character code and category code, we call it “true” character;
- an active character;
- a control sequence.

The only tokens which are not valid N-type arguments are true begin-group characters, true end-group characters, and true spaces. We detect those characters by scanning ahead with `\futurelet`, then distinguishing true characters from control sequences set equal to them using the `\string` representation.

The second pass is a simple exercise in expandable loops.

`\__tl_analysis:n` Everything is done within a group, and all definitions are local. We use `\group_align_safe_begin/end:` to avoid problems in case `\__tl_analysis:n` is used within an alignment and its argument contains alignment tab tokens.

```

3598 \cs_new_protected:Npn \__tl_analysis:n #1
3599 {
3600   \group_begin:
3601   \group_align_safe_begin:
3602     \__tl_analysis_a:n {#1}
3603     \__tl_analysis_b:n {#1}
3604   \group_align_safe_end:
3605   \group_end:
3606 }
```

(End of definition for `\__tl_analysis:n`.)

## 48.5 Disabling active characters

`\__tl_analysis_disable:n` Active characters can cause problems later on in the processing, so we provide a way to disable them, by setting them to `undefined`. Since Unicode contains too many characters to loop over all of them, we instead do this whenever we encounter a character. For `pTEX` and `upTEX` we skip characters beyond [0, 255] because `\lccode` only allows those values.

```

3607 \group_begin:
3608   \char_set_catcode_active:N \^^@
3609   \cs_new_protected:Npn \__tl_analysis_disable:n #1
3610   {
```

```

3611 \tex_lccode:D 0 = #1 \exp_stop_f:
3612 \tex_lowercase:D { \tex_let:D ^^@ } \tex_undefined:D
3613 }
3614 \bool_lazy_or:nnT
3615 { \sys_if_engine_ptex_p: }
3616 { \sys_if_engine_uptex_p: }
3617 {
3618 \cs_gset_protected:Npn \__tl_analysis_disable:n #1
3619 {
3620 \if_int_compare:w 256 > #1 \exp_stop_f:
3621 \tex_lccode:D 0 = #1 \exp_stop_f:
3622 \tex_lowercase:D { \tex_let:D ^^@ } \tex_undefined:D
3623 \fi:
3624 }
3625 }
3626 \group_end:

```

*(End of definition for \\_\_tl\_analysis\_disable:n.)*

`\__tl_analysis_disable_char:N` Similar to `\__tl_analysis_disable:n`, but it receives a normal character token, tests if that token is active (by turning it into a space: the active space has been undefined at this point), and if so, disables it. Even if the character is active and set equal to a primitive conditional, nothing blows up. Again, in pTeX and upTeX we skip characters beyond [0,255], which cannot be active anyways.

```

3627 \group_begin:
3628 \char_set_catcode_active:N \^^@
3629 \cs_new_protected:Npn \__tl_analysis_disable_char:N #1
3630 {
3631 \tex_lccode:D '#1 = 32 \exp_stop_f:

3641 {
3642 \if_int_compare:w 256 > '#1 \exp_stop_f:
3643 \tex_lccode:D '#1 = 32 \exp_stop_f:
3644 \tex_lowercase:D { \if_meaning:w #1 } \tex_undefined:D
3645 \tex_let:D #1 \tex_undefined:D
3646 \fi:
3647 \fi:
3648 }
3649 }
3650 \group_end:

```

*(End of definition for \\_\_tl\_analysis\_disable\_char:N.)*

## 48.6 First pass

The goal of this pass is to detect special (non-N-type) tokens, and count how many N-type tokens lie between special tokens. Also, we wish to store some representation of each special token in a `\toks` register.

We have 11 types of tokens:

1. a true non-space begin-group character;
2. a true space begin-group character;
3. a true non-space end-group character;
4. a true space end-group character;
5. a true space blank space character;
6. an active character;
7. any other true character;
8. a control sequence equal to a begin-group token (category code 1);
9. a control sequence equal to an end-group token (category code 2);
10. a control sequence equal to a space token (character code 32, category code 10);
11. any other control sequence.

Our first tool is `\futurelet`. This cannot distinguish case 8 from 1 or 2, nor case 9 from 3 or 4, nor case 10 from case 5. Those cases are later distinguished by applying the `\string` primitive to the following token, after possibly changing the escape character to ensure that a control sequence's string representation cannot be mistaken for the true character.

In cases 6, 7, and 11, the following token is a valid N-type argument, so we grab it and distinguish the case of a character from a control sequence: in the latter case, `\str_tail:n {\token}` is non-empty, because the escape character is printable.

`\__tl_analysis_a:n` We read tokens one by one using `\futurelet`. While performing the loop, we keep track of the number of true begin-group characters minus the number of true end-group characters in `\l__tl_analysis_nesting_int`. This reaches `-1` when we read the closing brace.

```

3651 \cs_new_protected:Npn \__tl_analysis_a:n #1
3652 {
3653   \__tl_analysis_disable:n { 32 }
3654   \int_set:Nn \tex_escapechar:D { 92 }
3655   \int_zero:N \l__tl_analysis_normal_int
3656   \int_zero:N \l__tl_analysis_index_int
3657   \int_zero:N \l__tl_analysis_nesting_int
3658   \if_false: { \fi: \__tl_analysis_a_loop:w #1 }
3659   \int_decr:N \l__tl_analysis_index_int
3660 }
```

*(End of definition for `\__tl_analysis_a:n`.)*

```

\__tl_analysis_a_loop:w Read one character and check its type.
3661 \cs_new_protected:Npn \__tl_analysis_a_loop:w
3662 { \tex_futurelet:D \l__tl_analysis_token \__tl_analysis_a_type:w }

```

(End of definition for \\_\_tl\_analysis\_a\_loop:w.)

\\_\_tl\_analysis\_a\_type:w At this point, \l\_\_tl\_analysis\_token holds the meaning of the following token. We store in \l\_\_tl\_analysis\_type\_int information about the meaning of the token ahead:

- 0 space token;
- 1 begin-group token;
- -1 end-group token;
- 2 other.

The values 0, 1, -1 correspond to how much a true such character changes the nesting level (2 is used only here, and is irrelevant later). Then call the auxiliary for each case. Note that nesting conditionals here is safe because we only skip over \l\_\_tl\_analysis\_token if it matches with one of the character tokens (hence is not a primitive conditional).

```

3663 \cs_new_protected:Npn \__tl_analysis_a_type:w
3664 {
3665   \l__tl_analysis_type_int =
3666   \if_meaning:w \l__tl_analysis_token \c_space_token

3672       \if_catcode:w \exp_not:N \l__tl_analysis_token \c_group_end_token
3673         - 1
3674       \else:
3675         2
3676     \fi:
3677   \fi:
3678   \fi:
3679   \exp_stop_f:
3680   \if_case:w \l__tl_analysis_type_int
3681     \exp_after:wN \__tl_analysis_a_space:w
3682   \or: \exp_after:wN \__tl_analysis_a_bgroup:w
3683   \or: \exp_after:wN \__tl_analysis_a_safe:N
3684   \else: \exp_after:wN \__tl_analysis_a_egroup:w
3685   \fi:
3686 }

```

(End of definition for \\_\_tl\_analysis\_a\_type:w.)

\\_\_tl\_analysis\_a\_space:w In this branch, the following token's meaning is a blank space. Apply \string to that token: a true blank space gives a space, a control sequence gives a result starting with the escape character, an active character gives something else than a space since we disabled the space. We grab as \l\_\_tl\_analysis\_char\_token the first character of the string representation then test it in \\_\_tl\_analysis\_a\_space\_test:w. Also, since \\_\_tl\_analysis\_a\_store: expects the special token to be stored in the relevant \toks register, we do that. The extra \exp\_not:n is unnecessary of course, but it makes

the treatment of all tokens more homogeneous. If we discover that the next token was actually a control sequence or an active character instead of a true space, then we step the counter of normal tokens. We now have in front of us the whole string representation of the control sequence, including potential spaces; those will appear to be true spaces later in this pass. Hence, all other branches of the code in this first pass need to consider the string representation, so that the second pass does not need to test the meaning of tokens, only strings.

The token is most likely a true character token with catcode 1 or 2, but it might be a control sequence, or an active character. Optimizing for the first case, we store in a `toks` register some code that expands to that token. Since we will turn what follows into a string, we make sure the escape character is different from the current character code (by switching between solidus and backslash). To detect the special case of an active character let to the catcode 1 or 2 character with the same character code, we disable the active character with that character code and re-test: if the following token has become undefined we can in fact safely grab it. We are finally ready to turn what follows to a string and test it. This is one place where we need `\l__tl_analysis_char_token` to be a separate control sequence from `\l__tl_analysis_token`, to compare them.

*(End of definition for \\_\_tl\_analysis\_a\_bgroup:w and others.)*

`\__tl_analysis_a_store:` This function is called each time we meet a special token; at this point, the `\toks` register `\l__tl_analysis_index_int` holds a token list which expands to the given special token. Also, the value of `\l__tl_analysis_type_int` indicates which case we are in:

- -1 end-group character;
- 0 space character;
- 1 begin-group character.

We need to distinguish further the case of a space character (code 32) from other character codes, because those behave differently in the second pass. Namely, after testing the `\lccode` of 0 (which holds the present character code) we change the cases above to

- -2 space end-group character;
- -1 non-space end-group character;
- 0 space blank space character;
- 1 non-space begin-group character;
- 2 space begin-group character.

This has the property that non-space characters correspond to odd values of `\l__tl_analysis_type_int`. The number of normal tokens until here and the type of special

token are packed into a `\skip` register. Finally, we check whether we reached the last closing brace, in which case we stop by disabling the looping function (locally).

(End of definition for `\__tl_analysis_a_store:`)

`\__tl_analysis_a_safe:N`  
`\__tl_analysis_a_cs:ww`

This should be the simplest case: since the upcoming token is safe, we can simply grab it in a second pass. If the token is a single character (including space), the `\if_charcode:w` test yields true; we disable a potentially active character (that could otherwise masquerade as the true character in the next pass) and we count one “normal” token. On the other hand, if the token is a control sequence, we should replace it by its string representation for compatibility with other code branches. Instead of slowly looping through the characters with the main code, we use the knowledge of how the second pass works: if the control sequence name contains no space, count that token as a number of normal tokens equal to its string length. If the control sequence contains spaces, they should be registered as special characters by increasing `\l__tl_analysis_index_int` (no need to carefully count character between each space), and all characters after the last space should be counted in the following sequence of “normal” tokens.

## 48.7 Second pass

The second pass is an exercise in expandable loops. All the necessary information is stored in `\skip` and `\toks` registers.

`\__tl_analysis_b:n` Start the loop with the index 0. No need for an end-marker: the loop stops by itself when the last index is read. We repeatedly oscillate between reading long stretches of normal tokens, and reading special tokens.

```

3789 \cs_new_protected:Npn \__tl_analysis_b:n #1
3790 {
3791     \__kernel_tl_gset:Nx \g__tl_analysis_result_tl

3801 }

```

(End of definition for `\__tl_analysis_b:n` and `\__tl_analysis_b_loop:w`.)

`\__tl_analysis_b_normals:ww` The first argument is the number of normal tokens which remain to be read, and the second argument is the index in the array produced in the first step. A character's string representation is always one character long, while a control sequence is always longer (we have set the escape character to a printable value). In both cases, we leave `\exp_not:n` `{\token}` `\s__tl` in the input stream (after e-expansion). Here, `\exp_not:n` is used rather than `\exp_not:N` because `#3` could be a macro parameter character or could be `\s__tl` (which must be hidden behind braces in the result).

```

## 48.8 Mapping through the analysis

```

\tl_analysis_map_inline:Nn
\tl_analysis_map_inline:nn
    \__tl_analysis_map:Nn
    \__tl_analysis_map:NwNw

```

First obtain the analysis of the token list into `\g__tl_analysis_result_tl`. To allow nested mappings, increase the nesting depth `\g__kernel_prg_map_int` (shared between all modules), then define the payload macro, which runs the user code and has a name specific to that nesting depth. The looping macro grabs the `<tokens>`, `<catcode>` and `<char code>`; it checks for the end of the loop with `\use_none:n ##2`, normally empty, but which becomes `\tl_map_break:` at the end; it then calls the payload macro with the arguments in the correct order (this is the reason why we cannot directly use the same macro for looping and payload), and loops by calling itself. When the loop ends, remember to decrease the nesting depth.

```

Save the user's code in a control sequence that is suitable for nested maps. We may wish to pass to this function an `\outer` control sequence or active character; for this we will undefine any expandable token (testing if it is `\outer` is much slower) within a group, closed immediately after the function reads its arguments to avoid affecting the user's code or even our peek code (there is no risk of undefining `\group_end`: itself since that is not expandable). This user's code function also calls the loop auxiliary, and includes the trailing `\prg_break_point:Nn` for when the user wants to stop the loop. The loop auxiliary must remove that break point because it must look at the input stream.

```

```

The loop starts a group (closed by the user-code function defined above) with a normalized escape character, and checks if the next token is special or N-type (distinguishing expandable from non-expandable tokens). The test for nonexpandable tokens in `\__tl_peek_analysis_test`: must be done after the tests for begin-group, end-group, and space tokens, in case `\l_peek_token` is either `\outer` or is a primitive T<sub>E</sub>X conditional, as such tokens cannot be skipped over correctly by conditional code.

```

Expandable tokens (which are automatically N-type) can be `\outer` macros, hence the need for `\exp_after:wN` and `\exp_not:N` in the code above, which allows the next function to safely grab the token as an argument. To allow the possibly-`\outer` token #1 as an argument of the `\user's function` (which is protected and stored in `\l__tl_peek_code_tl`), we set it equal to a harmless macro. This must be done at the very last minute because #1 may be some pretty important function such as `\exp_after:wN`. Using a primitive `\cs_set_nopar:Npe` expansion (to avoid `\outer` problems) we set up to run the code `\let #1 \user's function \user's function` followed by arguments involving #1. Regardless of #1 (including the user's function itself), the user's function is run. It always starts with `\group_end:`, which has not been redefined since #1 started out as expandable, and which restores the definition of #1.

Then we put the elaborate first argument `\_kernel_exp_not:w \exp_after:wN { \exp_not:N #1 }`: indeed we cannot use `\exp_not:n {#1}` as this breaks for an `\outer` macro and we cannot use `\exp_not:N #1`, as o-expanding this yields a “notexpanded” token equal to (a weird) `\relax`, which would have the wrong value for primitive TeX conditionals such as `\if_meaning:w`.

Then we must add `{-1}0` if the token is a control sequence and `{\charcode}`D otherwise. Distinguishing the two cases is easy: since we have made the escape character printable, `\token_to_str:N` gives at least two characters for a control sequence versus a single one for an active character (possibly being a space, in which case the trailing brace group is taken as the first argument of `\_tl_peek_analysis_exp_aux:Nw`). Importantly, #1 could be an `\outer` token (as it is only set to `\scan_stop:` at the last minute) but once we apply `\token_to_str:N` we no longer need to worry about it.

```

For normal non-expandable tokens we must distinguish characters (including active ones and macro parameter characters) from control sequences (whose string representation is more than one character because we made the escape character printable). For a control sequence call the user code with suitable arguments, wrapping #1 within `\exp_not:n` just in case it happens to be equal to a macro parameter character. We do not skip `\exp_not:n` when unnecessary, because this auxiliary is also called in `\__tl_peek_analysis_retest:` where we have changed some control sequences or active characters to `\scan_stop:` temporarily.

```

For normal characters we must determine their catcode. The main difficulty is that the character may be an active character masquerading as (i.e., set equal to) itself with a different catcode. Two approaches based on `\lowercase` can detect this. One could make an active character with the same catcode as #1 and change its definition before testing the catcode of #1, but in some Unicode engine this fills up the hash table uselessly. Instead, we lowercase #1 itself, changing its character code to 32, namely space (because LuaTeX cannot turn catcode 10 characters to anything else than character code 32), then we apply `\__tl_analysis_b_char:Nn`, which detects active characters by comparing them to `\tex_undefined:D`, and we must have undefined the active space (locally) for this test to work. To define `\__tl_peek_analysis_char:N` itself we use an e-expanding assignment to get the active space in the right place after making it (just for this definition) unexpandable. Finally `\__tl_peek_analysis_char:w` receives the `<charcode>`, `<user function>`, `<catcode>`, and `<token>`, and places the arguments in the correct order. It keeps `\exp_not:n` for macro parameter characters and active characters (the latter could be macro parameter characters, and it seems more uniform to always put `\exp_not:n`), and otherwise eliminates it by expanding once with `\exp_args:NNNo`.

```

For special characters the idea is to eventually act with `\token_to_str:N`, then pick up one by one the characters of this string representation until hitting the token that follows. First determine the character code of (the meaning of) the `<token>` (which we know is a special token), make sure the escape character is different from it, normalize the meanings of two active characters and the empty control sequence, and filter out these cases in `\__tl_peek_analysis_retest:`.

```

```

```

4182     \fi:
4183 }

```

At this point we know the meaning of the  $\langle token \rangle$  in the input stream is  $\backslash l\_peek\_token$ , either a space (32, 10) or a begin-group or end-group token (catcode 1 or 2), and we excluded a few cases that would be difficult later (empty control sequence, active character with the same character code as its meaning or as the escape character). The idea is to apply  $\backslash token\_to\_str:N$  to the  $\langle token \rangle$  then grab characters (of category code 12 except for spaces that have category code 10) to reconstruct it. In earlier versions of the code we would peek at the  $\langle next\ token \rangle$  that lies after  $\langle token \rangle$  in the input stream, which would help us be more accurate in reconstructing the  $\langle token \rangle$  case in edge cases (mentioned below), but this had the side-effect of tokenizing the input stream (turning characters into tokens) farther ahead than needed.

We hit the  $\langle token \rangle$  with  $\backslash token\_to\_str:N$  and start grabbing characters. More precisely, by looking at the first character in the string representation of the  $\langle token \rangle$  we distinguish three cases: a stringified control sequence starts with the escape character; for an explicit character we find that same character; for an active character we find anything else (we made sure to exclude the case of an active character whose string representation coincides with the other two cases).

```

4184 \cs_new_protected:Npn \__tl_peek_analysis_str:
4185 {
4186     \exp_after:wN \tex_futurelet:D
4187     \exp_after:wN \l__tl_analysis_token
4188     \exp_after:wN \__tl_peek_analysis_str:w
4189     \token_to_str:N
4190 }
4191 \cs_new_protected:Npn \__tl_peek_analysis_str:w
4192 { \__tl_analysis_char_arg:Nw \__tl_peek_analysis_str:n }
4193 \cs_new_protected:Npn \__tl_peek_analysis_str:n #1
4194 {
4195     \int_case:nnF { '#1 }
4196     {
4197         { \l__tl_peek_charcode_int }
4198         { \__tl_peek_analysis_explicit:n {#1} }
4199         { \tex_escapechar:D } { \__tl_peek_analysis_escape: }
4200     }
4201     { \__tl_peek_analysis_active_str:n {#1} }
4202 }

```

When  $\#1$  is a stringified active character we pass appropriate arguments to the user's code; thankfully  $\backslash char\_generate:nn$  can make active characters.

```

4203 \cs_new_protected:Npn \__tl_peek_analysis_active_str:n #1
4204 {
4205     \tl_put_right:Ne \l__tl_peek_code_tl
4206     {
4207         { \char_generate:nn { '#1 } { 13 } }
4208         { \int_value:w '#1 }
4209         \token_to_str:N D
4210     }
4211     \l__tl_peek_code_tl
4212 }

```

When  $\#1$  matches the character we had extracted from the meaning of  $\backslash l\_peek\_token$ , the token was an explicit character, which can be a standard space, or a begin-group or

end-group character with some character code. In the latter two cases we call `\char_generate:nn` with suitable arguments and put suitable `\if_false: \fi:` constructions to make the result balanced and such that o-expanding or e/x-expanding gives back a single (unbalanced) begin-group or end-group character.

```

4213 \cs_new_protected:Npn \__tl_peek_analysis_explicit:n #1
4214 {
4215   \tl_put_right:Ne \l__tl_peek_code_tl
4216   {
4217     \if_meaning:w \l_peek_token \c_space_token
4218     { ~ } { 32 } \token_to_str:N A
4219   \else:
4220     \if_catcode:w \l_peek_token \c_group_begin_token
4221     {
4222       \exp_not:N \exp_after:wN
4223       \char_generate:nn { '#1 } { 1 }
4224       \exp_not:N \if_false:
4225       \if_false: { \fi: }
4226       \exp_not:N \fi:
4227     }
4228     { \int_value:w '#1 }
4229     1
4230   \else:
4231     {
4232       \exp_not:N \if_false:
4233       { \if_false: } \fi:
4234       \exp_not:N \fi:
4235       \char_generate:nn { '#1 } { 2 }
4236     }
4237     { \int_value:w '#1 }
4238     2
4239   \fi:
4240   \fi:
4241 }
4242 \l__tl_peek_code_tl
4243 }
```

Finally there is the case of a special token whose string representation starts with an escape character, namely the token was a control sequence. In that case we could have grabbed the token directly as an N-type argument, but of course we couldn't know that until we had run all the various tests including stringifying the token. We are thus left with the hard work of picking up one by one the characters in the csname (being careful about spaces), until the constructed csname has the expected meaning. This fails if someone defines a token like `\bgroup@my` whose string representation starts the same as another token with the same meaning being an implicit character token of category code 1, 2, or 10.

```

4244 \cs_new_protected:Npn \__tl_peek_analysis_escape:
4245 {
4246   \tl_clear:N \l__tl_tmpa_tl
4247   \tex_futurelet:D \l__tl_analysis_token
4248   \__tl_peek_analysis_collect:w
4249 }
4250 \cs_new_protected:Npn \__tl_peek_analysis_collect:w
4251 { \__tl_analysis_char_arg:Nw \__tl_peek_analysis_collect:n }
```

```

4252 \cs_new_protected:Npn \__tl_peek_analysis_collect:n #1
4253 {

## Chapter 49

# l3regex implementation

```
4294 <*code>
4295 <@@=regex>
```

### 49.1 Plan of attack

Most regex engines use backtracking. This allows to provide very powerful features (back-references come to mind first), but it is costly, and raises the problem of catastrophic backtracking. Since T<sub>E</sub>X is not first and foremost a programming language, complicated code tends to run slowly, and we must use faster, albeit slightly more restrictive, techniques, coming from automata theory.

Given a regular expression of  $n$  characters, we do the following:

- (Compiling.) Analyse the regex, finding invalid input, and convert it to an internal representation.
- (Building.) Convert the compiled regex to a non-deterministic finite automaton (NFA) with  $O(n)$  states which accepts precisely token lists matching that regex.
- (Matching.) Loop through the query token list one token (one “position”) at a time, exploring in parallel every possible path (“active thread”) through the NFA, considering active threads in an order determined by the quantifiers’ greediness.

We use the following vocabulary in the code comments (and in variable names).

- *Group*: index of the capturing group,  $-1$  for non-capturing groups.
- *Position*: each token in the query is labelled by an integer  $\langle position \rangle$ , with  $\min\_pos - 1 \leq \langle position \rangle \leq \max\_pos$ . The lowest and highest positions  $\min\_pos - 1$  and  $\max\_pos$  correspond to imaginary begin and end markers (with non-existent category code and character code).  $\max\_pos$  is only set quite late in the processing.
- *Query*: the token list to which we apply the regular expression.
- *State*: each state of the NFA is labelled by an integer  $\langle state \rangle$  with  $\min\_state \leq \langle state \rangle < \max\_state$ .
- *Active thread*: state of the NFA that is reached when reading the query token list for the matching. Those threads are ordered according to the greediness of quantifiers.

- *Step*: used when matching, starts at 0, incremented every time a character is read, and is not reset when searching for repeated matches. The integer `\l__regex_step_int` is a unique id for all the steps of the matching algorithm.

We use `\l3intarray` to manipulate arrays of integers. We also abuse  $\text{\TeX}$ 's `\toks` registers, by accessing them directly by number rather than tying them to control sequence using the `\newtoks` allocation functions. Specifically, these arrays and `\toks` are used as follows. When building, `\toks<state>` holds the tests and actions to perform in the `<state>` of the NFA. When matching,

- `\g__regex_state_active_intarray` holds the last `<step>` in which each `<state>` was active.
- `\g__regex_thread_info_intarray` consists of blocks for each `<thread>` (with  $\text{min\_thread} \leq \text{<thread>} < \text{max\_thread}$ ). Each block has  $1+2\text{\l__regex\_capturing\_group\_int}$  entries: the `<state>` in which the `<thread>` currently is, followed by the beginnings of all submatches, and then the ends of all submatches. The `<threads>` are ordered starting from the best to the least preferred.
- `\g__regex_submatch_prev_intarray`, `\g__regex_submatch_begin_intarray` and `\g__regex_submatch_end_intarray` hold, for each submatch (as would be extracted by `\regex_extract_all:nnN`), the place where the submatch started to be looked for and its two end-points. For historical reasons, the minimum index is twice `max_state`, and the used registers go up to `\l__regex_submatch_int`. They are organized in blocks of `\l__regex_capturing_group_int` entries, each block corresponding to one match with all its submatches stored in consecutive entries.

When actually building the result,

- `\toks<position>` holds `<tokens>` which o- and e-expand to the `<position>`-th token in the query.
- `\g__regex_balance_intarray` holds the balance of begin-group and end-group character tokens which appear before that point in the token list.

The code is structured as follows. Variables are introduced in the relevant section. First we present some generic helper functions. Then comes the code for compiling a regular expression, and for showing the result of the compilation. The building phase converts a compiled regex to NFA states, and the automaton is run by the code in the following section. The only remaining brick is parsing the replacement text and performing the replacement. We are then ready for all the user functions. Finally, messages, and a little bit of tracing code.

## 49.2 Helpers

`\__regex_int_eval:w` Access the primitive: performance is key here, so we do not use the slower route *via* `\int_eval:n`.

4296 `\cs_new_eq:NN \__regex_int_eval:w \tex_numexpr:D`

(End of definition for `\__regex_int_eval:w`.)

`\__regex_sep:`

4297 `\cs_new_eq:NN \__regex_sep: \__kernel_int_sep:`

(End of definition for `\__regex_sep:.`)

`\__regex_standard_escapechar:` Make the `\escapechar` into the standard backslash.

```
4298 \cs_new_protected:Npn \__regex_standard_escapechar:
4299 { \int_set:Nn \tex_escapechar:D { '\ } }
```

(End of definition for `\__regex_standard_escapechar:.`)

`\__regex_toks_use:w` Unpack a `\toks` given its number.

```
4300 \cs_new:Npn \__regex_toks_use:w { \tex_the:D \tex_toks:D }
```

(End of definition for `\__regex_toks_use:w`.)

`\__regex_toks_clear:N` Empty a `\toks` or set it to a value, given its number.

```
\__regex_toks_set:Nn
\__regex_toks_set:No
4301 \cs_new_protected:Npn \__regex_toks_clear:N #1
4302 { \tex_toks:D #1 = { } }
4303 \cs_new_eq:NN \__regex_toks_set:Nn \tex_toks:D
4304 \cs_new_protected:Npn \__regex_toks_set:No #1
4305 { \tex_toks:D #1 = \exp_after:wN }
```

(End of definition for `\__regex_toks_clear:N` and `\__regex_toks_set:Nn`.)

`\__regex_toks_memcpy:NNn` Copy `#3` `\toks` registers from `#2` onwards to `#1` onwards, like C's `memcpy`.

```
4306 \cs_new_protected:Npn \__regex_toks_memcpy:NNn #1#2#3
4307 {
4308   \prg_replicate:nn {#3}
4309   {
4310     \tex_toks:D #1 = \tex_toks:D #2
4311     \int_incr:N #1
4312     \int_incr:N #2
4313   }
4314 }
```

(End of definition for `\__regex_toks_memcpy:NNn`.)

`\__regex_toks_put_left:Ne` During the building phase we wish to add e-expanded material to `\toks`, either to the left  
`\__regex_toks_put_right:Ne` or to the right. The expansion is done “by hand” for optimization (these operations are  
`\__regex_toks_put_right:Nn` used quite a lot). The `Nn` version of `\__regex_toks_put_right:Ne` is provided because  
it is more efficient than e-expanding with `\exp_not:n`.

```
4315 \cs_if_exist:NTF \tex_etokspre:D
4316 { \cs_new_eq:NN \__regex_toks_put_left:Ne \tex_etokspre:D }
4317 {
4318   \cs_new_protected:Npn \__regex_toks_put_left:Ne #1#2
4319   { \tex_toks:D #1 = \tex_expanded:D {{ #2 \tex_the:D \tex_toks:D #1 }} }
4320 }
4321 \cs_if_exist:NTF \tex_etoksapp:D
4322 { \cs_new_eq:NN \__regex_toks_put_right:Ne \tex_etoksapp:D }
4323 {
4324   \cs_new_protected:Npn \__regex_toks_put_right:Ne #1#2
4325   { \tex_toks:D #1 = \tex_expanded:D {{ \tex_the:D \tex_toks:D #1 #2 }} }
4326 }
4327 \cs_if_exist:NTF \tex_toksapp:D
4328 { \cs_new_eq:NN \__regex_toks_put_right:Nn \tex_toksapp:D }
4329 {
4330   \cs_new_protected:Npn \__regex_toks_put_right:Nn #1#2
```

```

4331     { \tex_toks:D #1 = \exp_after:wN { \tex_the:D \tex_toks:D #1 #2 } }
4332   }

```

(End of definition for `\__regex_toks_put_left:Ne` and `\__regex_toks_put_right:Ne`.)

`\__regex_curr_cs_to_str:` Expands to the string representation of the token (known to be a control sequence) at the current position `\l__regex_curr_pos_int`. It should only be used in `e/x`-expansion to avoid losing a leading space.

```

4333 \cs_new:Npn \__regex_curr_cs_to_str:
4334 {
4335     \exp_after:wN \exp_after:wN \exp_after:wN \cs_to_str:N
4336     \l__regex_curr_token_tl
4337 }

```

(End of definition for `\__regex_curr_cs_to_str:.`)

`\__regex_intarray_item:NnF` Item of intarray, with a default value.

```

\__regex_intarray_item_aux:nNF
4338 \cs_new:Npn \__regex_intarray_item:NnF #1#2
4339 { \exp_args:No \__regex_intarray_item_aux:nNF { \tex_the:D \__regex_int_eval:w #2 } #1 }
4340 \cs_new:Npn \__regex_intarray_item_aux:nNF #1#2
4341 {
4342     \if_int_compare:w #1 > \c_zero_int
4343     \exp_after:wN \use_ii:nnn
4344     \fi:
4345     \use_ii:nn { \__kernel_intarray_item:Nn #2 {#1} }
4346 }

```

(End of definition for `\__regex_intarray_item:NnF` and `\__regex_intarray_item_aux:nNF`.)

`\__regex_maplike_break:` Analogous to `\tl_map_break:`, this correctly exits `\tl_map_inline:nn` and similar constructions and jumps to the matching `\prg_break_point:Nn \__regex_maplike_break: { }`.

```

4347 \cs_new:Npn \__regex_maplike_break:
4348 { \prg_map_break:Nn \__regex_maplike_break: { } }

```

(End of definition for `\__regex_maplike_break:.`)

`\__regex_tl_odd_items:n` Map through a token list one pair at a time, leaving the odd-numbered or even-numbered items (the first item is numbered 1).

```

\__regex_tl_even_items:n
\__regex_tl_even_items_loop:nn
4349 \cs_new:Npn \__regex_tl_odd_items:n #1 { \__regex_tl_even_items:n { ? #1 } }
4350 \cs_new:Npn \__regex_tl_even_items:n #1
4351 {
4352     \__regex_tl_even_items_loop:nn #1 \q__regex_nil \q__regex_nil
4353     \prg_break_point:
4354 }
4355 \cs_new:Npn \__regex_tl_even_items_loop:nn #1#2
4356 {
4357     \__regex_use_none_delimit_by_q_nil:w #2 \prg_break: \q__regex_nil
4358     { \exp_not:n {#2} }
4359     \__regex_tl_even_items_loop:nn
4360 }

```

(End of definition for `\__regex_tl_odd_items:n`, `\__regex_tl_even_items:n`, and `\__regex_tl_even_items_loop:nn`.)

## 49.2.1 Constants and variables

`\__regex_tmp:w` Temporary function used for various short-term purposes.

```
4361 \cs_new:Npn \__regex_tmp:w { }
```

*(End of definition for \\_\_regex\_tmp:w.)*

`\l__regex_tmpa_tl` Temporary variables used for various purposes.

```
\l__regex_tmpb_tl 4362 \tl_new:N \l__regex_tmpa_tl
\l__regex_tmpa_int 4363 \tl_new:N \l__regex_tmpb_tl
\l__regex_tmpb_int 4364 \int_new:N \l__regex_tmpa_int
\l__regex_tmpc_int 4365 \int_new:N \l__regex_tmpb_int
\l__regex_tmp_bool 4366 \int_new:N \l__regex_tmpc_int
\l__regex_tmp_seq 4367 \bool_new:N \l__regex_tmp_bool
\g__regex_tmp_tl 4368 \seq_new:N \l__regex_tmp_seq
4369 \tl_new:N \g__regex_tmp_tl
```

*(End of definition for \l\_\_regex\_tmpa\_tl and others.)*

`\l__regex_build_tl` This temporary variable is specifically for use with the `tl_build` machinery.

```
4370 \tl_new:N \l__regex_build_tl
```

*(End of definition for \l\_\_regex\_build\_tl.)*

`\c__regex_no_match_regex` This regular expression matches nothing, but is still a valid regular expression. We could use a failing assertion, but I went for an empty class. It is used as the initial value for regular expressions declared using `\regex_new:N`.

```
4371 \tl_const:Nn \c__regex_no_match_regex
4372 {
4373   \__regex_branch:n
4374   { \__regex_class:NnnnN \c_true_bool { } { 1 } { 0 } \c_true_bool }
4375 }
```

*(End of definition for \c\_\_regex\_no\_match\_regex.)*

`\l__regex_balance_int` During this phase, `\l__regex_balance_int` counts the balance of begin-group and end-group character tokens which appear before a given point in the token list. This variable is also used to keep track of the balance in the replacement text.

```
4376 \int_new:N \l__regex_balance_int
```

*(End of definition for \l\_\_regex\_balance\_int.)*

## 49.2.2 Testing characters

`\c__regex_ascii_min_int`

`\c__regex_ascii_max_control_int`

`\c__regex_ascii_max_int`

```
4377 \int_const:Nn \c__regex_ascii_min_int { 0 }
4378 \int_const:Nn \c__regex_ascii_max_control_int { 31 }
4379 \int_const:Nn \c__regex_ascii_max_int { 127 }
```

*(End of definition for \c\_\_regex\_ascii\_min\_int, \c\_\_regex\_ascii\_max\_control\_int, and \c\_\_regex\_ascii\_max\_int.)*

`\c__regex_ascii_lower_int`

```
4380 \int_const:Nn \c__regex_ascii_lower_int { 'a - 'A }
```

*(End of definition for \c\_\_regex\_ascii\_lower\_int.)*

### 49.2.3 Internal auxiliaries

`\q__regex_recursion_stop` Internal recursion quarks.

```
4381 \quark_new:N \q__regex_recursion_stop
```

(End of definition for `\q__regex_recursion_stop`.)

`\q__regex_nil` Internal quarks.

```
4382 \quark_new:N \q__regex_nil
```

(End of definition for `\q__regex_nil`.)

`\__regex_use_none_delimit_by_q_recursion_stop:w` Functions to gobble up to a quark.

`\__regex_use_i_delimit_by_q_recursion_stop:nw`

`\__regex_use_none_delimit_by_q_nil:w`

```
4383 \cs_new:Npn \__regex_use_none_delimit_by_q_recursion_stop:w
```

```
4384   #1 \q__regex_recursion_stop { }
```

```
4385 \cs_new:Npn \__regex_use_i_delimit_by_q_recursion_stop:nw
```

```
4386   #1 #2 \q__regex_recursion_stop {#1}
```

```
4387 \cs_new:Npn \__regex_use_none_delimit_by_q_nil:w #1 \q__regex_nil { }
```

(End of definition for `\__regex_use_none_delimit_by_q_recursion_stop:w`, `\__regex_use_i_delimit_by_q_recursion_stop:nw`, and `\__regex_use_none_delimit_by_q_nil:w`.)

`\__regex_quark_if_nil_p:n` Branching quark conditional.

`\__regex_quark_if_nil:nTF`

```
4388 \__kernel_quark_new_conditional:Nn \__regex_quark_if_nil:N { F }
```

(End of definition for `\__regex_quark_if_nil:nTF`.)

`\__regex_break_point:TF`

`\__regex_break_true:w`

When testing whether a character of the query token list matches a given character class in the regular expression, we often have to test it against several ranges of characters, checking if any one of those matches. This is done with a structure like

```

<test1> ... <testn>
__regex_break_point:TF {<true code>} {<false code>}

```

If any of the tests succeeds, it calls `\__regex_break_true:w`, which cleans up and leaves `<true code>` in the input stream. Otherwise, `\__regex_break_point:TF` leaves the `<false code>` in the input stream.

```
4389 \cs_new_protected:Npn \__regex_break_true:w
```

```
4390   #1 \__regex_break_point:TF #2 #3 {#2}
```

```
4391 \cs_new_protected:Npn \__regex_break_point:TF #1 #2 { #2 }
```

(End of definition for `\__regex_break_point:TF` and `\__regex_break_true:w`.)

`\__regex_item_reverse:n`

This function makes showing regular expressions easier, and lets us define `\D` in terms of `\d` for instance. There is a subtlety: the end of the query is marked by `-2`, and thus matches `\D` and other negated properties; this case is caught by another part of the code.

```
4392 \cs_new_protected:Npn \__regex_item_reverse:n #1
```

```
4393   {
```

```
4394     #1
```

```
4395     \__regex_break_point:TF { } \__regex_break_true:w
```

```
4396   }
```

(End of definition for `\__regex_item_reverse:n`.)

\\_regex\_item\_caseful\_equal:n  
\\_regex\_item\_caseful\_range:nn

Simple comparisons triggering \\_regex\_break\_true:w when true.

```

4397 \cs_new_protected:Npn \_regex_item_caseful_equal:n #1
4398 {
4399   \if_int_compare:w #1 = \l__regex_curr_char_int

## 49.2.4 Character property tests

`\\_regex_prop_d:` Character property tests for `\\d`, `\\W`, etc. These character properties are not affected by the `(?i)` option. The characters recognized by each one are as follows: `\\d=[0-9]`,

`\\_regex_prop_h:`

`\\_regex_prop_s:`

`\\_regex_prop_v:`

`\\_regex_prop_w:`

`\\_regex_prop_N:`

`\w=[0-9A-Z_a-z]`, `\s=[\_\^\^I\^J\^L\^M]`, `\h=[\_\^\^I]`, `\v=[\^J-\^M]`, and the upper case counterparts match anything that the lower case does not match. The order in which the various tests appear is optimized for usual mostly lower case letter text.

```

4513 \cs_new_protected:Npn \__regex_prop_d:
4514 { \__regex_item_caseful_range:nn { '0 } { '9 } }
4515 \cs_new_protected:Npn \__regex_prop_h:

```

(End of definition for `\__regex_posix_alnum:` and others.)

## 49.2.5 Simple character escape

Before actually parsing the regular expression or the replacement text, we go through them once, converting `\n` to the character 10, etc. In this pass, we also convert any special character (`*`, `?`, `{`, etc.) or escaped alphanumeric character into a marker indicating that this was a special sequence, and replace escaped special characters and non-escaped alphanumeric characters by markers indicating that those were “raw” characters. The rest of the code can then avoid caring about escaping issues (those can become quite complex to handle in combination with ranges in character classes).

Usage: `\__regex_escape_use:nnnn` *<inline 1>* *<inline 2>* *<inline 3>* *{<token list>}* The *<token list>* is converted to a string, then read from left to right, interpreting backslashes as escaping the next character. Unescaped characters are fed to the function *<inline 1>*, and escaped characters are fed to the function *<inline 2>* within an *e*-expansion context (typically those functions perform some tests on their argument to decide how to output them). The escape sequences `\a`, `\e`, `\f`, `\n`, `\r`, `\t` and `\x` are recognized, and those are replaced by the corresponding character, then fed to *<inline 3>*. The result is then left in the input stream. Spaces are ignored unless escaped.

The conversion is done within an *e*-expanding assignment.

`\__regex_escape_use:nnnn` The result is built in `\l__regex_tmpa_tl`, which is then left in the input stream. Tracing code is added as appropriate inside this token list. Go through #4 once, applying #1, #2,

or #3 as relevant to each character (after de-escaping it).

```

4588 \cs_new_protected:Npn \__regex_escape_use:nnnn #1#2#3#4
4589 {
4590   \group_begin:
4591     \tl_clear:N \l__regex_tmpa_tl
4592     \cs_set:Npn \__regex_escape_unescaped:N ##1 { #1 }
4593     \cs_set:Npn \__regex_escape_escaped:N ##1 { #2 }
4594     \cs_set:Npn \__regex_escape_raw:N ##1 { #3 }
4595     \__regex_standard_escapechar:
4596     \__kernel_tl_gset:Nx \g__regex_tmp_tl
4597       { \__kernel_str_to_other_fast:n {#4} }
4598     \tl_put_right:Ne \l__regex_tmpa_tl

4742     }

```

(End of definition for \\_regex\_hexadecimal\_use:NTF.)

\\_regex\_char\_if\_alphanumeric:NTF   These two tests are used in the first pass when parsing a regular expression. That pass is responsible for finding escaped and non-escaped characters, and recognizing which ones have special meanings and which should be interpreted as “raw” characters. Namely,

- alphanumeric characters are “raw” if they are not escaped, and may have a special meaning when escaped;
- non-alphanumeric printable ASCII characters are “raw” if they are escaped, and may have a special meaning when not escaped;
- characters other than printable ASCII are always “raw”.

The code is ugly, and highly based on magic numbers and the ascii codes of characters. This is mostly unavoidable for performance reasons. Maybe the tests can be optimized a little bit more. Here, “alphanumeric” means 0–9, A–Z, a–z; “special” character means non-alphanumeric but printable ascii, from space (hex 20) to del (hex 7E).

```

## 49.3 Compiling

A regular expression starts its life as a string of characters. In this section, we convert it to internal instructions, resulting in a “compiled” regular expression. This compiled expression is then turned into states of an automaton in the building phase. Compiled regular expressions consist of the following:

- `\_regex_class:NnnnN`  $\langle\text{boolean}\rangle$   $\{\langle\text{tests}\rangle\}$   $\{\langle\text{min}\rangle\}$   $\{\langle\text{more}\rangle\}$   $\langle\text{laziness}\rangle$
- `\_regex_group:nnnN`  $\{\langle\text{branches}\rangle\}$   $\{\langle\text{min}\rangle\}$   $\{\langle\text{more}\rangle\}$   $\langle\text{laziness}\rangle$ , also `\_regex_group_no_capture:nnnN` and `\_regex_group_resetting:nnnN` with the same syntax.
- `\_regex_branch:n`  $\{\langle\text{contents}\rangle\}$
- `\_regex_command_K:`
- `\_regex_assertion:Nn`  $\langle\text{boolean}\rangle$   $\{\langle\text{assertion test}\rangle\}$ , where the  $\langle\text{assertion test}\rangle$  is `\_regex_b_test:` or `\_regex_Z_test:` or `\_regex_A_test:` or `\_regex_G_test:`

Tests can be the following:

- `\_regex_item_caseful_equal:n`  $\{\langle\text{char code}\rangle\}$
- `\_regex_item_caseless_equal:n`  $\{\langle\text{char code}\rangle\}$
- `\_regex_item_caseful_range:nn`  $\{\langle\text{min}\rangle\}$   $\{\langle\text{max}\rangle\}$
- `\_regex_item_caseless_range:nn`  $\{\langle\text{min}\rangle\}$   $\{\langle\text{max}\rangle\}$
- `\_regex_item_catcode:nT`  $\{\langle\text{catcode bitmap}\rangle\}$   $\{\langle\text{tests}\rangle\}$
- `\_regex_item_catcode_reverse:nT`  $\{\langle\text{catcode bitmap}\rangle\}$   $\{\langle\text{tests}\rangle\}$
- `\_regex_item_reverse:n`  $\{\langle\text{tests}\rangle\}$
- `\_regex_item_exact:nn`  $\{\langle\text{catcode}\rangle\}$   $\{\langle\text{char code}\rangle\}$
- `\_regex_item_exact_cs:n`  $\{\langle\text{csnames}\rangle\}$ , more precisely given as  $\langle\text{csname}\rangle$  `\scan_stop:`  $\langle\text{csname}\rangle$  `\scan_stop:`  $\langle\text{csname}\rangle$  and so on in a brace group.
- `\_regex_item_cs:n`  $\{\langle\text{compiled regex}\rangle\}$

### 49.3.1 Variables used when compiling

`\l__regex_group_level_int`

We make sure to open the same number of groups as we close.

```
4798 \int_new:N \l__regex_group_level_int
```

*(End of definition for \l\_\_regex\_group\_level\_int.)*

`\l__regex_mode_int`

While compiling, ten modes are recognized, labelled  $-63$ ,  $-23$ ,  $-6$ ,  $-2$ ,  $0$ ,  $2$ ,  $3$ ,  $6$ ,  $23$ ,  $63$ .

See section 49.3.3. We only define some of these as constants.

`\c__regex_cs_in_class_mode_int`

`\c__regex_cs_mode_int`

`\c__regex_outer_mode_int`

`\c__regex_catcode_mode_int`

`\c__regex_class_mode_int`

`\c__regex_catcode_in_class_mode_int`

```
4799 \int_new:N \l__regex_mode_int
```

```
4800 \int_const:Nn \c__regex_cs_in_class_mode_int { -6 }
```

```
4801 \int_const:Nn \c__regex_cs_mode_int { -2 }
```

```
4802 \int_const:Nn \c__regex_outer_mode_int { 0 }
```

```
4803 \int_const:Nn \c__regex_catcode_mode_int { 2 }
```

```
4804 \int_const:Nn \c__regex_class_mode_int { 3 }
```

```
4805 \int_const:Nn \c__regex_catcode_in_class_mode_int { 6 }
```

*(End of definition for \l\_\_regex\_mode\_int and others.)*

`\l__regex_catcodes_int`

`\l__regex_default_catcodes_int`

`\l__regex_catcodes_bool`

We wish to allow constructions such as `\c[^BE](. . \cL[a-z] . .)`, where the outer catcode test applies to the whole group, but is superseded by the inner catcode test. For this to work, we need to keep track of lists of allowed category codes: `\l__regex_catcodes_int` and `\l__regex_default_catcodes_int` are bitmaps, sums of  $4^c$ , for all allowed catcodes  $c$ . The latter is local to each capturing group, and we reset `\l__regex_catcodes_int` to that value after each character or class, changing it only when encountering a `\c` escape. The boolean records whether the list of categories of a catcode test has to be inverted: compare `\c[^BE]` and `\c[BE]`.

```
4806 \int_new:N \l__regex_catcodes_int
```

```
4807 \int_new:N \l__regex_default_catcodes_int
```

```
4808 \bool_new:N \l__regex_catcodes_bool
```

*(End of definition for \l\_\_regex\_catcodes\_int, \l\_\_regex\_default\_catcodes\_int, and \l\_\_regex\_catcodes\_bool.)*

`\c__regex_catcode_C_int`

`\c__regex_catcode_B_int`

`\c__regex_catcode_E_int`

`\c__regex_catcode_M_int`

`\c__regex_catcode_T_int`

`\c__regex_catcode_P_int`

`\c__regex_catcode_U_int`

`\c__regex_catcode_D_int`

`\c__regex_catcode_S_int`

`\c__regex_catcode_L_int`

`\c__regex_catcode_O_int`

`\c__regex_catcode_A_int`

`\c__regex_all_catcodes_int`

Constants:  $4^c$  for each category, and the sum of all powers of 4.

```
4809 \int_const:Nn \c__regex_catcode_C_int { "1 }
```

```
4810 \int_const:Nn \c__regex_catcode_B_int { "4 }
```

```
4811 \int_const:Nn \c__regex_catcode_E_int { "10 }
```

```
4812 \int_const:Nn \c__regex_catcode_M_int { "40 }
```

```
4813 \int_const:Nn \c__regex_catcode_T_int { "100 }
```

```
4814 \int_const:Nn \c__regex_catcode_P_int { "1000 }
```

```
4815 \int_const:Nn \c__regex_catcode_U_int { "4000 }
```

```
4816 \int_const:Nn \c__regex_catcode_D_int { "10000 }
```

```
4817 \int_const:Nn \c__regex_catcode_S_int { "100000 }
```

```
4818 \int_const:Nn \c__regex_catcode_L_int { "400000 }
```

```
4819 \int_const:Nn \c__regex_catcode_O_int { "1000000 }
```

```
4820 \int_const:Nn \c__regex_catcode_A_int { "4000000 }
```

```
4821 \int_const:Nn \c__regex_all_catcodes_int { "5515155 }
```

*(End of definition for \c\_\_regex\_catcode\_C\_int and others.)*

`\l__regex_tmp_regex`

The compilation step stores its result in this variable.

```
4822 \cs_new_eq:NN \l__regex_tmp_regex \c__regex_no_match_regex
```

*(End of definition for \l\_\_regex\_tmp\_regex.)*

`\l__regex_show_prefix_seq` This sequence holds the prefix that makes up the line displayed to the user. The various items must be removed from the right, which is tricky with a token list, hence we use a sequence.

```
4823 \seq_new:N \l__regex_show_prefix_seq
```

*(End of definition for \l\_\_regex\_show\_prefix\_seq.)*

`\l__regex_show_lines_int` A hack. To know whether a given class has a single item in it or not, we count the number of lines when showing the class.

```
4824 \int_new:N \l__regex_show_lines_int
```

*(End of definition for \l\_\_regex\_show\_lines\_int.)*

### 49.3.2 Generic helpers used when compiling

`\__regex_two_if_eq:NNNTF` Used to compare pairs of things like `\__regex_compile_special:N ?` together. It's often inconvenient to get the catcodes of the character to match so we just compare the character code. Besides, the expanding behaviour of `\if:w` is very useful as that means we can use `\c_left_brace_str` and the like.

```
4825 \cs_new:Npn \__regex_two_if_eq:NNNTF #1#2#3#4
4826 {
4827   \if_meaning:w #1 #3
4828   \if:w #2 #4
4829   \exp_after:wN \exp_after:wN \exp_after:wN \use_ii:nnn
4830   \fi:
4831   \fi:
4832   \use_ii:nn
4833 }
```

*(End of definition for \\_\_regex\_two\_if\_eq:NNNTF.)*

`\__regex_get_digits:NTFw` If followed by some raw digits, collect them one by one in the integer variable `#1`, and  
`\__regex_get_digits_loop:w` take the `true` branch. Otherwise, take the `false` branch.

```
4834 \cs_new_protected:Npn \__regex_get_digits:NTFw #1#2#3#4#5
4835 {
4836   \__regex_if_raw_digit:NNTF #4 #5
4837   { #1 = #5 \__regex_get_digits_loop:nw {#2} }
4838   { #3 #4 #5 }
4839 }
4840 \cs_new:Npn \__regex_get_digits_loop:nw #1#2#3
4841 {
4842   \__regex_if_raw_digit:NNTF #2 #3
4843   { #3 \__regex_get_digits_loop:nw {#1} }
4844   { \scan_stop: #1 #2 #3 }
4845 }
```

*(End of definition for \\_\_regex\_get\_digits:NTFw and \\_\_regex\_get\_digits\_loop:w.)*

`\__regex_if_raw_digit:NNTF` Test used when grabbing digits for the `{m,n}` quantifier. It only accepts non-escaped digits.

```
4846 \cs_new:Npn \__regex_if_raw_digit:NNTF #1#2
4847 {
4848   \if_meaning:w \__regex_compile_raw:N #1
4849   \if_int_compare:w \c_one_int < 1 #2 \exp_stop_f:
```

```

4850         \exp_after:wN \exp_after:wN \exp_after:wN \use_ii:nnn
4851         \fi:
4852     \fi:
4853     \use_ii:nn
4854 }

```

(End of definition for `\_regex_if_raw_digit:NNTF`.)

### 49.3.3 Mode

When compiling the NFA corresponding to a given regex string, we can be in ten distinct modes, which we label by some magic numbers:

- 6 `[\c{...}]` control sequence in a class,
- 2 `\c{...}` control sequence,
- 0 ... outer,
- 2 `\c...` catcode test,
- 6 `[\c...]` catcode test in a class,
- 63 `[\c{[...]}]` class inside mode -6,
- 23 `\c{[...]}` class inside mode -2,
- 3 `[...]` class inside mode 0,
- 23 `\c[...]` class inside mode 2,
- 63 `[\c[...]]` class inside mode 6.

This list is exhaustive, because `\c` escape sequences cannot be nested, and character classes cannot be nested directly. The choice of numbers is such as to optimize the most useful tests, and make transitions from one mode to another as simple as possible.

- Even modes mean that we are not directly in a character class. In this case, a left bracket appends 3 to the mode. In a character class, a right bracket changes the mode as  $m \rightarrow (m - 15)/13$ , truncated.
- Grouping, assertion, and anchors are allowed in non-positive even modes (0, -2, -6), and do not change the mode. Otherwise, they trigger an error.
- A left bracket is special in even modes, appending 3 to the mode; in those modes, quantifiers and the dot are recognized, and the right bracket is normal. In odd modes (within classes), the left bracket is normal, but the right bracket ends the class, changing the mode from  $m$  to  $(m - 15)/13$ , truncated; also, ranges are recognized.
- In non-negative modes, left and right braces are normal. In negative modes, however, left braces trigger a warning; right braces end the control sequence, going from -2 to 0 or -6 to 3, with error recovery for odd modes.
- Properties (such as the `\d` character class) can appear in any mode.

`\_regex_if_in_class:TF` Test whether we are directly in a character class (at the innermost level of nesting). There, many escape sequences are not recognized, and special characters are normal. Also, for every raw character, we must look ahead for a possible raw dash.

```

4855 \prg_new_conditional:Npnn \_regex_if_in_class: { TF }
4856 {
4857   \if_int_odd:w \l__regex_mode_int
4858   \prg_return_true:
4859   \else:
4860     \prg_return_false:
4861   \fi:
4862 }

```

*(End of definition for \\_regex\_if\_in\_class:TF.)*

`\_regex_if_in_cs:TF` Right braces are special only directly inside control sequences (at the inner-most level of nesting, not counting groups).

```

4863 \cs_new:Npn \_regex_if_in_cs:TF
4864 {
4865   \if_int_odd:w \l__regex_mode_int
4866   \else:
4867     \if_int_compare:w \l__regex_mode_int < \c__regex_outer_mode_int
4868     \exp_after:wN \exp_after:wN \exp_after:wN \use_ii:nnn
4869     \fi:
4870   \fi:
4871   \use_ii:nn
4872 }

```

*(End of definition for \\_regex\_if\_in\_cs:TF.)*

`\_regex_if_in_class_or_catcode:TF` Assertions are only allowed in modes 0, -2, and -6, i.e., even, non-positive modes.

```

4873 \cs_new:Npn \_regex_if_in_class_or_catcode:TF
4874 {
4875   \if_int_odd:w \l__regex_mode_int
4876   \else:
4877     \if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
4878     \else:
4879       \exp_after:wN \exp_after:wN \exp_after:wN \use_iii:nnn
4880       \fi:
4881     \fi:
4882     \use_i:nn
4883 }

```

*(End of definition for \\_regex\_if\_in\_class\_or\_catcode:TF.)*

`\_regex_if_within_catcode:TF` This test takes the true branch if we are in a catcode test, either immediately following it (modes 2 and 6) or in a class on which it applies (modes 23 and 63). This is used to tweak how left brackets behave in modes 2 and 6.

```

4884 \prg_new_conditional:Npnn \_regex_if_within_catcode: { TF }
4885 {
4886   \if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
4887   \prg_return_true:
4888   \else:
4889     \prg_return_false:
4890   \fi:
4891 }

```

(End of definition for `\__regex_if_within_catcode:TF`.)

`\__regex_chk_c_allowed:T` The `\c` escape sequence is only allowed in modes 0 and 3, i.e., not within any other `\c` escape sequence.

```

4892 \cs_new_protected:Npn \__regex_chk_c_allowed:T
4893 {
4894   \if_int_compare:w \l__regex_mode_int = \c__regex_outer_mode_int
4895   \else:
4896     \if_int_compare:w \l__regex_mode_int = \c__regex_class_mode_int
4897     \else:
4898       \msg_error:nn { regex } { c-bad-mode }
4899       \exp_after:wN \use_i:nnn
4900     \fi:
4901   \fi:
4902   \use:n
4903 }

```

(End of definition for `\__regex_chk_c_allowed:T`.)

`\__regex_mode_quit:c:` This function changes the mode as it is needed just after a catcode test.

```

4904 \cs_new_protected:Npn \__regex_mode_quit:c:
4905 {
4906   \if_int_compare:w \l__regex_mode_int = \c__regex_catcode_mode_int
4907   \int_set_eq:NN \l__regex_mode_int \c__regex_outer_mode_int
4908   \else:
4909     \if_int_compare:w \l__regex_mode_int =
4910     \c__regex_catcode_in_class_mode_int
4911     \int_set_eq:NN \l__regex_mode_int \c__regex_class_mode_int
4912   \fi:
4913   \fi:
4914 }

```

(End of definition for `\__regex_mode_quit:c:`.)

### 49.3.4 Framework

`\__regex_compile:w` Used when compiling a user regex or a regex for the `\c{...}` escape sequence within  
`\__regex_compile_end:` another regex. Start building a token list within a group (with e-expansion at the outset), and set a few variables (group level, catcodes), then start the first branch. At the end, make sure there are no dangling classes nor groups, close the last branch: we are done building `\l__regex_tmp_regex`.

```

4915 \cs_new_protected:Npn \__regex_compile:w
4916 {
4917   \group_begin:
4918     \tl_build_begin:N \l__regex_build_tl

4960 }

```

(End of definition for \\_\_regex\_compile:w and \\_\_regex\_compile\_end:.)

\\_\_regex\_compile:n The compilation is done between \\_\_regex\_compile:w and \\_\_regex\_compile\_end:, starting in mode 0. Then \\_\_regex\_escape\_use:nnnn distinguishes special characters, escaped alphanumerics, and raw characters, interpreting \a, \x and other sequences. The 4 trailing \prg\_do\_nothing: are needed because some functions defined later look up to 4 tokens ahead. Before ending, make sure that any \c{...} is properly closed. No need to check that brackets are closed properly since \\_\_regex\_compile\_end: does that. However, catch the case of a trailing \cL construction.

```

4961 \cs_new_protected:Npn \__regex_compile:n #1
4962 {
4963   \__regex_compile:w
4964   \__regex_standard_escapechar:
4965   \int_set_eq:NN \l__regex_mode_int \c__regex_outer_mode_int
4966   \__regex_escape_use:nnnn
4967   {
4968     \__regex_char_if_special:NTF ##1
4969     \__regex_compile_special:N \__regex_compile_raw:N ##1
4970   }
4971   {

```

```

4972         \_regex_char_if_alphanumeric:NTF ##1
4973         \_regex_compile_escaped:N \_regex_compile_raw:N ##1
4974     }
4975     { \_regex_compile_raw:N ##1 }
4976     { #1 }
4977     \prg_do_nothing: \prg_do_nothing:
4978     \prg_do_nothing: \prg_do_nothing:
4979     \int_compare:nNnT \l__regex_mode_int = \c__regex_catcode_mode_int
4980     { \msg_error:nn { regex } { c-trailing } }
4981     \int_compare:nNnT \l__regex_mode_int < \c__regex_outer_mode_int
4982     {
4983         \msg_error:nn { regex } { c-missing-rbrace }
4984         \_regex_compile_end_cs:
4985         \prg_do_nothing: \prg_do_nothing:
4986         \prg_do_nothing: \prg_do_nothing:
4987     }
4988     \_regex_compile_end:
4989 }

```

*(End of definition for \\_regex\_compile:n.)*

`\_regex_compile_use:n` Use a regex, regardless of whether it is given as a string (in which case we need to compile) or as a regex variable. This is used for `\regex_match_case:nn` and related functions to allow a mixture of explicit regex and regex variables.

```

4990 \cs_new_protected:Npn \_regex_compile_use:n #1
4991 {
4992     \tl_if_single_token:nT {#1}
4993     {
4994         \exp_after:wN \_regex_compile_use_aux:w
4995         \token_to_meaning:N #1 ~ \q__regex_nil
4996     }
4997     \_regex_compile:n {#1} \l__regex_tmp_regex
4998 }
4999 \cs_new_protected:Npn \_regex_compile_use_aux:w #1 ~ #2 \q__regex_nil
5000 {
5001     \str_if_eq:nnT { #1 ~ } { macro:->\_regex_branch:n }
5002     { \use_ii:nnn }
5003 }

```

*(End of definition for \\_regex\_compile\_use:n.)*

`\_regex_compile_escaped:N` If the special character or escaped alphanumeric has a particular meaning in regexes, the corresponding function is used. Otherwise, it is interpreted as a raw character. We distinguish special characters from escaped alphanumeric characters because they behave differently when appearing as an end-point of a range.

`\_regex_compile_special:N`

```

5004 \cs_new_protected:Npn \_regex_compile_special:N #1
5005 {
5006     \cs_if_exist_use:cF { __regex_compile_#1: }
5007     { \_regex_compile_raw:N #1 }
5008 }
5009 \cs_new_protected:Npn \_regex_compile_escaped:N #1
5010 {
5011     \cs_if_exist_use:cF { __regex_compile_/#1: }
5012     { \_regex_compile_raw:N #1 }
5013 }

```

(End of definition for `\__regex_compile_escaped:N` and `\__regex_compile_special:N`)

`\__regex_compile_one:n` This is used after finding one “test”, such as `\d`, or a raw character. If that followed a catcode test (e.g., `\cL`), then restore the mode. If we are not in a class, then the test is “standalone”, and we need to add `\__regex_class:NnnnN` and search for quantifiers. In any case, insert the test, possibly together with a catcode test if appropriate.

```

5014 \cs_new_protected:Npn \__regex_compile_one:n #1
5015 {
5016   \__regex_mode_quit_c:
5017   \__regex_if_in_class:TF { }
5018   {
5019     \tl_build_put_right:Nn \l__regex_build_tl
5020     { \__regex_class:NnnnN \c_true_bool { \if_false: } \fi: }
5021   }
5022   \tl_build_put_right:Ne \l__regex_build_tl
5023   {
5024     \if_int_compare:w \l__regex_catcodes_int <
5025     \c__regex_all_catcodes_int
5026     \__regex_item_catcode:nT { \int_use:N \l__regex_catcodes_int }
5027     { \exp_not:N \exp_not:n {#1} }
5028     \else:
5029     \exp_not:N \exp_not:n {#1}
5030     \fi:
5031   }
5032   \int_set_eq:NN \l__regex_catcodes_int \l__regex_default_catcodes_int
5033   \__regex_if_in_class:TF { } { \__regex_compile_quantifier:w }
5034 }

```

(End of definition for `\__regex_compile_one:n`)

`\__regex_compile_abort_tokens:n` This function places the collected tokens back in the input stream, each as a raw character. Spaces are not preserved.

```

5035 \cs_new_protected:Npn \__regex_compile_abort_tokens:n #1
5036 {
5037   \use:e
5038   {
5039     \exp_args:No \tl_map_function:nN { \tl_to_str:n {#1} }
5040     \__regex_compile_raw:N
5041   }
5042 }
5043 \cs_generate_variant:Nn \__regex_compile_abort_tokens:n { e }

```

(End of definition for `\__regex_compile_abort_tokens:n`)

### 49.3.5 Quantifiers

`\__regex_compile_if_quantifier:TFw` This looks ahead and checks whether there are any quantifier (special character equal to either of `?+*{}`). This is useful for the `\u` and `\ur` escape sequences.

```

5044 \cs_new_protected:Npn \__regex_compile_if_quantifier:TFw #1#2#3#4
5045 {
5046   \token_if_eq_meaning:NNTF #3 \__regex_compile_special:N
5047   { \cs_if_exist:cTF { __regex_compile_quantifier_#4:w } }
5048   { \use_ii:nn }
5049   {#1} {#2} #3 #4

```

```
5050 }
```

*(End of definition for \\_regex\_compile\_if\_quantifier:TFw.)*

\\_regex\_compile\_quantifier:w This looks ahead and finds any quantifier (special character equal to either of ?+\*{).

```
5051 \cs_new_protected:Npn \_regex_compile_quantifier:w #1#2
5052 {
5053   \token_if_eq_meaning:NNTF #1 \_regex_compile_special:N
5054   {
5055     \cs_if_exist_use:cF { \_regex_compile_quantifier_#2:w }
5056     { \_regex_compile_quantifier_none: #1 #2 }
5057   }
5058   { \_regex_compile_quantifier_none: #1 #2 }
5059 }
```

*(End of definition for \\_regex\_compile\_quantifier:w.)*

\\_regex\_compile\_quantifier\_none: Those functions are called whenever there is no quantifier, or a braced construction is invalid (equivalent to no quantifier, and whatever characters were grabbed are left raw).

\\_regex\_compile\_quantifier\_abort:eNN

```
5060 \cs_new_protected:Npn \_regex_compile_quantifier_none:
5061 {
5062   \tl_build_put_right:Nn \l__regex_build_tl
5063   { \if_false: { \fi: } { 1 } { 0 } \c_false_bool }
5064 }
5065 \cs_new_protected:Npn \_regex_compile_quantifier_abort:eNN #1#2#3
5066 {
5067   \_regex_compile_quantifier_none:
5068   \msg_warning:nnee { regex } { invalid-quantifier } {#1} {#3}
5069   \_regex_compile_abort_tokens:e {#1}
5070   #2 #3
5071 }
```

*(End of definition for \\_regex\_compile\_quantifier\_none: and \\_regex\_compile\_quantifier\_abort:eNN.)*

\\_regex\_compile\_quantifier\_laziness:nnNN

Once the “main” quantifier (?, \*, + or a braced construction) is found, we check whether it is lazy (followed by a question mark). We then add to the compiled regex a closing brace (ending \\_regex\_class:NnnnN and friends), the start-point of the range, its end-point, and a boolean, true for lazy and false for greedy operators.

```
5072 \cs_new_protected:Npn \_regex_compile_quantifier_laziness:nnNN #1#2#3#4
5073 {
5074   \_regex_two_if_eq:NNNTF #3 #4 \_regex_compile_special:N ?
5075   {
5076     \tl_build_put_right:Nn \l__regex_build_tl
5077     { \if_false: { \fi: } { #1 } { #2 } \c_true_bool }
5078   }
5079   {
5080     \tl_build_put_right:Nn \l__regex_build_tl
5081     { \if_false: { \fi: } { #1 } { #2 } \c_false_bool }
5082     #3 #4
5083   }
5084 }
```

*(End of definition for \\_regex\_compile\_quantifier\_laziness:nnNN.)*

For each “basic” quantifier, `?`, `*`, `+`, feed the correct arguments to `\__regex_compile_quantifier_laziness:nnNN`, `-1` means that there is no upper bound on the number of repetitions.

```

5085 \cs_new_protected:cpn { __regex_compile_quantifier?:w }
5086   { \__regex_compile_quantifier_laziness:nnNN { 0 } { 1 } }
5087 \cs_new_protected:cpn { __regex_compile_quantifier*:w }
5088   { \__regex_compile_quantifier_laziness:nnNN { 0 } { -1 } }
5089 \cs_new_protected:cpn { __regex_compile_quantifier+:w }
5090   { \__regex_compile_quantifier_laziness:nnNN { 1 } { -1 } }

```

(End of definition for `\__regex_compile_quantifier?:w`, `\__regex_compile_quantifier*:w`, and `\__regex_compile_quantifier+:w`.)

```

\__regex_compile_quantifier_{:w
\__regex_compile_quantifier_braced_auxi:w
\__regex_compile_quantifier_braced_auxii:w
\__regex_compile_quantifier_braced_auxiii:w

```

Three possible syntaxes: `{⟨int⟩}`, `{⟨int⟩,}`, or `{⟨int⟩,⟨int⟩}`. Any other syntax causes us to abort and put whatever we collected back in the input stream, as `raw` characters, including the opening brace. Grab a number into `\l__regex_tmpa_int`. If the number is followed by a right brace, the range is  $[a, a]$ . If followed by a comma, grab one more number, and call the `_ii` or `_iii` auxiliary. Those auxiliaries check for a closing brace, leading to the range  $[a, \infty]$  or  $[a, b]$ , encoded as `{a}{-1}` and `{a}{b-a}`.

```

5091 \cs_new_protected:cpn { __regex_compile_quantifier_ \c_left_brace_str :w }

5157     #1 #2
5158 }

```

(End of definition for \\_\_regex\_compile\_quantifier\_{:w and others.)

### 49.3.6 Raw characters

\\_\_regex\_compile\_raw\_error:N Within character classes, and following catcode tests, some escaped alphanumeric sequences such as \b do not have any meaning. They are replaced by a raw character, after spitting out an error.

```

5159 \cs_new_protected:Npn \__regex_compile_raw_error:N #1
5160 {
5161     \msg_error:nne { regex } { bad-escape } {#1}
5162     \__regex_compile_raw:N #1
5163 }

```

(End of definition for \\_\_regex\_compile\_raw\_error:N.)

\\_\_regex\_compile\_raw:N If we are in a character class and the next character is an unescaped dash, this denotes a range. Otherwise, the current character #1 matches itself.

```

5164 \cs_new_protected:Npn \__regex_compile_raw:N #1#2#3
5165 {
5166     \__regex_if_in_class:TF

```

```

5167     {
5168         \_regex_two_if_eq:NNNTF #2 #3 \_regex_compile_special:N -
5169         { \_regex_compile_range:Nw #1 }
5170         {
5171             \_regex_compile_one:n

5224 }

```

(End of definition for `\__regex_compile_range:Nw` and `\__regex_if_end_range:NNTF`.)

### 49.3.7 Character properties

`\__regex_compile_.`: In a class, the dot has no special meaning. Outside, insert `\__regex_prop_.`, which matches any character or control sequence, and refuses `-2` (end-marker).

```

5225 \cs_new_protected:cpe { __regex_compile_.: }
5226 {
5227     \exp_not:N \__regex_if_in_class:TF
5228     { \__regex_compile_raw:N . }
5229     { \__regex_compile_one:n \exp_not:c { __regex_prop_.: } }
5230 }
5231 \cs_new_protected:cpn { __regex_prop_.: }
5232 {
5233     \if_int_compare:w \l__regex_curr_char_int > - 2 \exp_stop_f:
5234     \exp_after:wN \__regex_break_true:w
5235     \fi:
5236 }

```

(End of definition for `\__regex_compile_.` and `\__regex_prop_.`.)

`\__regex_compile_/d:` The constants `\__regex_prop_d:`, etc. hold a list of tests which match the corresponding character class, and jump to the `\__regex_break_point:TF` marker. As for a normal character, we check for quantifiers.

```

5237 \cs_set_protected:Npn \__regex_tmp:w #1#2
5238 {
5239     \cs_new_protected:cpe { __regex_compile_/#1: }
5240     { \__regex_compile_one:n \exp_not:c { __regex_prop_#1: } }
5241     \cs_new_protected:cpe { __regex_compile_/#2: }
5242     {
5243         \__regex_compile_one:n
5244         { \__regex_item_reverse:n { \exp_not:c { __regex_prop_#1: } } }
5245     }
5246 }
5247 \__regex_tmp:w d D
5248 \__regex_tmp:w h H
5249 \__regex_tmp:w s S
5250 \__regex_tmp:w v V
5251 \__regex_tmp:w w W
5252 \cs_new_protected:cpn { __regex_compile_/N: }
5253 { \__regex_compile_one:n \__regex_prop_N: }

```

(End of definition for `\__regex_compile_/d:` and others.)

### 49.3.8 Anchoring and simple assertions

`__regex_compile_anchor_letter:NNN` In modes where assertions are forbidden, anchors such as `\A` produce an error (`\A` is invalid in classes); otherwise they add an `__regex_assertion:Nn` test as appropriate (the only negative assertion is `\B`). The test functions are defined later. The implementation for `$` and `^` is only different from `\A` etc because these are valid in a class.

```

5254 \cs_new_protected:Npn __regex_compile_anchor_letter:NNN #1#2#3
5255 {
5256   __regex_if_in_class_or_catcode:TF { __regex_compile_raw_error:N #1 }
5257   {
5258     \tl_build_put_right:Nn \l__regex_build_tl
5259     { __regex_assertion:Nn #2 {#3} }
5260   }
5261 }
5262 \cs_new_protected:cpn { __regex_compile_/A: }
5263 { __regex_compile_anchor_letter:NNN A \c_true_bool __regex_A_test: }
5264 \cs_new_protected:cpn { __regex_compile_/G: }
5265 { __regex_compile_anchor_letter:NNN G \c_true_bool __regex_G_test: }
5266 \cs_new_protected:cpn { __regex_compile_/Z: }
5267 { __regex_compile_anchor_letter:NNN Z \c_true_bool __regex_Z_test: }
5268 \cs_new_protected:cpn { __regex_compile_/z: }
5269 { __regex_compile_anchor_letter:NNN z \c_true_bool __regex_Z_test: }
5270 \cs_new_protected:cpn { __regex_compile_/b: }
5271 { __regex_compile_anchor_letter:NNN b \c_true_bool __regex_b_test: }
5272 \cs_new_protected:cpn { __regex_compile_/B: }
5273 { __regex_compile_anchor_letter:NNN B \c_false_bool __regex_b_test: }
5274 \cs_set_protected:Npn __regex_tmp:w #1#2
5275 {
5276   \cs_new_protected:cpn { __regex_compile_#1: }
5277   {
5278     __regex_if_in_class_or_catcode:TF { __regex_compile_raw:N #1 }
5279     {
5280       \tl_build_put_right:Nn \l__regex_build_tl
5281       { __regex_assertion:Nn \c_true_bool {#2} }
5282     }
5283   }
5284 }
5285 \exp_args:Ne __regex_tmp:w { \iow_char:N ^ } { __regex_A_test: }
5286 \exp_args:Ne __regex_tmp:w { \iow_char:N $ } { __regex_Z_test: }

```

(End of definition for `__regex_compile_anchor_letter:NNN` and others.)

### 49.3.9 Character classes

`__regex_compile_]:` Outside a class, right brackets have no meaning. In a class, change the mode ( $m \rightarrow (m - 15)/13$ , truncated) to reflect the fact that we are leaving the class. Look for quantifiers, unless we are still in a class after leaving one (the case of `[... \cL[...] ...]`). quantifiers.

```

5287 \cs_new_protected:cpn { __regex_compile_]: }
5288 {
5289   __regex_if_in_class:TF
5290   {
5291     \if_int_compare:w \l__regex_mode_int >
5292     \c_regex_catcode_in_class_mode_int
5293     \tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } }

```

```

5294     \fi:
5295     \tex_advance:D \l__regex_mode_int - 15 \exp_stop_f:
5296     \tex_divide:D \l__regex_mode_int 13 \exp_stop_f:
5297     \if_int_odd:w \l__regex_mode_int \else:
5298         \exp_after:wN \__regex_compile_quantifier:w
5299     \fi:
5300 }
5301 { \__regex_compile_raw:N ] }
5302 }

```

(End of definition for \\_\_regex\_compile[:])

\\_\_regex\_compile[: In a class, left brackets might introduce a POSIX character class, or mean nothing. Immediately following \c<category>, we must insert the appropriate catcode test, then parse the class; we pre-expand the catcode as an optimization. Otherwise (modes 0, -2 and -6) just parse the class. The mode is updated later.

```

5303 \cs_new_protected:cpn { \__regex_compile[: }
5304 {
5305     \__regex_if_in_class:TF
5306     { \__regex_compile_class_posix_test:w }
5307     {
5308         \__regex_if_within_catcode:TF
5309         {
5310             \exp_after:wN \__regex_compile_class_catcode:w
5311             \int_use:N \l__regex_catcodes_int \__regex_sep:
5312         }
5313         { \__regex_compile_class_normal:w }
5314     }
5315 }

```

(End of definition for \\_\_regex\_compile[:])

\\_\_regex\_compile\_class\_normal:w In the “normal” case, we insert \\_\_regex\_class:NnnnN <boolean> in the compiled code. The <boolean> is true for positive classes, and false for negative classes, characterized by a leading ~. The auxiliary \\_\_regex\_compile\_class:TFNN also checks for a leading ] which has a special meaning.

```

5316 \cs_new_protected:Npn \__regex_compile_class_normal:w
5317 {
5318     \__regex_compile_class:TFNN
5319     { \__regex_class:NnnnN \c_true_bool }
5320     { \__regex_class:NnnnN \c_false_bool }
5321 }

```

(End of definition for \\_\_regex\_compile\_class\_normal:w.)

\\_\_regex\_compile\_class\_catcode:w This function is called for a left bracket in modes 2 or 6 (catcode test, and catcode test within a class). In mode 2 the whole construction needs to be put in a class (like single character). Then determine if the class is positive or negative, inserting \\_\_regex\_item\_catcode:nT or the reverse variant as appropriate, each with the current catcodes bitmap #1 as an argument, and reset the catcodes.

```

5322 \cs_new_protected:Npn \__regex_compile_class_catcode:w #1 \__regex_sep:
5323 {
5324     \if_int_compare:w \l__regex_mode_int = \c__regex_catcode_mode_int
5325         \tl_build_put_right:Nn \l__regex_build_tl

```

```

5326         { \_regex_class:NnnnN \c_true_bool { \if_false: } \fi: }
5327     \fi:
5328     \int_set_eq:NN \l__regex_catcodes_int \l__regex_default_catcodes_int
5329     \_regex_compile_class:TFNN
5330     { \_regex_item_catcode:nT {#1} }
5331     { \_regex_item_catcode_reverse:nT {#1} }
5332 }

```

(End of definition for \\_regex\_compile\_class\_catcode:w.)

\\_regex\_compile\_class:TFNN If the first character is ^, then the class is negative (use #2), otherwise it is positive (use  
\\_regex\_compile\_class:NN #1). If the next character is a right bracket, then it should be changed to a raw one.

```

5333 \cs_new_protected:Npn \_regex_compile_class:TFNN #1#2#3#4
5334 {
5335     \l__regex_mode_int = \int_value:w \l__regex_mode_int 3 \exp_stop_f:
5336     \_regex_two_if_eq:NNNTF #3 #4 \_regex_compile_special:N ^
5337     {
5338         \tl_build_put_right:Nn \l__regex_build_tl { #2 { \if_false: } \fi: }
5339         \_regex_compile_class:NN
5340     }
5341     {
5342         \tl_build_put_right:Nn \l__regex_build_tl { #1 { \if_false: } \fi: }
5343         \_regex_compile_class:NN #3 #4
5344     }
5345 }
5346 \cs_new_protected:Npn \_regex_compile_class:NN #1#2
5347 {
5348     \token_if_eq_charcode:NNTF #2 ]
5349     { \_regex_compile_raw:N #2 }
5350     { #1 #2 }
5351 }

```

(End of definition for \\_regex\_compile\_class:TFNN and \\_regex\_compile\_class:NN.)

\\_regex\_compile\_class\_posix\_test:w Here we check for a syntax such as [:alpha:]. We also detect [= and [. which have a  
\\_regex\_compile\_class\_posix:NNNNw meaning in POSIX regular expressions, but are not implemented in l3regex. In case we  
\\_regex\_compile\_class\_posix\_loop:w see [:, grab raw characters until hopefully reaching :]. If that's missing, or the POSIX  
\\_regex\_compile\_class\_posix\_end:w class is unknown, abort. If all is right, add the test to the current class, with an extra  
\\_regex\_item\_reverse:n for negative classes (we make sure to wrap its argument in  
braces otherwise \regex\_show:N would not recognize the regex as valid).

```

5352 \cs_new_protected:Npn \_regex_compile_class_posix_test:w #1#2
5353 {
5354     \token_if_eq_meaning:NNT \_regex_compile_special:N #1
5355     {

### 49.3.10 Groups and alternations

```

\__regex_compile_group_begin:N
\__regex_compile_group_end:

```

The contents of a regex group are turned into compiled code in `\l__regex_build_tl`, which ends up with items of the form `\__regex_branch:n {⟨concatenation⟩}`. This construction is done using `\tl_build_...` functions within a T<sub>E</sub>X group, which automatically makes sure that options (case-sensitivity and default catcode) are reset at the end of the group. The argument #1 is `\__regex_group:nnnN` or a variant thereof. A small subtlety to support `\cL(abc)` as a shorthand for `(\cLa\cLb\cLc)`: exit any pending catcode test, save the category code at the start of the group as the default catcode for that group, and make sure that the catcode is restored to the default outside the group.

```

5422 \cs_new_protected:Npn \__regex_compile_group_begin:N #1
5423 {
5424   \tl_build_put_right:Nn \l__regex_build_tl { #1 { \if_false: } \fi: }
5425   \__regex_mode_quit_c:
5426   \group_begin:
5427     \tl_build_begin:N \l__regex_build_tl
5428     \int_set_eq:NN \l__regex_default_catcodes_int \l__regex_catcodes_int
5429     \int_incr:N \l__regex_group_level_int
5430     \tl_build_put_right:Nn \l__regex_build_tl
5431       { \__regex_branch:n { \if_false: } \fi: }
5432   }
5433 \cs_new_protected:Npn \__regex_compile_group_end:

### 49.3.11 Catcodes and csnames

\\_\_regex\_compile\_/c:  
 \\_\_regex\_compile\_c\_test:NN

The \c escape sequence can be followed by a capital letter representing a character category, by a left bracket which starts a list of categories, or by a brace group holding a regular expression for a control sequence name. Otherwise, raise an error.

```

5532 \cs_new_protected:cpn { __regex_compile_/c: }

```

```

5533 { \_regex_chk_c_allowed:T { \_regex_compile_c_test:NN } }
5534 \cs_new_protected:Npn \_regex_compile_c_test:NN #1#2
5535 {
5536   \token_if_eq_meaning:NNTF #1 \_regex_compile_raw:N
5537   {
5538     \int_if_exist:cTF { c\_regex_catcode_#2_int }
5539     {
5540       \int_set_eq:Nc \l\_regex_catcodes_int
5541       { c\_regex_catcode_#2_int }
5542       \l\_regex_mode_int
5543       = \if_case:w \l\_regex_mode_int
5544         \c\_regex_catcode_mode_int
5545         \else:
5546           \c\_regex_catcode_in_class_mode_int
5547         \fi:
5548       \token_if_eq_charcode:NNT C #2 { \_regex_compile_c_C:NN }
5549     }
5550   }
5551   { \cs_if_exist_use:cF { __regex_compile_c_#2:w } }
5552   {
5553     \msg_error:nne { regex } { c-missing-category } {#2}
5554     #1 #2
5555   }
5556 }

```

(End of definition for \\_regex\_compile\_/c: and \\_regex\_compile\_c\_test:NN.)

\\_regex\_compile\_c\_C:NN If \cC is not followed by . or (...) then complain because that construction cannot match anything, except in cases like \cC[\c{...}], where it has no effect.

```

5557 \cs_new_protected:Npn \_regex_compile_c_C:NN #1#2
5558 {
5559   \token_if_eq_meaning:NNTF #1 \_regex_compile_special:N

5623 }

```

(End of definition for `\__regex_compile_c[:w` and others.)

`\__regex_compile_c_{`: The case of a left brace is easy, based on what we have done so far: in a group, compile the regular expression, after changing the mode to forbid nesting `\c`. Additionally, disable submatch tracking since groups don't escape the scope of `\c{...}`.

```

5624 \cs_new_protected:cpn { __regex_compile_c_ \c_left_brace_str :w }

```

```

5625 {
5626   \__regex_compile:w
5627   \__regex_disable_submatches:
5628   \l__regex_mode_int
5629   = \if_case:w \l__regex_mode_int
5630     \c__regex_cs_mode_int
5631   \else:
5632     \c__regex_cs_in_class_mode_int
5633   \fi:
5634 }

```

(End of definition for \\_\_regex\_compile\_c{:.})

\\_\_regex\_compile\_{: We forbid unescaped left braces inside a \c{...} escape because they otherwise lead to the confusing question of whether the first right brace in \c{{}x} should end \c or whether one should match braces.

```

5635 \cs_new_protected:cpn { __regex_compile_ \c_left_brace_str : }
5636 {
5637   \__regex_if_in_cs:TF
5638   { \msg_error:nnn { regex } { cu-lbrace } { c } }
5639   { \exp_after:wN \__regex_compile_raw:N \c_left_brace_str }
5640 }

```

(End of definition for \\_\_regex\_compile\_{:.})

\l\_\_regex\_cs\_flag Non-escaped right braces are only special if they appear when compiling the regular expression for a csname, but not within a class: \c{[{}]} matches the control sequences \{ and \}. So, end compiling the inner regex (this closes any dangling class or group). Then insert the corresponding test in the outer regex. As an optimization, if the control sequence test simply consists of several explicit possibilities (branches) then use \\_\_regex\_item\_exact\_cs:n with an argument consisting of all possibilities separated by \scan\_stop:.

### 49.3.12 Raw token lists with \u

\\_\_regex\_compile\_/u: The \u escape is invalid in classes and directly following a catcode test. Otherwise test for a following r (for \ur), and call an auxiliary responsible for finding the variable name.

```

5706 \cs_new_protected:cpn { __regex_compile_/u: } #1#2
5707 {
5708     \__regex_if_in_class_or_catcode:TF
5709     { \__regex_compile_raw_error:N u #1 #2 }

```

```

5710     {
5711         \_regex_two_if_eq:NNNTF #1 #2 \_regex_compile_raw:N r
5712         { \_regex_compile_u_brace:NNN \_regex_compile_ur_end: }
5713         { \_regex_compile_u_brace:NNN \_regex_compile_u_end: #1 #2 }
5714     }
5715 }

```

(End of definition for \\_regex\_compile\_/u:.)

\\_regex\_compile\_u\_brace:NNN This enforces the presence of a left brace, then starts a loop to find the variable name.

```

5716 \cs_new:Npn \_regex_compile_u_brace:NNN #1#2#3
5717 {
5718     \_regex_two_if_eq:NNNTF #2 #3 \_regex_compile_special:N \c_left_brace_str
5719     {
5720         \tl_set:Nn \l_regex_tmpb_tl {#1}
5721         \_kernel_tl_set:Nx \l_regex_tmpa_tl { \if_false: } \fi:
5722         \_regex_compile_u_loop:NN
5723     }
5724     {
5725         \msg_error:nn { regex } { u-missing-lbrace }
5726         \token_if_eq_meaning:NNTF #1 \_regex_compile_ur_end:
5727         { \_regex_compile_raw:N u \_regex_compile_raw:N r }
5728         { \_regex_compile_raw:N u }
5729         #2 #3
5730     }
5731 }

```

(End of definition for \\_regex\_compile\_u\_brace:NNN.)

\\_regex\_compile\_u\_loop:NN We collect the characters for the argument of \u within an e-expanding assignment. In principle we could just wait to encounter a right brace, but this is unsafe: if the right brace was missing, then we would reach the end-markers of the regex, and continue, leading to obscure fatal errors. Instead, we only allow raw and special characters, and stop when encountering a special right brace, any escaped character, or the end-marker.

```

5732 \cs_new:Npn \_regex_compile_u_loop:NN #1#2
5733 {
5734     \token_if_eq_meaning:NNTF #1 \_regex_compile_raw:N
5735     { #2 \_regex_compile_u_loop:NN }
5736     {

### 49.3.13 Other

\\_regex\_compile\_/K: The \K control sequence is currently the only “command”, which performs some action, rather than matching something. It is allowed in the same contexts as \b. At the compilation stage, we leave it as a single control sequence, defined later.

```

5842 \cs_new_protected:cpn { \_regex_compile_/K: }
5843 {
5844     \int_compare:nNnTF \l__regex_mode_int = \c__regex_outer_mode_int
5845     { \tl_build_put_right:Nn \l__regex_build_tl { \_regex_command_K: } }
5846     { \_regex_compile_raw_error:N K }
5847 }

```

(End of definition for \\_regex\_compile\_/K:.)

### 49.3.14 Showing regexes

Before showing a regex we check that it is “clean” in the sense that it has the correct internal structure. We do this (in the implementation of \regex\_show:N and \regex\_log:N) by comparing it with a cleaned-up version of the same regex. Along the way we also need similar functions for other types: all \\_regex\_clean\_⟨type⟩:n functions produce valid ⟨type⟩ tokens (bool, explicit integer, etc.) from arbitrary input, and the output coincides with the input if that was valid.

```

5848 \cs_new:Npn \_regex_clean_bool:n #1

```

*(End of definition for \\_\_regex\_show\_one:n.)*

`\__regex_show_push:n` Enter and exit levels of nesting. The `scope` function prints its first argument as an “introduction”, then performs its second argument in a deeper level of nesting.  
`\__regex_show_pop:`  
`\__regex_show_scope:nn`

```

6080 \cs_new_protected:Npn \__regex_show_push:n #1
6081 { \seq_put_right:Ne \l__regex_show_prefix_seq { #1 ~ } }
6082 \cs_new_protected:Npn \__regex_show_pop:
6083 { \seq_pop_right:NN \l__regex_show_prefix_seq \l__regex_tmpa_tl }
6084 \cs_new_protected:Npn \__regex_show_scope:nn #1#2
6085 {
6086   \__regex_show_one:n {#1}
6087   \__regex_show_push:n { ~ }
6088   #2
6089   \__regex_show_pop:
6090 }

```

*(End of definition for \\_\_regex\_show\_push:n, \\_\_regex\_show\_pop:, and \\_\_regex\_show\_scope:nn.)*

`\__regex_show_group_aux:nnnnN` We display all groups in the same way, simply adding a message, (no capture) or (resetting), to special groups. The odd `\use_ii:nn` avoids printing a spurious `+-branch` for the first branch.

```

6091 \cs_new_protected:Npn \__regex_show_group_aux:nnnnN #1#2#3#4#5
6092 {
6093   \__regex_show_one:n { , -group~begin #1 }
6094   \__regex_show_push:n { | }
6095   \use_ii:nn #2
6096   \__regex_show_pop:
6097   \__regex_show_one:n
6098   { ‘-group~end \__regex_msg_repeated:nnN {#3} {#4} #5 }
6099 }

```

*(End of definition for \\_\_regex\_show\_group\_aux:nnnnN.)*

`\__regex_show_class:NnnnN`

I'm entirely unhappy about this function: I couldn't find a way to test if a class is a single test. Instead, collect the representation of the tests in the class. If that had more than one line, write `Match` or `Don't match` on its own line, with the repeating information if any. Then the various tests on lines of their own, and finally a line. Otherwise, we need to evaluate the representation of the tests again (since the prefix is incorrect). That's clunky, but not too expensive, since it's only one test.

```
6100 \cs_new:Npn \__regex_show_class:NnnnN #1#2#3#4#5
6101 {
6102   \group_begin:
6103     \tl_build_begin:N \l__regex_build_tl

6154   \__regex_show_one:n
6155     { control~sequence~ \seq_use:Nn \l__regex_tmp_seq { ~or~ } }
6156 }

```

(End of definition for `\__regex_show_item_exact_cs:n.`)

## 49.4 Building

### 49.4.1 Variables used while building

`\l__regex_min_state_int` The last state that was allocated is `\l__regex_max_state_int - 1`, so that `\l__regex_max_state_int` always points to a free state. The `min_state` variable is 1 to begin with, but gets shifted in nested calls to the matching code, namely in `\c{...}` constructions.

```

6157 \int_new:N \l__regex_min_state_int
6158 \int_set:Nn \l__regex_min_state_int { 1 }
6159 \int_new:N \l__regex_max_state_int

```

(End of definition for `\l__regex_min_state_int` and `\l__regex_max_state_int.`)

`\l__regex_left_state_int` Alternatives are implemented by branching from a `left` state into the various choices, then merging those into a `right` state. We store information about those states in two sequences. Those states are also used to implement group quantifiers. Most often, the left and right pointers only differ by 1.

```

6160 \int_new:N \l__regex_left_state_int
6161 \int_new:N \l__regex_right_state_int
6162 \seq_new:N \l__regex_left_state_seq
6163 \seq_new:N \l__regex_right_state_seq

```

(End of definition for `\l__regex_left_state_int` and others.)

`\l__regex_capturing_group_int`

`\l__regex_capturing_group_int` is the next ID number to be assigned to a capturing group. This starts at 0 for the group enclosing the full regular expression, and groups are counted in the order of their left parenthesis, except when encountering `resetting` groups.

```

6164 \int_new:N \l__regex_capturing_group_int

```

(End of definition for `\l__regex_capturing_group_int.`)

## 49.4.2 Framework

This phase is about going from a compiled regex to an NFA. Each state of the NFA is stored in a `\toks`. The operations which can appear in the `\toks` are

- `\_regex_action_start_wildcard:N`  $\langle \text{boolean} \rangle$  inserted at the start of the regular expression, where a `true`  $\langle \text{boolean} \rangle$  makes it unanchored.
- `\_regex_action_success:` marks the exit state of the NFA.
- `\_regex_action_cost:n`  $\{ \langle \text{shift} \rangle \}$  is a transition from the current  $\langle \text{state} \rangle$  to  $\langle \text{state} \rangle + \langle \text{shift} \rangle$ , which consumes the current character: the target state is saved and will be considered again when matching at the next position.
- `\_regex_action_free:n`  $\{ \langle \text{shift} \rangle \}$ , and `\_regex_action_free_group:n`  $\{ \langle \text{shift} \rangle \}$  are free transitions, which immediately perform the actions for the state  $\langle \text{state} \rangle + \langle \text{shift} \rangle$  of the NFA. They differ in how they detect and avoid infinite loops. For now, we just need to know that the `group` variant must be used for transitions back to the start of a group.
- `\_regex_action_submatch:nN`  $\{ \langle \text{group} \rangle \}$   $\langle \text{key} \rangle$  where the  $\langle \text{key} \rangle$  is `<` or `>` for the beginning or end of group numbered  $\langle \text{group} \rangle$ . This causes the current position in the query to be stored as the  $\langle \text{key} \rangle$  submatch boundary.
- One of these actions, within a conditional.

We strive to preserve the following properties while building.

- The current capturing group is `capturing_group - 1`, and if a group opened now it would be labelled `capturing_group`.
- The last allocated state is `max_state - 1`, so `max_state` is a free state.
- The `left_state` points to a state to the left of the current group or of the last class.
- The `right_state` points to a newly created, empty state, with some transitions leading to it.
- The `left/right` sequences hold a list of the corresponding end-points of nested groups.

<code>\_regex_build:n</code> <code>\_regex_build_aux:Nn</code> <code>\_regex_build:N</code> <code>\_regex_build_aux:NN</code>	<p>The <code>n</code>-type function first compiles its argument. Reset some variables. Allocate two states, and put a wildcard in state 0 (transitions to state 1 and 0 state). Then build the regex within a (capturing) group numbered 0 (current value of <code>capturing_group</code>). Finally, if the match reaches the last state, it is successful. A <code>false</code> boolean for argument <code>#1</code> for the auxiliaries will suppress the wildcard and make the match anchored: used for <code>\peek_regex:nTF</code> and similar.</p>

(End of definition for `\_regex_case_build:n`, `\_regex_case_build_aux:Nn`, and `\_regex_case_build_loop:n`.)

`\_regex_build_for_cs:n` The matching code relies on some global intarray variables, but only uses a range of their entries. Specifically,

- `\g__regex_state_active_intarray` from `\l__regex_min_state_int` to `\l__regex_max_state_int`;

Here, in this nested call to the matching code, we need the new versions of this range to involve completely new entries of the intarray variables, so we begin by setting (the new) `\l__regex_min_state_int` to (the old) `\l__regex_max_state_int` to use higher entries.

When using a regex to match a cs, we don't insert a wildcard, we anchor at the end, and since we ignore submatches, there is no need to surround the expression with a group. However, for branches to work properly at the outer level, we need to put the appropriate `left` and `right` states in their sequence.

```

6238 \cs_new_protected:Npn \_regex_build_for_cs:n #1
6239 {
6240     \int_set_eq:NN \l__regex_min_state_int \l__regex_max_state_int

### 49.4.3 Helpers for building an nfa

\\_regex\_push\_lr\_states: When building the regular expression, we keep track of pointers to the left-end and right-end of each group without help from T<sub>E</sub>X's grouping.

```

6253 \cs_new_protected:Npn \_regex_push_lr_states:
6254 {
6255     \seq_push:Nn \l__regex_left_state_seq
6256     { \int_use:N \l__regex_left_state_int }
6257     \seq_push:Nn \l__regex_right_state_seq
6258     { \int_use:N \l__regex_right_state_int }
6259 }
6260 \cs_new_protected:Npn \_regex_pop_lr_states:
6261 {
6262     \seq_pop:Nn \l__regex_left_state_seq \l__regex_tmpa_tl
6263     \int_set:Nn \l__regex_left_state_int \l__regex_tmpa_tl
6264     \seq_pop:Nn \l__regex_right_state_seq \l__regex_tmpa_tl
6265     \int_set:Nn \l__regex_right_state_int \l__regex_tmpa_tl
6266 }

```

(End of definition for \\_regex\_push\_lr\_states: and \\_regex\_pop\_lr\_states:.)

\\_regex\_build\_transition\_left:NNN  
\\_regex\_build\_transition\_right:nNn

Add a transition from #2 to #3 using the function #1. The `left` function is used for higher priority transitions, and the `right` function for lower priority transitions (which should be performed later). The signatures differ to reflect the differing usage later on. Both functions could be optimized.

```

6267 \cs_new_protected:Npn \_regex_build_transition_left:NNN #1#2#3
6268 { \_regex_toks_put_left:Ne #2 { #1 { \tex_the:D \_regex_int_eval:w #3 - #2 } } }
6269 \cs_new_protected:Npn \_regex_build_transition_right:nNn #1#2#3
6270 { \_regex_toks_put_right:Ne #2 { #1 { \tex_the:D \_regex_int_eval:w #3 - #2 } } }

```

(End of definition for \\_regex\_build\_transition\_left:NNN and \\_regex\_build\_transition\_right:nNn.)

\\_regex\_build\_new\_state:

Add a new empty state to the NFA. Then update the `left`, `right`, and `max` states, so that the `right` state is the new empty state, and the `left` state points to the previously “current” state.

```

6271 \cs_new_protected:Npn \_regex_build_new_state:
6272 {
6273     \_regex_toks_clear:N \l__regex_max_state_int
6274     \int_set_eq:NN \l__regex_left_state_int \l__regex_right_state_int
6275     \int_set_eq:NN \l__regex_right_state_int \l__regex_max_state_int
6276     \int_incr:N \l__regex_max_state_int
6277 }

```

(End of definition for \\_regex\_build\_new\_state:.)

`\__regex_build_transitions_laziness:NNNN`

This function creates a new state, and puts two transitions starting from the old current state. The order of the transitions is controlled by #1, true for lazy quantifiers, and false for greedy quantifiers.

```
6278 \cs_new_protected:Npn \__regex_build_transitions_laziness:NNNN #1#2#3#4#5
6279 {
6280   \__regex_build_new_state:
6281   \__regex_toks_put_right:Ne \l__regex_left_state_int
6282   {
6283     \if_meaning:w \c_true_bool #1
6284       #2 { \tex_the:D \__regex_int_eval:w #3 - \l__regex_left_state_int }
6285       #4 { \tex_the:D \__regex_int_eval:w #5 - \l__regex_left_state_int }
6286     \else:
6287       #4 { \tex_the:D \__regex_int_eval:w #5 - \l__regex_left_state_int }
6288       #2 { \tex_the:D \__regex_int_eval:w #3 - \l__regex_left_state_int }
6289     \fi:
6290   }
6291 }
```

(End of definition for `\__regex_build_transitions_laziness:NNNN`.)

#### 49.4.4 Building classes

`\__regex_class:NnnnN`  
`\__regex_tests_action_cost:n`

The arguments are:  $\langle\text{boolean}\rangle$   $\{\langle\text{tests}\rangle\}$   $\{\langle\text{min}\rangle\}$   $\{\langle\text{more}\rangle\}$   $\langle\text{laziness}\rangle$ . First store the tests with a trailing `\__regex_action_cost:n`, in the true branch of `\__regex_break_point:TF` for positive classes, or the false branch for negative classes. The integer  $\langle\text{more}\rangle$  is 0 for fixed repetitions,  $-1$  for unbounded repetitions, and  $\langle\text{max}\rangle - \langle\text{min}\rangle$  for a range of repetitions.

```
6292 \cs_new_protected:Npn \__regex_class:NnnnN #1#2#3#4#5
6293 {
6294   \cs_set:Npe \__regex_tests_action_cost:n ##1

6305   \fi:
6306 }
6307 \cs_new:Npn \__regex_tests_action_cost:n { \__regex_action_cost:n }
```

(End of definition for `\__regex_class:NnnnN` and `\__regex_tests_action_cost:n`.)

`\__regex_class_repeat:n`

This is used for a fixed number of repetitions. Build one state for each repetition, with a transition controlled by the tests that we have collected. That works just fine for  $\#1 = 0$  repetitions: nothing is built.

```
6308 \cs_new_protected:Npn \__regex_class_repeat:n #1
6309 {
6310   \prg_replicate:nn {#1}
6311   {
```

```

6312     \__regex_build_new_state:
6313     \__regex_build_transition_right:nNn \__regex_tests_action_cost:n
6314     \l__regex_left_state_int \l__regex_right_state_int
6315 }
6316 }

```

(End of definition for \\_\_regex\_class\_repeat:n.)

\\_\_regex\_class\_repeat:nN This implements unbounded repetitions of a single class (*e.g.* the \* and + quantifiers). If the minimum number #1 of repetitions is 0, then build a transition from the current state to itself governed by the tests, and a free transition to a new state (hence skipping the tests). Otherwise, call \\_\_regex\_class\_repeat:n for the code to match #1 repetitions, and add free transitions from the last state to the previous one, and to a new one. In both cases, the order of transitions is controlled by the laziness boolean #2.

```

6317 \cs_new_protected:Npn \__regex_class_repeat:nN #1#2
6318 {
6319   \if_int_compare:w #1 = \c_zero_int
6320     \__regex_build_transitions_laziness:NNNN #2
6321     \__regex_action_free:n \l__regex_right_state_int
6322     \__regex_tests_action_cost:n \l__regex_left_state_int
6323   \else:
6324     \__regex_class_repeat:n {#1}
6325     \int_set_eq:NN \l__regex_tmpa_int \l__regex_left_state_int
6326     \__regex_build_transitions_laziness:NNNN #2
6327     \__regex_action_free:n \l__regex_right_state_int
6328     \__regex_action_free:n \l__regex_tmpa_int
6329   \fi:
6330 }

```

(End of definition for \\_\_regex\_class\_repeat:nN.)

\\_\_regex\_class\_repeat:nnN We want to build the code to match from #1 to #1 + #2 repetitions. Match #1 repetitions (can be 0). Compute the final state of the next construction as a. Build #2 > 0 states, each with a transition to the next state governed by the tests, and a transition to the final state a. The computation of a is safe because states are allocated in order, starting from max\_state.

```

6331 \cs_new_protected:Npn \__regex_class_repeat:nnN #1#2#3
6332 {
6333   \__regex_class_repeat:n {#1}
6334   \int_set:Nn \l__regex_tmpa_int

6336   \prg_replicate:nn { #2 }
6337   {
6338     \__regex_build_transitions_laziness:NNNN #3
6339     \__regex_action_free:n \l__regex_tmpa_int
6340     \__regex_tests_action_cost:n \l__regex_right_state_int
6341   }
6342 }

```

(End of definition for \\_\_regex\_class\_repeat:nnN.)

## 49.4.5 Building groups

`\__regex_group_aux:nnnnN`

Arguments:  $\{\langle label \rangle\}$   $\{\langle contents \rangle\}$   $\{\langle min \rangle\}$   $\{\langle more \rangle\}$   $\langle laziness \rangle$ . If  $\langle min \rangle$  is 0, we need to add a state before building the group, so that the thread which skips the group does not also set the start-point of the submatch. After adding one more state, the `left_state` is the left end of the group, from which all branches stem, and the `right_state` is the right end of the group, and all branches end their course in that state. We store those two integers to be queried for each branch, we build the NFA states for the contents #2 of the group, and we forget about the two integers. Once this is done, perform the repetition: either exactly #3 times, or #3 or more times, or between #3 and #3 + #4 times, with laziness #5. The  $\langle label \rangle$  #1 is used for submatch tracking. Each of the three auxiliaries expects `left_state` and `right_state` to be set properly.

```

6343 \cs_new_protected:Npn \__regex_group_aux:nnnnN #1#2#3#4#5
6344 {
6345     \if_int_compare:w #3 = \c_zero_int
6346         \__regex_build_new_state:
6347         \__regex_build_transition_right:nNn \__regex_action_free_group:n
6348         \l__regex_left_state_int \l__regex_right_state_int
6349     \fi:
6350     \__regex_build_new_state:
6351     \__regex_push_lr_states:
6352     #2
6353     \__regex_pop_lr_states:
6354     \if_case:w - #4 \exp_stop_f:
6355         \__regex_group_repeat:nn {#1} {#3}
6356     \or: \__regex_group_repeat:nnN {#1} {#3} #5
6357     \else: \__regex_group_repeat:nnnN {#1} {#3} {#4} #5
6358     \fi:
6359 }
```

(End of definition for `\__regex_group_aux:nnnnN`.)

`\__regex_group:nnnN`

`\__regex_group_no_capture:nnnN`

Hand to `\__regex_group_aux:nnnnN` the label of that group (expanded), and the group itself, with some extra commands to perform.

```

6360 \cs_new_protected:Npn \__regex_group:nnnN #1
6361 {
6362     \exp_args:No \__regex_group_aux:nnnnN
6363     { \int_use:N \l__regex_capturing_group_int }
6364     {
6365         \int_incr:N \l__regex_capturing_group_int
6366         #1
6367     }
6368 }
6369 \cs_new_protected:Npn \__regex_group_no_capture:nnnN
6370 { \__regex_group_aux:nnnnN { -1 } }
```

(End of definition for `\__regex_group:nnnN` and `\__regex_group_no_capture:nnnN`.)

`\__regex_group_resetting:nnnN`

`\__regex_group_resetting_loop:nnnN`

Again, hand the label  $-1$  to `\__regex_group_aux:nnnnN`, but this time we work a little bit harder to keep track of the maximum group label at the end of any branch, and to reset the group number at each branch. This relies on the fact that a compiled regex always is a sequence of items of the form `\__regex_branch:n`  $\{\langle branch \rangle\}$ .

```

6371 \cs_new_protected:Npn \__regex_group_resetting:nnnN #1
```

```

6372 {
6373   \__regex_group_aux:nnnnN { -1 }
6374   {
6375     \exp_args:Noo \__regex_group_resetting_loop:nnNn
6376     { \int_use:N \l__regex_capturing_group_int }
6377     { \int_use:N \l__regex_capturing_group_int }
6378     #1
6379     { ?? \prg_break:n } { }
6380     \prg_break_point:
6381   }
6382 }
6383 \cs_new_protected:Npn \__regex_group_resetting_loop:nnNn #1#2#3#4
6384 {
6385   \use_none:nn #3 { \int_set:Nn \l__regex_capturing_group_int {#1} }
6386   \int_set:Nn \l__regex_capturing_group_int {#2}
6387   #3 {#4}
6388   \exp_args:Ne \__regex_group_resetting_loop:nnNn
6389   { \int_max:nn {#1} \l__regex_capturing_group_int }
6390   {#2}
6391 }

```

(End of definition for \\_\_regex\_group\_resetting:nnnN and \\_\_regex\_group\_resetting\_loop:nnNn.)

\\_\_regex\_branch:n Add a free transition from the left state of the current group to a brand new state, starting point of this branch. Once the branch is built, add a transition from its last state to the right state of the group. The left and right states of the group are extracted from the relevant sequences.

```

6392 \cs_new_protected:Npn \__regex_branch:n #1
6393 {
6394   \__regex_build_new_state:
6395   \seq_get:NN \l__regex_left_state_seq \l__regex_tmpa_tl
6396   \int_set:Nn \l__regex_left_state_int \l__regex_tmpa_tl
6397   \__regex_build_transition_right:nNn \__regex_action_free:n
6398   \l__regex_left_state_int \l__regex_right_state_int
6399   #1
6400   \seq_get:NN \l__regex_right_state_seq \l__regex_tmpa_tl
6401   \__regex_build_transition_right:nNn \__regex_action_free:n
6402   \l__regex_right_state_int \l__regex_tmpa_tl
6403 }

```

(End of definition for \\_\_regex\_branch:n.)

\\_\_regex\_group\_repeat:nn This function is called to repeat a group a fixed number of times #2; if this is 0 we remove the group altogether (but don't reset the capturing\_group label). Otherwise, the auxiliary \\_\_regex\_group\_repeat\_aux:n copies #2 times the \toks for the group, and leaves internal\_a pointing to the left end of the last repetition. We only record the submatch information at the last repetition. Finally, add a state at the end (the transition to it has been taken care of by the replicating auxiliary).

```

6404 \cs_new_protected:Npn \__regex_group_repeat:nn #1#2
6405 {
6406   \if_int_compare:w #2 = \c_zero_int
6407   \int_set:Nn \l__regex_max_state_int
6408   { \l__regex_left_state_int - \c_one_int }
6409   \__regex_build_new_state:

```

```

6410     \else:
6411         \__regex_group_repeat_aux:n {#2}
6412         \__regex_group_submatches:nNN {#1}
6413         \l__regex_tmpa_int \l__regex_right_state_int
6414         \__regex_build_new_state:
6415     \fi:
6416 }

```

(End of definition for \\_\_regex\_group\_repeat:nn.)

\\_\_regex\_group\_submatches:nNN This inserts in states #2 and #3 the code for tracking submatches of the group #1, unless inhibited by a label of -1.

```

6417 \cs_new_protected:Npn \__regex_group_submatches:nNN #1#2#3
6418 {
6419     \if_int_compare:w #1 > - \c_one_int
6420         \__regex_toks_put_left:Ne #2 { \__regex_action_submatch:n {#1} < }
6421         \__regex_toks_put_left:Ne #3 { \__regex_action_submatch:n {#1} > }
6422     \fi:
6423 }

```

(End of definition for \\_\_regex\_group\_submatches:nNN.)

\\_\_regex\_group\_repeat\_aux:n Here we repeat \toks ranging from left\_state to max\_state, #1 > 0 times. First add a transition so that the copies “chain” properly. Compute the shift c between the original copy and the last copy we want. Shift the right\_state and max\_state to their final values. We then want to perform c copy operations. At the end, b is equal to the max\_state, and a points to the left of the last copy of the group.

```

6424 \cs_new_protected:Npn \__regex_group_repeat_aux:n #1
6425 {
6426     \__regex_build_transition_right:nNn \__regex_action_free:n
6427     \l__regex_right_state_int \l__regex_max_state_int
6428     \int_set_eq:NN \l__regex_tmpa_int \l__regex_left_state_int
6429     \int_set_eq:NN \l__regex_tmpb_int \l__regex_max_state_int
6430     \if_int_compare:w \__regex_int_eval:w #1 > \c_one_int
6431         \int_set:Nn \l__regex_tmpc_int
6432         {
6433             ( #1 - \c_one_int )
6434             * ( \l__regex_tmpb_int - \l__regex_tmpa_int )
6435         }
6436         \int_add:Nn \l__regex_right_state_int \l__regex_tmpc_int

6441         \l__regex_tmpc_int
6442     \fi:
6443 }

```

(End of definition for \\_\_regex\_group\_repeat\_aux:n.)

\\_\_regex\_group\_repeat:nnN This function is called to repeat a group at least n times; the case n = 0 is very different from n > 0. Assume first that n = 0. Insert submatch tracking information at the start and end of the group, add a free transition from the right end to the “true” left state a

(remember: in this case we had added an extra state before the left state). This forms the loop, which we break away from by adding a free transition from `a` to a new state.

Now consider the case  $n > 0$ . Repeat the group  $n$  times, chaining various copies with a free transition. Add submatch tracking only to the last copy, then add a free transition from the right end back to the left end of the last copy, either before or after the transition to move on towards the rest of the NFA. This transition can end up before submatch tracking, but that is irrelevant since it only does so when going again through the group, recording new matches. Finally, add a state; we already have a transition pointing to it from `__regex_group_repeat_aux:n`.

```

6444 \cs_new_protected:Npn \__regex_group_repeat:nnN #1#2#3

(End of definition for `__regex_group_repeat:nnN`.)

`__regex_group_repeat:nnnN`

We wish to repeat the group between `#2` and `#2 + #3` times, with a laziness controlled by `#4`. We insert submatch tracking up front: in principle, we could avoid recording submatches for the first `#2` copies of the group, but that forces us to treat specially the case `#2 = 0`. Repeat that group with submatch tracking `#2 + #3` times (the maximum number of repetitions). Then our goal is to add `#3` transitions from the end of the `#2`-th group, and each subsequent groups, to the end. For a lazy quantifier, we add those transitions to the left states, before submatch tracking. For the greedy case, we add the transitions to the right states, after submatch tracking and the transitions which go on with more repetitions. In the greedy case with `#2 = 0`, the transition which skips over all

copies of the group must be added separately, because its starting state does not follow the normal pattern: we had to add it “by hand” earlier.

```

6475 \cs_new_protected:Npn \__regex_group_repeat:nnnN #1#2#3#4

```

(End of definition for `\__regex_command_K:.`)

## 49.5 Matching

We search for matches by running all the execution threads through the NFA in parallel, reading one token of the query at each step. The NFA contains “free” transitions to other states, and transitions which “consume” the current token. For free transitions, the instruction at the new state of the NFA is performed immediately. When a transition consumes a character, the new state is appended to a list of “active states”, stored in `\g__regex_thread_info_intarray` (together with submatch information): this thread is made active again when the next token is read from the query. At every step (for each token in the query), we unpack that list of active states and the corresponding submatch props, and empty those.

If two paths through the NFA “collide” in the sense that they reach the same state after reading a given token, then they only differ in how they previously matched, and any future execution would be identical for both. (Note that this would be wrong in the presence of back-references.) Hence, we only need to keep one of the two threads: the thread with the highest priority. Our NFA is built in such a way that higher priority actions always come before lower priority actions, which makes things work.

The explanation in the previous paragraph may make us think that we simply need to keep track of which states were visited at a given step: after all, the loop generated when matching `(a?)*` against `a` is broken, isn’t it? No. The group first matches `a`, as it should, then repeats; it attempts to match `a` again but fails; it skips `a`, and finds out that this state has already been seen at this position in the query: the match stops. The capturing group is (wrongly) `a`. What went wrong is that a thread collided with itself, and the later version, which has gone through the group one more times with an empty match, should have a higher priority than not going through the group.

We solve this by distinguishing “normal” free transitions `\__regex_action_free:n` from transitions `\__regex_action_free_group:n` which go back to the start of the group. The former keeps threads unless they have been visited by a “completed” thread, while the latter kind of transition also prevents going back to a state visited by the current thread.

### 49.5.1 Variables used when matching

```

\l__regex_min_pos_int
\l__regex_max_pos_int
\l__regex_curr_pos_int
\l__regex_start_pos_int
\l__regex_success_pos_int

```

The tokens in the query are indexed from `min_pos` for the first to `max_pos` – 1 for the last, and their information is stored in several arrays and `\toks` registers with those numbers. We match without backtracking, keeping all threads in lockstep at the `curr_pos` in the query. The starting point of the current match attempt is `start_pos`, and `success_pos`, updated whenever a thread succeeds, is used as the next starting position.

```

6569 \int_new:N \l__regex_min_pos_int
6570 \int_new:N \l__regex_max_pos_int
6571 \int_new:N \l__regex_curr_pos_int
6572 \int_new:N \l__regex_start_pos_int
6573 \int_new:N \l__regex_success_pos_int

```

(End of definition for `\l__regex_min_pos_int` and others.)

`\l__regex_curr_char_int` The character and category codes of the token at the current position and a token list  
`\l__regex_curr_catcode_int` expanding to that token; the character code of the token at the previous position; the  
`\l__regex_curr_token_tl` character code of the token just before a successful match; and the character code of the  
`\l__regex_last_char_int` result of changing the case of the current token (A-Z↔a-z). This last integer is only  
`\l__regex_last_char_success_int` computed when necessary, and is otherwise `\c_max_int`. The `curr_char` variable is also  
`\l__regex_case_changed_char_int` used in various other phases to hold a character code.

```
6574 \int_new:N \l__regex_curr_char_int
6575 \int_new:N \l__regex_curr_catcode_int
6576 \tl_new:N \l__regex_curr_token_tl
6577 \int_new:N \l__regex_last_char_int
6578 \int_new:N \l__regex_last_char_success_int
6579 \int_new:N \l__regex_case_changed_char_int
```

(End of definition for `\l__regex_curr_char_int` and others.)

`\l__regex_curr_state_int` For every character in the token list, each of the active states is considered in turn.  
The variable `\l__regex_curr_state_int` holds the state of the NFA which is currently  
considered: transitions are then given as shifts relative to the current state.

```
6580 \int_new:N \l__regex_curr_state_int
```

(End of definition for `\l__regex_curr_state_int`.)

`\l__regex_curr_submatches_tl` The submatches for the thread which is currently active are stored in the `curr_-`  
`\l__regex_success_submatches_tl` `submatches` list, which is almost a comma list, but ends with a comma. This list is stored  
by `\__regex_store_state:n` into an intarray variable, to be retrieved when matching at  
the next position. When a thread succeeds, this list is copied to `\l__regex_success_-`  
`submatches_tl`: only the last successful thread remains there.

```
6581 \tl_new:N \l__regex_curr_submatches_tl
6582 \tl_new:N \l__regex_success_submatches_tl
```

(End of definition for `\l__regex_curr_submatches_tl` and `\l__regex_success_submatches_tl`.)

`\l__regex_step_int` This integer, always even, is increased every time a character in the query is read, and not  
reset when doing multiple matches. We store in `\g__regex_state_active_intarray` the  
last step in which each `<state>` in the NFA was encountered. This lets us break infinite  
loops by not visiting the same state twice in the same step. In fact, the step we store  
is equal to `step` when we have started performing the operations of `\toks<state>`, but  
not finished yet. However, once we finish, we store `step + 1` in `\g__regex_state_-`  
`active_intarray`. This is needed to track submatches properly (see building phase).  
The `step` is also used to attach each set of submatch information to a given iteration  
(and automatically discard it when it corresponds to a past step).

```
6583 \int_new:N \l__regex_step_int
```

(End of definition for `\l__regex_step_int`.)

`\l__regex_min_thread_int` All the currently active threads are kept in order of precedence in `\g__regex_thread_-`  
`\l__regex_max_thread_int` `info_intarray` together with the corresponding submatch information. Data in this  
intarray is organized as blocks from `min_thread` (included) to `max_thread` (excluded).  
At the start of every step, the whole array is unpacked, so that the space can immediately  
be reused, and `max_thread` is reset to `min_thread`, effectively clearing the array.

```
6584 \int_new:N \l__regex_min_thread_int
6585 \int_new:N \l__regex_max_thread_int
```

(End of definition for `\l__regex_min_thread_int` and `\l__regex_max_thread_int`.)

`\g__regex_state_active_intarray` `\g__regex_thread_info_intarray` stores the last *<step>* in which each *<state>* was active. `\g__regex_thread_info_intarray` stores threads to be considered in the next step, more precisely the states in which these threads are.

```
6586 \intarray_new:Nn \g__regex_state_active_intarray { 65536 }
6587 \intarray_new:Nn \g__regex_thread_info_intarray { 65536 }
```

(End of definition for `\g__regex_state_active_intarray` and `\g__regex_thread_info_intarray`.)

`\l__regex_matched_analysis_tl` `\l__regex_curr_analysis_tl` The list `\l__regex_curr_analysis_tl` consists of a brace group containing three brace groups corresponding to the current token, with the same syntax as `\tl_analysis_map_inline:nn`. The list `\l__regex_matched_analysis_tl` (constructed under the `tl_build` machinery) has one item for each token that has already been treated so far in a given match attempt: each item consists of three brace groups with the same syntax as `\tl_analysis_map_inline:nn`.

```
6588 \tl_new:N \l__regex_matched_analysis_tl
6589 \tl_new:N \l__regex_curr_analysis_tl
```

(End of definition for `\l__regex_matched_analysis_tl` and `\l__regex_curr_analysis_tl`.)

`\l__regex_every_match_tl` Every time a match is found, this token list is used. For single matching, the token list is empty. For multiple matching, the token list is set to repeat the matching, after performing some operation which depends on the user function. See `\__regex_single_match:` and `\__regex_multi_match:n`.

```
6590 \tl_new:N \l__regex_every_match_tl
```

(End of definition for `\l__regex_every_match_tl`.)

`\l__regex_fresh_thread_bool` `\l__regex_empty_success_bool` `\__regex_if_two_empty_matches:F` When doing multiple matches, we need to avoid infinite loops where each iteration matches the same empty token list. When an empty token list is matched, the next successful match of the same empty token list is suppressed. We detect empty matches by setting `\l__regex_fresh_thread_bool` to `true` for threads which directly come from the start of the regex or from the `\K` command, and testing that boolean whenever a thread succeeds. The function `\__regex_if_two_empty_matches:F` is redefined at every match attempt, depending on whether the previous match was empty or not: if it was, then the function must cancel a purported success if it is empty and at the same spot as the previous match; otherwise, we definitely don't have two identical empty matches, so the function is `\use:n`.

```
6591 \bool_new:N \l__regex_fresh_thread_bool
6592 \bool_new:N \l__regex_empty_success_bool
6593 \cs_new_eq:NN \__regex_if_two_empty_matches:F \use:n
```

(End of definition for `\l__regex_fresh_thread_bool`, `\l__regex_empty_success_bool`, and `\__regex_if_two_empty_matches:F`.)

`\g__regex_success_bool` `\l__regex_saved_success_bool` `\l__regex_match_success_bool` The boolean `\l__regex_match_success_bool` is true if the current match attempt was successful, and `\g__regex_success_bool` is true if there was at least one successful match. This is the only global variable in this whole module, but we would need it to be local when matching a control sequence with `\c{...}`. This is done by saving the global variable into `\l__regex_saved_success_bool`, which is local, hence not affected by the changes due to inner regex functions.

```
6594 \bool_new:N \g__regex_success_bool
6595 \bool_new:N \l__regex_saved_success_bool
6596 \bool_new:N \l__regex_match_success_bool
```

(End of definition for `\g__regex_success_bool`, `\l__regex_saved_success_bool`, and `\l__regex-match_success_bool`.)

## 49.5.2 Matching: framework

```

__regex_match:n Initialize the variables that should be set once for each user function (even for multiple
__regex_match_cs:n matches). Namely, the overall matching is not yet successful; none of the states should
__regex_match_init: be marked as visited (\g__regex_state_active_intarray), and we start at step 0; we
pretend that there was a previous match ending at the start of the query, which was not
empty (to avoid smothering an empty match at the start). Once all this is set up, we are
ready for the ride. Find the first match.

```

(End of definition for `\__regex_match:n`, `\__regex_match_cs:n`, and `\__regex_match_init:.`)

`\__regex_match_once_init:` This function resets various variables used when finding one match. It is called before the loop through characters, and every time we find a match, before searching for another match (this is controlled by the `every_match` token list).

First initialize some variables: set the conditional which detects identical empty matches; this match attempt starts at the previous `success_pos`, is not yet successful, and has no submatches yet; clear the array of active threads, and put the starting state 0 in it. We are then almost ready to read our first token in the query, but we actually start one position earlier than the start because `\__regex_match_one_token:nnN` increments `\l__regex_curr_pos_int` and saves `\l__regex_curr_char_int` as the `last_char` so that word boundaries can be correctly identified.

```

6639 \cs_new_protected:Npn \__regex_match_once_init:

```

(End of definition for \\_\_regex\_single\_match: and \\_\_regex\_multi\_match:n.)

\\_\_regex\_match\_one\_token:nnN \\_\_regex\_match\_one\_active:n

At each new position, set some variables and get the new character and category from the query. Then unpack the array of active threads, and clear it by resetting its length (`max_thread`). This results in a sequence of `\__regex_use_state_and_submatches:w`  $\langle state \rangle, \langle submatch-clist \rangle$  `\__regex_sep:` and we consider those states one by one in order. As soon as a thread succeeds, exit the step, and, if there are threads to consider at the next position, and we have not reached the end of the string, repeat the loop. Otherwise, the last thread that succeeded is the match. We explain the `fresh_thread` business when describing `\__regex_action_wildcard:`.

### 49.5.3 Using states of the nfa

\\_\_regex\_use\_state: Use the current NFA instruction. The state is initially marked as belonging to the current **step**: this allows normal free transition to repeat, but group-repeating transitions won't. Once we are done exploring all the branches it spawned, the state is marked as **step + 1**: any thread hitting it at that point will be terminated.

```

6730 \cs_new_protected:Npn \__regex_use_state:
6731 {
6732     \__kernel_intarray_gset:Nnn \g__regex_state_active_intarray
6733     \l__regex_curr_state_int \l__regex_step_int
6734     \__regex_toks_use:w \l__regex_curr_state_int
6735     \__kernel_intarray_gset:Nnn \g__regex_state_active_intarray
6736     \l__regex_curr_state_int
6737     { \__regex_int_eval:w \l__regex_step_int + \c_one_int \scan_stop: }
6738 }

```

(End of definition for \\_\_regex\_use\_state:.)

\\_\_regex\_use\_state\_and\_submatches:w This function is called as one item in the array of active threads after that array has been unpacked for a new step. Update the `curr_state` and `curr_submatches` and use the state if it has not yet been encountered at this step.

```

6739 \cs_new_protected:Npn \__regex_use_state_and_submatches:w #1 , #2 \__regex_sep:
6740 {
6741     \int_set:Nn \l__regex_curr_state_int {#1}
6742     \if_int_compare:w
6743         \__kernel_intarray_item:Nn \g__regex_state_active_intarray
6744         \l__regex_curr_state_int
6745         < \l__regex_step_int
6746     \tl_set:Nn \l__regex_curr_submatches_tl { #2 , }
6747     \exp_after:wN \__regex_use_state:
6748     \fi:
6749     \scan_stop:
6750 }

```

(End of definition for \\_\_regex\_use\_state\_and\_submatches:w.)

## 49.5.4 Actions when matching

`\__regex_action_start_wildcard:N`

For an unanchored match, state 0 has a free transition to the next and a costly one to itself, to repeat at the next position. To catch repeated identical empty matches, we need to know if a successful thread corresponds to an empty match. The instruction resetting `\l__regex_fresh_thread_bool` may be skipped by a successful thread, hence we had to add it to `\__regex_match_one_token:nnN` too.

```
6751 \cs_new_protected:Npn \__regex_action_start_wildcard:N #1
6752 {
6753   \bool_set_true:N \l__regex_fresh_thread_bool
6754   \__regex_action_free:n {1}
6755   \bool_set_false:N \l__regex_fresh_thread_bool
6756   \bool_if:NT #1 { \__regex_action_cost:n {0} }
6757 }
```

(End of definition for `\__regex_action_start_wildcard:N`.)

`\__regex_action_free:n`

These functions copy a thread after checking that the NFA state has not already been used at this position. If not, store submatches in the new state, and insert the instructions for that state in the input stream. Then restore the old value of `\l__regex_curr_state_int` and of the current submatches. The two types of free transitions differ by how they test that the state has not been encountered yet: the `group` version is stricter, and will not use a state if it was used earlier in the current thread, hence forcefully breaking the loop, while the “normal” version will revisit a state even within the thread itself.

```
6758 \cs_new_protected:Npn \__regex_action_free:n
6759 { \__regex_action_free_aux:nn { > \l__regex_step_int \else: } }
6760 \cs_new_protected:Npn \__regex_action_free_group:n
6761 { \__regex_action_free_aux:nn { < \l__regex_step_int } }
6762 \cs_new_protected:Npn \__regex_action_free_aux:nn #1#2
6763 {
6764   \use:e
6765   {
6766     \int_add:Nn \l__regex_curr_state_int {#2}
6767     \exp_not:n
6768     {
6769       \if_int_compare:w
6770         \__kernel_intarray_item:Nn \g__regex_state_active_intarray
6771         \l__regex_curr_state_int
6772         #1
6773         \exp_after:wN \__regex_use_state:
6774         \fi:
6775     }
6776     \int_set:Nn \l__regex_curr_state_int
6777     { \int_use:N \l__regex_curr_state_int }
6778     \tl_set:Nn \exp_not:N \l__regex_curr_submatches_tl
6779     { \exp_not:o \l__regex_curr_submatches_tl }
6780   }
6781 }
```

(End of definition for `\__regex_action_free:n`, `\__regex_action_free_group:n`, and `\__regex_action_free_aux:nn`.)

`\__regex_action_cost:n`

A transition which consumes the current character and shifts the state by #1. The resulting state is stored in the appropriate array for use at the next position, and we also store the current submatches.

```

6782 \cs_new_protected:Npn \__regex_action_cost:n #1
6783 {
6784   \exp_args:No \__regex_store_state:n
6785   { \tex_the:D \__regex_int_eval:w \l__regex_curr_state_int + #1 }
6786 }

```

(End of definition for \\_\_regex\_action\_cost:n.)

\\_\_regex\_store\_state:n Put the given state and current submatch information in \g\_\_regex\_thread\_info\_intarray, and increment the length of the array.

```

6787 \cs_new_protected:Npn \__regex_store_state:n #1
6788 {
6789   \exp_args:No \__regex_store_submatches:nn
6790   \l__regex_curr_submatches_tl {#1}
6791   \int_incr:N \l__regex_max_thread_int
6792 }
6793 \cs_new_protected:Npn \__regex_store_submatches:nn #1#2
6794 {
6795   \__kernel_intarray_gset_range_from_clist:Nnn
6796   \g__regex_thread_info_intarray
6797   {
6798     \__regex_int_eval:w
6799     \c_one_int + \l__regex_max_thread_int *
6800     (\l__regex_capturing_group_int * 2 + \c_one_int)
6801   }
6802   { #2 , #1 }
6803 }

```

(End of definition for \\_\_regex\_store\_state:n and \\_\_regex\_store\_submatches:.)

\\_\_regex\_disable\_submatches: Some user functions don't require tracking submatches. We get a performance improvement by simply defining the relevant functions to remove their argument and do nothing with it.

```

6804 \cs_new_protected:Npn \__regex_disable_submatches:
6805 {
6806   \cs_set_protected:Npn \__regex_store_submatches:n ##1 { }
6807   \cs_set_protected:Npn \__regex_action_submatch:nN ##1##2 { }
6808 }

```

(End of definition for \\_\_regex\_disable\_submatches:.)

\\_\_regex\_action\_submatch:nN Update the current submatches with the information from the current position. Maybe a bottleneck.

```

\__regex_action_submatch_aux:w
\__regex_action_submatch_auxii:w
\__regex_action_submatch_auxiii:w
\__regex_action_submatch_auxiv:w
6809 \cs_new_protected:Npn \__regex_action_submatch:nN #1#2
6810 {
6811   \exp_after:wN \__regex_action_submatch_aux:w
6812   \l__regex_curr_submatches_tl \__regex_sep: {#1} #2
6813 }
6814 \cs_new_protected:Npn \__regex_action_submatch_aux:w #1 \__regex_sep: #2#3
6815 {
6816   \tl_set:Nx \l__regex_curr_submatches_tl
6817   {
6818     \prg_replicate:nn
6819     { #2 \if_meaning:w > #3 + \l__regex_capturing_group_int \fi: }

```

```

6820         { \__regex_action_submatch_auxii:w }
6821         \__regex_action_submatch_auxiii:w
6822         #1
6823     }
6824 }
6825 \cs_new:Npn \__regex_action_submatch_auxii:w
6826     #1 \__regex_action_submatch_auxiii:w #2 ,
6827     { #2 , #1 \__regex_action_submatch_auxiii:w }
6828 \cs_new:Npn \__regex_action_submatch_auxiii:w #1 ,
6829     { \int_use:N \l__regex_curr_pos_int , }

```

(End of definition for \\_\_regex\_action\_submatch:nN and others.)

\\_\_regex\_action\_success: There is a successful match when an execution path reaches the last state in the NFA, unless this marks a second identical empty match. Then mark that there was a successful match; it is empty if it is “fresh”; and we store the current position and submatches. The current step is then interrupted with \prg\_break:, and only paths with higher precedence are pursued further. The values stored here may be overwritten by a later success of a path with higher precedence.

```

6830 \cs_new_protected:Npn \__regex_action_success:
6831     {
6832         \__regex_if_two_empty_matches:F
6833         {
6834             \bool_set_true:N \l__regex_match_success_bool
6835             \bool_set_eq:NN \l__regex_empty_success_bool
6836             \l__regex_fresh_thread_bool
6837             \int_set_eq:NN \l__regex_success_pos_int \l__regex_curr_pos_int
6838             \int_set_eq:NN \l__regex_last_char_success_int \l__regex_last_char_int
6839             \tl_build_begin:N \l__regex_matched_analysis_tl
6840             \tl_set_eq:NN \l__regex_success_submatches_tl
6841             \l__regex_curr_submatches_tl
6842             \prg_break:
6843         }
6844     }

```

(End of definition for \\_\_regex\_action\_success:.)

## 49.6 Replacement

### 49.6.1 Variables and helpers used in replacement

\l\_\_regex\_replacement\_csnames\_int The behaviour of closing braces inside a replacement text depends on whether a sequences \c{ or \u{ has been encountered. The number of “open” such sequences that should be closed by } is stored in \l\_\_regex\_replacement\_csnames\_int, and decreased by 1 by each }.

```

6845 \int_new:N \l__regex_replacement_csnames_int

```

(End of definition for \l\_\_regex\_replacement\_csnames\_int.)

\l\_\_regex\_replacement\_category\_tl This sequence of letters is used to correctly restore categories in nested constructions such as \cL(abc\cD(\_)d).

\l\_\_regex\_replacement\_category\_seq

```

6846 \tl_new:N \l__regex_replacement_category_tl
6847 \seq_new:N \l__regex_replacement_category_seq

```

(End of definition for `\l__regex_replacement_category_tl` and `\l__regex_replacement_category_seq`.)

`\g__regex_balance_tl` This token list holds the replacement text for `\__regex_replacement_balance_one_match:n` while it is being built incrementally.

```
6848 \tl_new:N \g__regex_balance_tl
```

(End of definition for `\g__regex_balance_tl`.)

`\__regex_replacement_balance_one_match:n` This expects as an argument the first index of a set of entries in `\g__regex_submatch_begin_intarray` (and related arrays) which hold the submatch information for a given match. It can be used within an integer expression to obtain the brace balance incurred by performing the replacement on that match. This combines the braces lost by removing the match, braces added by all the submatches appearing in the replacement, and braces appearing explicitly in the replacement. Even though it is always redefined before use, we initialize it as for an empty replacement. An important property is that concatenating several calls to that function must result in a valid integer expression (hence a leading + in the actual definition).

```
6849 \cs_new:Npn \__regex_replacement_balance_one_match:n #1
6850 { - \__regex_submatch_balance:n {#1} }
```

(End of definition for `\__regex_replacement_balance_one_match:n`.)

`\__regex_replacement_do_one_match:n` The input is the same as `\__regex_replacement_balance_one_match:n`. This function is redefined to expand to the part of the token list from the end of the previous match to a given match, followed by the replacement text. Hence concatenating the result of this function with all possible arguments (one call for each match), as well as the range from the end of the last match to the end of the string, produces the fully replaced token list. The initialization does not matter, but (as an example) we set it as for an empty replacement.

```
6851 \cs_new:Npn \__regex_replacement_do_one_match:n #1
6852 {
6853   \__regex_query_range:nn
6854   { \__kernel_intarray_item:Nn \g__regex_submatch_prev_intarray {#1} }
6855   { \__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray {#1} }
6856 }
```

(End of definition for `\__regex_replacement_do_one_match:n`.)

`\__regex_replacement_exp_not:N` This function lets us navigate around the fact that the primitive `\exp_not:n` requires a braced argument. As far as I can tell, it is only needed if the user tries to include in the replacement text a control sequence set equal to a macro parameter character, such as `\c_parameter_token`. Indeed, within an e/x-expanding assignment, `\exp_not:N #` behaves as a single #, whereas `\exp_not:n {#}` behaves as a doubled ##.

```
6857 \cs_new:Npn \__regex_replacement_exp_not:N #1 { \exp_not:n {#1} }
```

(End of definition for `\__regex_replacement_exp_not:N`.)

`\__regex_replacement_exp_not:V` This is used for the implementation of `\u`, and it gets redefined for `\peek_regex_replace_once:nnTF`.

```
6858 \cs_new_eq:NN \__regex_replacement_exp_not:V \exp_not:V
```

(End of definition for `\__regex_replacement_exp_not:V`.)

## 49.6.2 Query and brace balance

`\__regex_query_range:nn`  
`\__regex_query_range_loop:ww`

When it is time to extract submatches from the token list, the various tokens are stored in `\toks` registers numbered from `\l__regex_min_pos_int` inclusive to `\l__regex_max_pos_int` exclusive. The function `\__regex_query_range:nn {<min>} {<max>}` unpacks registers from the position `<min>` to the position `<max>-1` included. Once this is expanded, a second e-expansion results in the actual tokens from the query. That second expansion is only done by user functions at the very end of their operation, after checking (and correcting) the brace balance first.

```

6859 \cs_new:Npn \__regex_query_range:nn #1#2
6860 {
6861   \exp_after:wN \__regex_query_range_loop:ww
6862   \int_value:w \__regex_int_eval:w #1 \exp_after:wN \__regex_sep:
6863   \int_value:w \__regex_int_eval:w #2 \__regex_sep:
6864   \prg_break_point:
6865 }
6866 \cs_new:Npn \__regex_query_range_loop:ww #1 \__regex_sep: #2 \__regex_sep:
6867 {
6868   \if_int_compare:w #1 < #2 \exp_stop_f:
6869   \else:
6870     \prg_break:n
6871   \fi:
6872   \__regex_toks_use:w #1 \exp_stop_f:
6873   \exp_after:wN \__regex_query_range_loop:ww
6874   \int_value:w \__regex_int_eval:w #1 + \c_one_int \__regex_sep: #2 \__regex_sep:
6875 }
```

(End of definition for `\__regex_query_range:nn` and `\__regex_query_range_loop:ww`.)

`\__regex_query_submatch:n`

Find the start and end positions for a given submatch (of a given match).

```

6876 \cs_new:Npn \__regex_query_submatch:n #1
6877 {
6878   \__regex_query_range:nn
6879   { \__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray {#1} }
6880   { \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray {#1} }
6881 }
```

(End of definition for `\__regex_query_submatch:n`.)

`\__regex_submatch_balance:n`

Every user function must result in a balanced token list (unbalanced token lists cannot be stored by TeX). When we unpacked the query, we kept track of the brace balance, hence the contribution from a given range is the difference between the brace balances at the `<max pos>` and `<min pos>`. These two positions are found in the corresponding “submatch” arrays.

```

6882 \cs_new_protected:Npn \__regex_submatch_balance:n #1
6883 {
6884   \tex_the:D \__regex_int_eval:w
6885   \__regex_intarray_item:NnF \g__regex_balance_intarray
6886   {
6887     \__kernel_intarray_item:Nn
6888     \g__regex_submatch_end_intarray {#1}
6889   }
6890   \c_zero_int
6891   -
```

```

6892     \__regex_intarray_item:NnF \g__regex_balance_intarray
6893     {
6894         \__kernel_intarray_item:Nn
6895         \g__regex_submatch_begin_intarray {#1}
6896     }
6897     \c_zero_int
6898     \scan_stop:
6899 }

```

(End of definition for \\_\_regex\_submatch\_balance:n.)

### 49.6.3 Framework

```

\__regex_replacement:n
\__regex_replacement:e
  \__regex_replacement_apply:Nn
\__regex_replacement_set:n

```

The replacement text is built incrementally. We keep track in \l\_\_regex\_balance\_int of the balance of explicit begin- and end-group tokens and we store in \g\_\_regex\_balance\_tl some code to compute the brace balance from submatches (see its description). Detect unescaped right braces, and escaped characters, with trailing \prg\_do\_nothing: because some of the later function look-ahead. Once the whole replacement text has been parsed, make sure that there is no open csname. Finally, define the balance\_one\_match and do\_one\_match functions.

```

6900 \cs_new_protected:Npn \__regex_replacement:n
6901   { \__regex_replacement_apply:Nn \__regex_replacement_set:n }

\\_\_regex\_replacement\_put:n This gets redefined for \peek\_regex\_replace\_once:nnTF.

```

6992 \cs_new_protected:Npn \__regex_replacement_put:n
6993 { \tl_build_put_right:Nn \l__regex_build_tl }

```

(End of definition for \\_\_regex\_replacement\_put:n.)

\\_\_regex\_replacement\_normal:n  
 \\_\_regex\_replacement\_normal\_aux:N

Most characters are simply sent to the output by \tl\_build\_put\_right:Nn, unless a particular category code has been requested: then \\_\_regex\_replacement\_c\_A:w or a similar auxiliary is called. One exception is right parentheses, which restore the category code in place before the group started. Note that the sequence is non-empty there: it contains an empty entry corresponding to the initial value of \l\_\_regex\_replacement\_category\_tl. The argument #1 is a single character (including the case of a catcode-other space). In case no specific catcode is requested, we take into account the current catcode régime (at the time the replacement is performed) as much as reasonable, with all impossible catcodes (escape, newline, etc.) being mapped to “other”.

```

7046     \else:
7047         \__regex_replacement_normal:n {#1}
7048     \fi:
7049     }
7050 }

```

(End of definition for `\__regex_replacement_escaped:N`.)

#### 49.6.4 Submatches

`\__regex_replacement_put_submatch:n`  
`\__regex_replacement_put_submatch_aux:n`

Insert a submatch in the replacement text. This is dropped if the submatch number is larger than the number of capturing groups. Unless the submatch appears inside a `\c{...}` or `\u{...}` construction, it must be taken into account in the brace balance. Later on, `##1` will be replaced by a pointer to the 0-th submatch for a given match.

```

7051 \cs_new_protected:Npn \__regex_replacement_put_submatch:n #1
7052 {
7053     \if_int_compare:w #1 < \l__regex_capturing_group_int
7054     \__regex_replacement_put_submatch_aux:n {#1}
7055 \else:
7056     \msg_expandable_error:nnff { regex } { submatch-too-big }
7057     {#1} { \int_eval:n { \l__regex_capturing_group_int - \c_one_int } }
7058 \fi:

```

```

7059 }

7098   \fi:
7099 }
7100 #1 #2
7101 }

```

(End of definition for \\_\_regex\_replacement\_g:w and \\_\_regex\_replacement\_g\_digits:NN.)

## 49.6.5 Csnames in replacement

`\__regex_replacement_c:w` `\c` may only be followed by an unescaped character. If followed by a left brace, start a control sequence by calling an auxiliary common with `\u`. Otherwise test whether the category is known; if it is not, complain.

```

7102 \cs_new_protected:Npn \__regex_replacement_c:w #1#2
7103 {
7104   \token_if_eq_meaning:NNTF #1 \__regex_replacement_normal:n
7105   {
7106     \cs_if_exist:cTF { \__regex_replacement_c_#2:w }
7107     { \__regex_replacement_cat:NNN #2 }
7108     { \__regex_replacement_error:NNN c #1#2 }
7109   }
7110   {
7111     \token_if_eq_meaning:NNTF #1 \__regex_replacement_lbrace:N
7112     { \__regex_replacement_cu_aux:Nw \__regex_replacement_exp_not:N }
7113     { \__regex_replacement_error:NNN c #1#2 }
7114   }
7115 }
```

*(End of definition for \\_\_regex\_replacement\_c:w.)*

`\__regex_replacement_cu_aux:Nw` Start a control sequence with `\cs:w`, protected from expansion by #1 (either `\__regex_replacement_exp_not:N` or `\exp_not:V`), or turned to a string by `\tl_to_str:V` if inside another csname construction `\c` or `\u`. We use `\tl_to_str:V` rather than `\tl_to_str:N` to deal with integers and other registers.

```

7116 \cs_new_protected:Npn \__regex_replacement_cu_aux:Nw #1
7117 {
7118   \if_case:w \l__regex_replacement_csnames_int
7119   \tl_build_put_right:Nn \l__regex_build_tl
7120   { \exp_not:n { \exp_after:wN #1 \cs:w } }
7121   \else:
7122   \tl_build_put_right:Nn \l__regex_build_tl
7123   { \exp_not:n { \exp_after:wN \tl_to_str:V \cs:w } }
7124   \fi:
7125   \int_incr:N \l__regex_replacement_csnames_int
7126 }
```

*(End of definition for \\_\_regex\_replacement\_cu\_aux:Nw.)*

`\__regex_replacement_u:w` Check that `\u` is followed by a left brace. If so, start a control sequence with `\cs:w`, which is then unpacked either with `\exp_not:V` or `\tl_to_str:V` depending on the current context.

```

7127 \cs_new_protected:Npn \__regex_replacement_u:w #1#2
7128 {
7129   \token_if_eq_meaning:NNTF #1 \__regex_replacement_lbrace:N
7130   { \__regex_replacement_cu_aux:Nw \__regex_replacement_exp_not:V }
7131   { \__regex_replacement_error:NNN u #1#2 }
7132 }
```

*(End of definition for \\_\_regex\_replacement\_u:w.)*

`\__regex_replacement_rbrace:N` Within a `\c{...}` or `\u{...}` construction, end the control sequence, and decrease the brace count. Otherwise, this is a raw right brace.

```

7133 \cs_new_protected:Npn \__regex_replacement_rbrace:N #1
7134 {
7135   \if_int_compare:w \l__regex_replacement_csnames_int > \c_zero_int
7136     \tl_build_put_right:Nn \l__regex_build_tl { \cs_end: }
7137     \int_decr:N \l__regex_replacement_csnames_int
7138   \else:
7139     \__regex_replacement_normal:n {#1}
7140   \fi:
7141 }

```

*(End of definition for \\_\_regex\_replacement\_rbrace:N.)*

`\__regex_replacement_lbrace:N` Within a `\c{...}` or `\u{...}` construction, this is forbidden. Otherwise, this is a raw left brace.

```

7142 \cs_new_protected:Npn \__regex_replacement_lbrace:N #1
7143 {
7144   \if_int_compare:w \l__regex_replacement_csnames_int > \c_zero_int
7145     \msg_error:nnn { regex } { cu-lbrace } { u }
7146   \else:
7147     \__regex_replacement_normal:n {#1}
7148   \fi:
7149 }

```

*(End of definition for \\_\_regex\_replacement\_lbrace:N.)*

## 49.6.6 Characters in replacement

`\__regex_replacement_cat:NNN` Here, `#1` is a letter among BEMTPUDSLOA and `#2#3` denote the next character. Complain if we reach the end of the replacement or if the construction appears inside `\c{...}` or `\u{...}`, and detect the case of a parenthesis. In that case, store the current category in a sequence and switch to a new one.

```

7150 \cs_new_protected:Npn \__regex_replacement_cat:NNN #1#2#3
7151 {
7152   \token_if_eq_meaning:NNTF \prg_do_nothing: #3
7153   { \msg_error:nn { regex } { replacement-catcode-end } }
7154   {
7155     \int_compare:nNnTF \l__regex_replacement_csnames_int > \c_zero_int
7156     {
7157       \msg_error:nnnn
7158       { regex } { replacement-catcode-in-cs } {#1} {#3}
7159       #2 #3
7160     }
7161     {
7162       \__regex_two_if_eq:NNNNTF #2 #3 \__regex_replacement_normal:n (
7163       {
7164         \seq_push:NV \l__regex_replacement_category_seq
7165         \l__regex_replacement_category_tl
7166         \tl_set:Nn \l__regex_replacement_category_tl {#1}
7167       }
7168       {
7169         \token_if_eq_meaning:NNT #2 \__regex_replacement_escaped:N

```

```

7170         {
7171             \__regex_char_if_alphanumeric:NTF #3
7172             {
7173                 \msg_error:nnnn
7174                 { regex } { replacement-catcode-escaped }
7175                 {#1} {#3}
7176             }
7177             { }
7178         }
7179         \use:c { __regex_replacement_c_#1:w } #2 #3
7180     }
7181 }
7182 }
7183 }

```

(End of definition for `\__regex_replacement_cat:NNN`.)

We now need to change the category code of the null character many times, hence work in a group. The catcode-specific macros below are defined in alphabetical order; if you are trying to understand the code, start from the end of the alphabet as those categories are simpler than active or begin-group.

```

7184 \group_begin:

```

```

\__regex_replacement_char:nnN

```

The only way to produce an arbitrary character-catcode pair is to use the `\lowercase` or `\uppercase` primitives. This is a wrapper for our purposes. The first argument is the null character with various catcodes. The second and third arguments are grabbed from the input stream: `#3` is the character whose character code to reproduce. We could use `\char_generate:nn` but only for some catcodes (active characters and spaces are not supported).

```

7185 \cs_new_protected:Npn \__regex_replacement_char:nnN #1#2#3
7186 {
7187     \tex_lccode:D \c_zero_int = '#3 \scan_stop:
7188     \tex_lowercase:D { \__regex_replacement_put:n {#1} }
7189 }

```

(End of definition for `\__regex_replacement_char:nnN`.)

```

\__regex_replacement_c_A:w

```

For an active character, expansion must be avoided, twice because we later do two `e`-expansions, to unpack `\toks` for the query, and to expand their contents to tokens of the query.

```

7190 \char_set_catcode_active:N \^^@
7191 \cs_new_protected:Npn \__regex_replacement_c_A:w
7192 { \__regex_replacement_char:nnN { \exp_not:n { \exp_not:N \^^@ } } }

```

(End of definition for `\__regex_replacement_c_A:w`.)

```

\__regex_replacement_c_B:w

```

An explicit begin-group token increases the balance, unless within a `\c{...}` or `\u{...}` construction. Add the desired begin-group character, using the standard `\if_false:` trick. We eventually `e`-expand twice. The first time must yield a balanced token list, and the second one gives the bare begin-group token. The `\exp_after:wN` is not strictly needed, but is more consistent with `l3tl-analysis`.

```

7193 \char_set_catcode_group_begin:N \^^@
7194 \cs_new_protected:Npn \__regex_replacement_c_B:w
7195 {

```

```

7196     \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int
7197     \int_incr:N \l__regex_balance_int
7198     \fi:
7199     \__regex_replacement_char:nNN
7200     { \exp_not:n { \exp_after:wN ^^@ \if_false: } \fi: } }
7201 }

```

(End of definition for `\__regex_replacement_c_B:w`.)

`\__regex_replacement_c_C:w` This is not quite catcode-related: when the user requests a character with category “control sequence”, the one-character control symbol is returned. As for the active character, we prepare for two e-expansions.

```

7202     \cs_new_protected:Npn \__regex_replacement_c_C:w #1#2
7203     {
7204         \tl_build_put_right:Nn \l__regex_build_tl
7205         { \exp_not:N \__regex_replacement_exp_not:N \exp_not:c {#2} }
7206     }

```

(End of definition for `\__regex_replacement_c_C:w`.)

`\__regex_replacement_c_D:w` Subscripts fit the mould: \lowercase the null byte with the correct category.

```

7207     \char_set_catcode_math_subscript:N ^^@
7208     \cs_new_protected:Npn \__regex_replacement_c_D:w
7209     { \__regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\__regex_replacement_c_D:w`.)

`\__regex_replacement_c_E:w` Similar to the begin-group case, the second e-expansion produces the bare end-group token.

```

7210     \char_set_catcode_group_end:N ^^@
7211     \cs_new_protected:Npn \__regex_replacement_c_E:w
7212     {
7213         \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int
7214         \int_decr:N \l__regex_balance_int
7215         \fi:
7216         \__regex_replacement_char:nNN
7217         { \exp_not:n { \if_false: { \fi: ^^@ } } }
7218     }

```

(End of definition for `\__regex_replacement_c_E:w`.)

`\__regex_replacement_c_L:w` Simply \lowercase a letter null byte to produce an arbitrary letter.

```

7219     \char_set_catcode_letter:N ^^@
7220     \cs_new_protected:Npn \__regex_replacement_c_L:w
7221     { \__regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\__regex_replacement_c_L:w`.)

`\__regex_replacement_c_M:w` No surprise here, we lowercase the null math toggle.

```

7222     \char_set_catcode_math_toggle:N ^^@
7223     \cs_new_protected:Npn \__regex_replacement_c_M:w
7224     { \__regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\__regex_replacement_c_M:w`.)

`\__regex_replacement_c_0:w` Lowercase an other null byte.

```

7225 \char_set_catcode_other:N \^^@
7226 \cs_new_protected:Npn \__regex_replacement_c_0:w
7227 { \__regex_replacement_char:nNN { ^^@ } }

```

*(End of definition for \\_\_regex\_replacement\_c\_0:w.)*

`\__regex_replacement_c_P:w` For macro parameters, expansion is a tricky issue. We need to prepare for two `e`-expansions and passing through various macro definitions. Note that we cannot replace one `\exp_not:n` by doubling the macro parameter characters because this would misbehave if a mischievous user asks for `\c{\cP\#}`, since that macro parameter character would be doubled.

```

7228 \char_set_catcode_parameter:N \^^@
7229 \cs_new_protected:Npn \__regex_replacement_c_P:w
7230 {
7231   \__regex_replacement_char:nNN
7232   { \exp_not:n { \exp_not:n { ^^@^^@^^@^^@ } } }
7233 }

```

*(End of definition for \\_\_regex\_replacement\_c\_P:w.)*

`\__regex_replacement_c_S:w` Spaces are normalized on input by T<sub>E</sub>X to have character code 32. It is in fact impossible to get a token with character code 0 and category code 10. Hence we use 32 instead of 0 as our base character.

```

7234 \cs_new_protected:Npn \__regex_replacement_c_S:w #1#2
7235 {
7236   \if_int_compare:w '#2 = \c_zero_int
7237   \msg_error:nn { regex } { replacement-null-space }
7238   \fi:
7239   \tex_lccode:D '\ = '#2 \scan_stop:
7240   \tex_lowercase:D { \__regex_replacement_put:n {~} }
7241 }

```

*(End of definition for \\_\_regex\_replacement\_c\_S:w.)*

`\__regex_replacement_c_T:w` No surprise for alignment tabs here. Those are surrounded by the appropriate braces whenever necessary, hence they don't cause trouble in alignment settings.

```

7242 \char_set_catcode_alignment:N \^^@
7243 \cs_new_protected:Npn \__regex_replacement_c_T:w
7244 { \__regex_replacement_char:nNN { ^^@ } }

```

*(End of definition for \\_\_regex\_replacement\_c\_T:w.)*

`\__regex_replacement_c_U:w` Simple call to `\__regex_replacement_char:nNN` which lowercases the math superscript `^^@`.

```

7245 \char_set_catcode_math_superscript:N \^^@
7246 \cs_new_protected:Npn \__regex_replacement_c_U:w
7247 { \__regex_replacement_char:nNN { ^^@ } }

```

*(End of definition for \\_\_regex\_replacement\_c\_U:w.)*

Restore the catcode of the null byte.

```

7248 \group_end:

```

### 49.6.7 An error

`\_regex_replacement_error:NNN` Simple error reporting by calling one of the messages `replacement-c`, `replacement-g`, or `replacement-u`.

```
7249 \cs_new_protected:Npn \_regex_replacement_error:NNN #1#2#3
7250 {
7251     \msg_error:nne { regex } { replacement-#1 } {#3}
7252     #2 #3
7253 }
```

*(End of definition for \\_regex\_replacement\_error:NNN.)*

## 49.7 User functions

`\regex_new:N` Before being assigned a sensible value, a regex variable matches nothing.

```
7254 \cs_new_protected:Npn \regex_new:N #1
7255 { \cs_new_eq:NN #1 \c__regex_no_match_regex }
```

*(End of definition for \regex\_new:N. This function is documented on page 56.)*

`\l_tmpa_regex` The usual scratch space.

```
\l_tmpb_regex
\g_tmpa_regex
\g_tmpb_regex
7256 \regex_new:N \l_tmpa_regex
7257 \regex_new:N \l_tmpb_regex
7258 \regex_new:N \g_tmpa_regex
7259 \regex_new:N \g_tmpb_regex
```

*(End of definition for \l\_tmpa\_regex and others. These variables are documented on page 61.)*

`\regex_set:Nn` Compile, then store the result in the user variable with the appropriate assignment function.  
`\regex_gset:Nn`  
`\regex_const:Nn`

```
7260 \cs_new_protected:Npn \regex_set:Nn #1#2
7261 {
7262     \__regex_compile:n {#2}
7263     \tl_set_eq:NN #1 \l__regex_tmp_regex
7264 }
7265 \cs_new_protected:Npn \regex_gset:Nn #1#2
7266 {
7267     \__regex_compile:n {#2}
7268     \tl_gset_eq:NN #1 \l__regex_tmp_regex
7269 }
7270 \cs_new_protected:Npn \regex_const:Nn #1#2
7271 {
7272     \__regex_compile:n {#2}
7273     \tl_const:Ne #1 { \exp_not:o \l__regex_tmp_regex }
7274 }
```

*(End of definition for \regex\_set:Nn, \regex\_gset:Nn, and \regex\_const:Nn. These functions are documented on page 56.)*

`\regex_show:n` User functions: the `n` variant requires compilation first. Then show the variable with some appropriate text. The auxiliary `\__regex_show:N` is defined in a different section.  
`\regex_log:n`

```
\__regex_show:Nn
\regex_show:N
\regex_log:N
7275 \cs_new_protected:Npn \regex_show:n { \__regex_show:Nn \msg_show:nneeee }
7276 \cs_new_protected:Npn \regex_log:n { \__regex_show:Nn \msg_log:nneeee }
7277 \cs_new_protected:Npn \__regex_show:Nn #1#2
\__regex_show:NN
```

```

7278 {
7279     \__regex_compile:n {#2}
7280     \__regex_show:N \l__regex_tmp_regex
7281     #1 { regex } { show }
7282     { \tl_to_str:n {#2} } { }
7283     { \l__regex_tmpa_tl } { }
7284 }
7285 \cs_new_protected:Npn \regex_show:N { \__regex_show:NN \msg_show:nneeee }
7286 \cs_new_protected:Npn \regex_log:N { \__regex_show:NN \msg_log:nneeee }
7287 \cs_new_protected:Npn \__regex_show:NN #1#2
7288 {
7289     \__kernel_chk_tl_type:NnnT #2 { regex }
7290     { \exp_args:No \__regex_clean_regex:n {#2} }
7291     {
7292         \__regex_show:N #2
7293         #1 { regex } { show }
7294         { } { \token_to_str:N #2 }
7295         { \l__regex_tmpa_tl } { }
7296     }
7297 }

```

(End of definition for `\regex_show:n` and others. These functions are documented on page 56.)

`\regex_if_match:nnTF` Those conditionals are based on a common auxiliary defined later. Its first argument builds the NFA corresponding to the regex, and the second argument is the query token list. Once we have performed the match, convert the resulting boolean to `\prg_return_true:` or false.

```

7298 \prg_new_protected_conditional:Npnn \regex_if_match:nn #1#2 { T , F , TF }
7299 {
7300     \__regex_if_match:nn { \__regex_build:n {#1} } {#2}
7301     \__regex_return:
7302 }
7303 \prg_generate_conditional_variant:Nnn \regex_if_match:nn { nV } { T , F , TF }
7304 \prg_new_protected_conditional:Npnn \regex_if_match:Nn #1#2 { T , F , TF }
7305 {
7306     \__regex_if_match:nn { \__regex_build:N #1 } {#2}
7307     \__regex_return:
7308 }
7309 \prg_generate_conditional_variant:Nnn \regex_if_match:Nn { NV } { T , F , TF }

```

(End of definition for `\regex_if_match:nnTF` and `\regex_if_match:NnTF`. These functions are documented on page 57.)

`\regex_count:nnN` Again, use an auxiliary whose first argument builds the NFA.  
`\regex_count:nVN`  
`\regex_count:NnN`  
`\regex_count:NVN`

```

7310 \cs_new_protected:Npn \regex_count:nnN #1
7311 { \__regex_count:nnN { \__regex_build:n {#1} } }
7312 \cs_new_protected:Npn \regex_count:NnN #1
7313 { \__regex_count:nnN { \__regex_build:N #1 } }
7314 \cs_generate_variant:Nn \regex_count:nnN { nV }
7315 \cs_generate_variant:Nn \regex_count:NnN { NV }

```

(End of definition for `\regex_count:nnN` and `\regex_count:NnN`. These functions are documented on page 57.)

`\regex_match_case:nn`  
`\regex_match_case:nnTF`

The auxiliary errors if #1 has an odd number of items, and otherwise it sets `\g__regex_case_int` according to which case was found (zero if not found). The `true` branch leaves the corresponding code in the input stream.

```

7316 \cs_new_protected:Npn \regex_match_case:nnTF #1#2#3
7317 {
7318   \__regex_match_case:nnTF {#1} {#2}
7319   {
7320     \tl_item:nn {#1} { 2 * \g__regex_case_int }
7321     #3
7322   }
7323 }
7324 \cs_new_protected:Npn \regex_match_case:nn #1#2
7325 { \regex_match_case:nnTF {#1} {#2} { } { } }
7326 \cs_new_protected:Npn \regex_match_case:nnT #1#2#3
7327 { \regex_match_case:nnTF {#1} {#2} {#3} { } }
7328 \cs_new_protected:Npn \regex_match_case:nnF #1#2
7329 { \regex_match_case:nnTF {#1} {#2} { } }

```

(End of definition for `\regex_match_case:nnTF`. This function is documented on page 57.)

`\regex_extract_once:nnN`  
`\regex_extract_once:nVN`  
`\regex_extract_once:nnNTF`  
`\regex_extract_once:nVNTF`  
`\regex_extract_once:NnN`  
`\regex_extract_once:NVN`  
`\regex_extract_once:NnNTF`  
`\regex_extract_once:NVNTF`  
`\regex_extract_all:nnN`  
`\regex_extract_all:nVN`  
`\regex_extract_all:nnNTF`  
`\regex_extract_all:nVNTF`  
`\regex_extract_all:NnN`  
`\regex_extract_all:NVN`  
`\regex_extract_all:NnNTF`  
`\regex_extract_all:NVNTF`  
`\regex_replace_once:nnN`  
`\regex_replace_once:nVN`  
`\regex_replace_once:nnNTF`  
`\regex_replace_once:nVNTF`  
`\regex_replace_once:NnN`  
`\regex_replace_once:NVN`  
`\regex_replace_once:NnNTF`  
`\regex_replace_once:NVNTF`  
`\regex_replace_all:nnN`  
`\regex_replace_all:nVN`  
`\regex_replace_all:nnNTF`  
`\regex_replace_all:nVNTF`

We define here 40 user functions, following a common pattern in terms of `:nnN` auxiliaries, defined in the coming subsections. The auxiliary is handed `\__regex_build:n` or `\__regex_build:N` with the appropriate regex argument, then all other necessary arguments (replacement text, token list, etc. The conditionals call `\__regex_return:` to return either true or false once matching has been performed.

```

7330 \cs_set_protected:Npn \__regex_tmp:w #1#2#3
7331 {
7332   \cs_new_protected:Npn #2 ##1 { #1 { \__regex_build:n {##1} } }
7333   \cs_new_protected:Npn #3 ##1 { #1 { \__regex_build:N {##1} } }
7334   \prg_new_protected_conditional:Npnn #2 ##1##2##3 { T , F , TF }
7335   { #1 { \__regex_build:n {##1} } {##2} ##3 \__regex_return: }
7336   \prg_new_protected_conditional:Npnn #3 ##1##2##3 { T , F , TF }
7337   { #1 { \__regex_build:N {##1} } {##2} ##3 \__regex_return: }
7338   \cs_generate_variant:Nn #2 { nV }
7339   \prg_generate_conditional_variant:Nnn #2 { nV } { T , F , TF }
7340   \cs_generate_variant:Nn #3 { NV }
7341   \prg_generate_conditional_variant:Nnn #3 { NV } { T , F , TF }
7342 }
7343 \__regex_tmp:w \__regex_extract_once:nnN
7344 \regex_extract_once:nnN \regex_extract_once:NnN
7345 \__regex_tmp:w \__regex_extract_all:nnN
7346 \regex_extract_all:nnN \regex_extract_all:NnN
7347 \__regex_tmp:w \__regex_replace_once:nnN
7348 \regex_replace_once:nnN \regex_replace_once:NnN
7349 \__regex_tmp:w \__regex_replace_all:nnN
7350 \regex_replace_all:nnN \regex_replace_all:NnN
7351 \__regex_tmp:w \__regex_split:nnN \regex_split:nnN \regex_split:NnN

```

(End of definition for `\regex_extract_once:nnNTF` and others. These functions are documented on page 58.)

`\regex_replace_all:NnN`  
`\regex_replace_case_once:nnN`  
`\regex_replace_all:NVN`  
`\regex_replace_case_once:nnNTF`  
`\regex_replace_all:NnNTF`  
`\regex_replace_all:NVNTF`  
`\regex_split:NnN`  
`\regex_split:NVN`  
`\regex_split:NnNTF`  
`\regex_split:NVNTF`  
`\regex_split:nnN`  
`\regex_split:nVN`  
`\regex_split:nnNTF`  
`\regex_split:nVNTF`

If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as `\regex_replace_once:nnN`, but with more complicated code to

build the automaton, and to find what replacement text to use. The `\tl_item:nn` is only expanded once we know the value of `\g__regex_case_int`, namely which case matched.

```

7352 \cs_new_protected:Npn \regex_replace_case_once:nNTF #1#2
7353 {
7354   \int_if_odd:nTF { \tl_count:n {#1} }
7355   {
7356     \msg_error:nneeee { regex } { case-odd }
7357     { \token_to_str:N \regex_replace_case_once:nN(TF) } { code }
7358     { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7359     \use_ii:nn
7360   }
7361   {
7362     \__regex_replace_once_aux:nnN
7363     { \__regex_case_build:e { \__regex_tl_odd_items:n {#1} } }
7364     { \__regex_replacement:e { \tl_item:nn {#1} { 2 * \g__regex_case_int } } }
7365     #2
7366     \bool_if:NTF \g__regex_success_bool
7367   }
7368 }
7369 \cs_new_protected:Npn \regex_replace_case_once:nN #1#2
7370 { \regex_replace_case_once:nNTF {#1} {#2} { } { } }
7371 \cs_new_protected:Npn \regex_replace_case_once:nNT #1#2#3
7372 { \regex_replace_case_once:nNTF {#1} {#2} {#3} { } }
7373 \cs_new_protected:Npn \regex_replace_case_once:nNF #1#2
7374 { \regex_replace_case_once:nNTF {#1} {#2} { } }

```

(End of definition for `\regex_replace_case_once:nNTF`. This function is documented on page 60.)

`\regex_replace_case_all:nN`  
`\regex_replace_case_all:nNTF`

If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as `\regex_replace_all:nnN`, but with more complicated code to build the automaton, and to find what replacement text to use.

```

7375 \cs_new_protected:Npn \regex_replace_case_all:nNTF #1#2
7376 {
7377   \int_if_odd:nTF { \tl_count:n {#1} }
7378   {
7379     \msg_error:nneeee { regex } { case-odd }
7380     { \token_to_str:N \regex_replace_case_all:nN(TF) } { code }
7381     { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7382     \use_iii:nn
7383   }
7384   {
7385     \__regex_replace_all_aux:nnN
7386     { \__regex_case_build:e { \__regex_tl_odd_items:n {#1} } }
7387     { \__regex_case_replacement:e { \__regex_tl_even_items:n {#1} } }
7388     #2
7389     \bool_if:NTF \g__regex_success_bool
7390   }
7391 }
7392 \cs_new_protected:Npn \regex_replace_case_all:nN #1#2
7393 { \regex_replace_case_all:nNTF {#1} {#2} { } { } }
7394 \cs_new_protected:Npn \regex_replace_case_all:nNT #1#2#3
7395 { \regex_replace_case_all:nNTF {#1} {#2} {#3} { } }
7396 \cs_new_protected:Npn \regex_replace_case_all:nNF #1#2
7397 { \regex_replace_case_all:nNTF {#1} {#2} { } }

```

(End of definition for `\regex_replace_case_all:nNTF`. This function is documented on page 60.)

## 49.7.1 Variables and helpers for user functions

`\l__regex_match_count_int` The number of matches found so far is stored in `\l__regex_match_count_int`. This is only used in the `\regex_count:nnN` functions.

```
7398 \int_new:N \l__regex_match_count_int
```

(End of definition for `\l__regex_match_count_int`.)

`\l__regex_begin_flag` `\l__regex_end_flag` Those flags are raised to indicate begin-group or end-group tokens that had to be added when extracting submatches.

```
7399 \flag_new:N \l__regex_begin_flag
```

```
7400 \flag_new:N \l__regex_end_flag
```

(End of definition for `\l__regex_begin_flag` and `\l__regex_end_flag`.)

`\l__regex_min_submatch_int` `\l__regex_submatch_int` `\l__regex_zeroth_submatch_int` The end-points of each submatch are stored in two arrays whose index `<submatch>` ranges from `\l__regex_min_submatch_int` (inclusive) to `\l__regex_submatch_int` (exclusive). Each successful match comes with a 0-th submatch (the full match), and one match for each capturing group: submatches corresponding to the last successful match are labelled starting at `zeroth_submatch`. The entry `\l__regex_zeroth_submatch_int` in `\g__regex_submatch_prev_intarray` holds the position at which that match attempt started: this is used for splitting and replacements.

```
7401 \int_new:N \l__regex_min_submatch_int
```

```
7402 \int_new:N \l__regex_submatch_int
```

```
7403 \int_new:N \l__regex_zeroth_submatch_int
```

(End of definition for `\l__regex_min_submatch_int`, `\l__regex_submatch_int`, and `\l__regex_zeroth_submatch_int`.)

`\g__regex_submatch_prev_intarray` `\g__regex_submatch_begin_intarray` `\g__regex_submatch_end_intarray` `\g__regex_submatch_case_intarray` Hold the place where the match attempt begun, the end-points of each submatch, and which regex case the match corresponds to, respectively.

```
7404 \intarray_new:Nn \g__regex_submatch_prev_intarray { 65536 }
```

```
7405 \intarray_new:Nn \g__regex_submatch_begin_intarray { 65536 }
```

```
7406 \intarray_new:Nn \g__regex_submatch_end_intarray { 65536 }
```

```
7407 \intarray_new:Nn \g__regex_submatch_case_intarray { 65536 }
```

(End of definition for `\g__regex_submatch_prev_intarray` and others.)

`\g__regex_balance_intarray` The first thing we do when matching is to store the balance of begin-group/end-group characters into `\g__regex_balance_intarray`.

```
7408 \intarray_new:Nn \g__regex_balance_intarray { 65536 }
```

(End of definition for `\g__regex_balance_intarray`.)

`\l__regex_added_begin_int` `\l__regex_added_end_int` Keep track of the number of left/right braces to add when performing a regex operation such as a replacement.

```
7409 \int_new:N \l__regex_added_begin_int
```

```
7410 \int_new:N \l__regex_added_end_int
```

(End of definition for `\l__regex_added_begin_int` and `\l__regex_added_end_int`.)

`\__regex_return:` This function triggers either `\prg_return_false:` or `\prg_return_true:` as appropriate to whether a match was found or not. It is used by all user conditionals.

```

7411 \cs_new_protected:Npn \__regex_return:
7412 {
7413   \if_meaning:w \c_true_bool \g__regex_success_bool
7414   \prg_return_true:
7415   \else:
7416     \prg_return_false:
7417   \fi:
7418 }
```

*(End of definition for \\_\_regex\_return:.)*

`\__regex_query_set:n` To easily extract subsets of the input once we found the positions at which to cut, store the input tokens one by one into successive `\toks` registers. Also store the brace balance (used to check for overall brace balance) in an array.

```

7419 \cs_new_protected:Npn \__regex_query_set:n #1
7420 {
7421   \int_zero:N \l__regex_balance_int
7422   \int_zero:N \l__regex_curr_pos_int
7423   \__regex_query_set_aux:nN { } F
7424   \tl_analysis_map_inline:nn {#1}
7425   { \__regex_query_set_aux:nN {##1} ##3 }
7426   \__regex_query_set_aux:nN { } F
7427   \int_set_eq:NN \l__regex_max_pos_int \l__regex_curr_pos_int
7428 }
7429 \cs_new_protected:Npn \__regex_query_set_aux:nN #1#2
7430 {
7431   \int_incr:N \l__regex_curr_pos_int
7432   \__regex_toks_set:Nn \l__regex_curr_pos_int {#1}
7433   \__kernel_intarray_gset:Nnn \g__regex_balance_intarray
7434     \l__regex_curr_pos_int \l__regex_balance_int
7435   \if_case:w "#2 \exp_stop_f:
7436   \or: \int_incr:N \l__regex_balance_int
7437   \or: \int_decr:N \l__regex_balance_int
7438   \fi:
7439 }
```

*(End of definition for \\_\_regex\_query\_set:n and \\_\_regex\_query\_set\_aux:nN.)*

## 49.7.2 Matching

`\__regex_if_match:nn` We don't track submatches, and stop after a single match. Build the NFA with #1, and perform the match on the query #2.

```

7440 \cs_new_protected:Npn \__regex_if_match:nn #1#2
7441 {
7442   \group_begin:
7443     \__regex_disable_submatches:
7444     \__regex_single_match:
7445     #1
7446     \__regex_match:n {#2}
7447   \group_end:
7448 }
```

(End of definition for `\__regex_if_match:nn`.)

`\__regex_match_case:nnTF` The code would get badly messed up if the number of items in #1 were not even, so  
`\__regex_match_case_aux:nn` we catch this case, then follow the same code as `\regex_if_match:nnTF` but using  
`\__regex_case_build:n` and without returning a result.

```

7449 \cs_new_protected:Npn \__regex_match_case:nnTF #1#2
7450 {
7451   \int_if_odd:nTF { \tl_count:n {#1} }
7452   {
7453     \msg_error:nneeee { regex } { case-odd }
7454     { \token_to_str:N \regex_match_case:nn(TF) } { code }
7455     { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7456     \use_ii:nn
7457   }
7458   {
7459     \__regex_if_match:nn
7460     { \__regex_case_build:e { \__regex_tl_odd_items:n {#1} } }
7461     {#2}
7462     \bool_if:NTF \g__regex_success_bool
7463   }
7464 }
7465 \cs_new:Npn \__regex_match_case_aux:nn #1#2 { \exp_not:n { {#1} } }

```

(End of definition for `\__regex_match_case:nnTF` and `\__regex_match_case_aux:nn`.)

`\__regex_count:nnN` Again, we don't care about submatches. Instead of aborting after the first “longest match” is found, we search for multiple matches, incrementing `\l__regex_match_count_int` every time to record the number of matches. Build the NFA and match. At the end, store the result in the user's variable.

```

7466 \cs_new_protected:Npn \__regex_count:nnN #1#2#3
7467 {
7468   \group_begin:
7469   \__regex_disable_submatches:
7470   \int_zero:N \l__regex_match_count_int
7471   \__regex_multi_match:n { \int_incr:N \l__regex_match_count_int }
7472   #1
7473   \__regex_match:n {#2}
7474   \exp_args:NNNo
7475   \group_end:
7476   \int_set:Nn #3 { \int_use:N \l__regex_match_count_int }
7477 }

```

(End of definition for `\__regex_count:nnN`.)

### 49.7.3 Extracting submatches

`\__regex_extract_once:nnN` Match once or multiple times. After each match (or after the only match), extract the  
`\__regex_extract_all:nnN` submatches using `\__regex_extract:.` At the end, store the sequence containing all the  
submatches into the user variable #3 after closing the group.

```

7478 \cs_new_protected:Npn \__regex_extract_once:nnN #1#2#3
7479 {
7480   \group_begin:
7481   \__regex_single_match:

```

```

7482     #1
7483     \__regex_match:n {#2}
7484     \__regex_extract:
7485     \__regex_query_set:n {#2}
7486     \__regex_group_end_extract_seq:N #3
7487 }
7488 \cs_new_protected:Npn \__regex_extract_all:nnN #1#2#3
7489 {
7490     \group_begin:
7491     \__regex_multi_match:n { \__regex_extract: }
7492     #1
7493     \__regex_match:n {#2}
7494     \__regex_query_set:n {#2}
7495     \__regex_group_end_extract_seq:N #3
7496 }

```

(End of definition for \\_\_regex\_extract\_once:nnN and \\_\_regex\_extract\_all:nnN.)

\\_\_regex\_split:nnN Splitting at submatches is a bit more tricky. For each match, extract all submatches, and replace the zeroth submatch by the part of the query between the start of the match attempt and the start of the zeroth submatch. This is inhibited if the delimiter matched an empty token list at the start of this match attempt. After the last match, store the last part of the token list, which ranges from the start of the match attempt to the end of the query. This step is inhibited if the last match was empty and at the very end: decrement \l\_\_regex\_submatch\_int, which controls which matches will be used.

```

7497 \cs_new_protected:Npn \__regex_split:nnN #1#2#3
7498 {
7499     \group_begin:
7500     \__regex_multi_match:n

```

(End of definition for \\_\_regex\_split:nnN.)

\\_\_regex\_group\_end\_extract\_seq:N  
 \\_\_regex\_extract\_seq:N  
 \\_\_regex\_extract\_seq:NNn  
 \\_\_regex\_extract\_seq\_loop:Nw

The end-points of submatches are stored as entries of two arrays from \l\_\_regex\_min\_submatch\_int to \l\_\_regex\_submatch\_int (exclusive). Extract the relevant ranges into \g\_\_regex\_tmp\_tl, separated by \\_\_regex\_tmp:w {}. We keep track in the two flags \\_\_regex\_begin and \\_\_regex\_end of the number of begin-group or end-group tokens added to make each of these items overall balanced. At this step, {} is counted as being balanced (same number of begin-group and end-group tokens). This problem is caught by \\_\_regex\_extract\_check:w, explained later. After complaining about any begin-group or end-group tokens we had to add, we are ready to construct the user's sequence outside the group.

7602 }
7603 \fi:
7604 }

```

(End of definition for \\_\_regex\_extract\_seq\_aux:n and \\_\_regex\_extract\_seq\_aux:ww.)

\\_\_regex\_extract\_check:w In \\_\_regex\_group\_end\_extract\_seq:N we had to expand \g\_\_regex\_tmp\_tl to turn \if\_false: constructions into actual begin-group and end-group tokens. This is done with a \\_\_kernel\_tl\_gset:Nx assignment, and \\_\_regex\_extract\_check:w is run immediately after this assignment ends, thanks to the \afterassignment primitive. If all of the items were properly balanced (enough begin-group tokens before end-group tokens, so }{ is not) then \\_\_regex\_extract\_check:w is called just before the closing brace of the \\_\_kernel\_tl\_gset:Nx (thanks to our sneaky \if\_false: { \fi: } construction),

and finds that there is nothing left to expand. If any of the items is unbalanced, the assignment gets ended early by an extra end-group token, and our check finds more tokens needing to be expanded in a new `\__kernel_tl_gset:Nx` assignment. We need to add a begin-group and an end-group tokens to the unbalanced item, namely to the last item found so far, which we reach through a loop.

```

7605 \cs_new_protected:Npn \__regex_extract_check:w
7606 {
7607   \exp_after:wN \__regex_extract_check:n
7608   \exp_after:wN { \if_false: } \fi:
7609 }
7610 \cs_new_protected:Npn \__regex_extract_check:n #1
7611 {
7612   \tl_if_empty:nF {#1}
7613   {
7614     \int_incr:N \l__regex_added_begin_int
7615     \int_incr:N \l__regex_added_end_int
7616     \tex_afterassignment:D \__regex_extract_check:w
7617     \__kernel_tl_gset:Nx \g__regex_tmp_tl
7618     {
7619       \exp_after:wN \__regex_extract_check_loop:w
7620       \g__regex_tmp_tl
7621       \__regex_tmp:w \__regex_extract_check_end:w
7622       #1
7623     }
7624   }
7625 }
7626 \cs_new:Npn \__regex_extract_check_loop:w #1 \__regex_tmp:w #2
7627 {
7628   #2
7629   \exp_not:o {#1}
7630   \__regex_tmp:w { }
7631   \__regex_extract_check_loop:w \prg_do_nothing:
7632 }

```

Arguments of `\__regex_extract_check_end:w` are: #1 is the part of the item before the extra end-group token; #2 is junk; #3 is `\prg_do_nothing:` followed by the not-yet-expanded part of the item after the extra end-group token. In the replacement text, the first brace and the `\if_false: { \fi: }` construction are the added begin-group and end-group tokens (the latter being not-yet expanded, just like #3), while the closing brace after `\exp_not:o {#1}` replaces the extra end-group token that had ended the assignment early. In particular this means that the character code of that end-group token is lost.

```

7633 \cs_new:Npn \__regex_extract_check_end:w
7634   \exp_not:o #1#2 \__regex_extract_check_loop:w #3 \__regex_tmp:w
7635 {
7636   { \exp_not:o {#1} }
7637   #3
7638   \if_false: { \fi: }
7639   \__regex_tmp:w
7640 }

```

*(End of definition for `\__regex_extract_check:w` and others.)*

`\__regex_extract:` Our task here is to store the list of end-points of submatches, and store them in appropriate array entries, from `\l__regex_zeroth_submatch_int` upwards. First, we store in `\__regex_extract_aux:w`

\g\_\_regex\_submatch\_prev\_intarray the position at which the match attempt started. We extract the rest from the comma list \l\_\_regex\_success\_submatches\_tl, which starts with entries to be stored in \g\_\_regex\_submatch\_begin\_intarray and continues with entries for \g\_\_regex\_submatch\_end\_intarray.

```

7680 }

```

(End of definition for \\_\_regex\_extract: and \\_\_regex\_extract\_aux:w.)

## 49.7.4 Replacement

\\_\_regex\_replace\_once:nnN Build the NFA and the replacement functions, then find a single match. If the match failed, simply exit the group. Otherwise, we do the replacement. Extract submatches. Compute the brace balance corresponding to replacing this match by the replacement (this depends on submatches). Prepare the replaced token list: the replacement function produces the

tokens from the start of the query to the start of the match and the replacement text for this match; we need to add the tokens from the end of the match to the end of the query. Finally, store the result in the user's variable after closing the group: this step involves an additional e-expansion, and checks that braces are balanced in the final result.

```

7681 \cs_new_protected:Npn \__regex_replace_once:nnN #1#2
7682 { \__regex_replace_once_aux:nnN {#1} { \__regex_replacement:n {#2} } }
7683 \cs_new_protected:Npn \__regex_replace_once_aux:nnN #1#2#3
7684 {
7685   \group_begin:
7686   \__regex_single_match:
7687   #1
7688   \exp_args:No \__regex_match:n {#3}
7689   \bool_if:NTF \g__regex_success_bool
7690   {
7691     \__regex_extract:
7692     \exp_args:No \__regex_query_set:n {#3}
7693     #2
7694     \int_set:Nn \l__regex_balance_int
7695     { \__regex_replacement_balance_one_match:n \l__regex_zeroth_submatch_int }
7696     \__kernel_tl_set:Nx \l__regex_tmpa_tl
7697     {
7698       \__regex_replacement_do_one_match:n \l__regex_zeroth_submatch_int
7699       \__regex_query_range:nn
7700       {
7701         \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray
7702         \l__regex_zeroth_submatch_int
7703       }
7704       \l__regex_max_pos_int
7705     }
7706     \__regex_group_end_replace:N #3
7707   }
7708   { \group_end: }
7709 }

```

(End of definition for `\__regex_replace_once:nnN` and `\__regex_replace_once_aux:nnN`.)

`\__regex_replace_all:nnN` Match multiple times, and for every match, extract submatches and additionally store the position at which the match attempt started. The entries from `\l__regex_min_submatch_int` to `\l__regex_submatch_int` hold information about submatches of every match in order; each match corresponds to `\l__regex_capturing_group_int` consecutive entries. Compute the brace balance corresponding to doing all the replacements: this is the sum of brace balances for replacing each match. Join together the replacement texts for each match (including the part of the query before the match), and the end of the query.

```

7710 \cs_new_protected:Npn \__regex_replace_all:nnN #1#2
7711 { \__regex_replace_all_aux:nnN {#1} { \__regex_replacement:n {#2} } }

7725         \l__regex_capturing_group_int
7726         { \l__regex_submatch_int - \c_one_int }
7727         \__regex_replacement_balance_one_match:n
7728     }
7729     \__kernel_tl_set:Nx \l__regex_tmpa_tl
7730     {
7731         \int_step_function:nnnN
7732         \l__regex_min_submatch_int
7733         \l__regex_capturing_group_int
7734         { \l__regex_submatch_int - \c_one_int }
7735         \__regex_replacement_do_one_match:n
7736         \__regex_query_range:nn
7737         \l__regex_start_pos_int \l__regex_max_pos_int
7738     }
7739     \__regex_group_end_replace:N #3
7740 }

```

(End of definition for \\_\_regex\_replace\_all:nnN.)

\\_\_regex\_group\_end\_replace:N At this stage \l\_\_regex\_tmpa\_tl (e-expands to the desired result). Guess from \l\_\_-  
 \\_\_regex\_group\_end\_replace\_try: regex\_balance\_int the number of braces to add before or after the result then try  
 \\_\_regex\_group\_end\_replace\_check:w expanding. The simplest case is when \l\_\_regex\_tmpa\_tl together with the braces we  
 \\_\_regex\_group\_end\_replace\_check:n insert via \prg\_replicate:nn give a balanced result, and the assignment ends at the  
 \if\_false: { \fi: } construction: then \\_\_regex\_group\_end\_replace\_check:w sees that there is no material left and we successfully found the result. The harder case  
 is that expanding \l\_\_regex\_tmpa\_tl may produce extra closing braces and end the assignment early. Then we grab the remaining code using; importantly, what follows has  
 not yet been expanded so that \\_\_regex\_group\_end\_replace\_check:n grabs everything until the last brace in \\_\_regex\_group\_end\_replace\_try:, letting us try again with an  
 extra surrounding pair of braces.

```

## 49.7.5 Peeking ahead

\l\_\_regex\_peek\_true\_tl True/false code arguments of \peek\_regex:nTF or similar.

```

7783 \tl_new:N \l__regex_peek_true_tl
7784 \tl_new:N \l__regex_peek_false_tl

```

(End of definition for \l\_\_regex\_peek\_true\_tl and \l\_\_regex\_peek\_false\_tl.)

\l\_\_regex\_replacement\_tl When peeking in \peek\_regex\_replace\_once:nnTF we need to store the replacement text.

```

7785 \tl_new:N \l__regex_replacement_tl

```

(End of definition for \l\_\_regex\_replacement\_tl.)

\l\_\_regex\_input\_tl Stores each token found as \\_\_regex\_input\_item:n {<tokens>}, where the <tokens> o-expand to the token found, as for \tl\_analysis\_map\_inline:nn.

```

7786 \tl_new:N \l__regex_input_tl
7787 \cs_new_eq:NN \__regex_input_item:n ?

```

(End of definition for \l\_\_regex\_input\_tl and \\_\_regex\_input\_item:n.)

**\peek\_regex:nTF**

**\peek\_regex:NTF**

**\peek\_regex\_remove\_once:nTF**

**\peek\_regex\_remove\_once:NTF**

The T and F functions just call the corresponding TF function. The four TF functions differ along two axes: whether to remove the token or not, distinguished by using \\_\_regex\_peek\_end: or \\_\_regex\_peek\_remove\_end:n (the latter case needs an argument, as we will see), and whether the regex has to be compiled or is already in an N-type variable, distinguished by calling \\_\_regex\_build\_aux:Nn or \\_\_regex\_build\_aux:NN. The first

argument of these functions is `\c_false_bool` to indicate that there should be no implicit insertion of a wildcard at the start of the pattern: otherwise the code would keep looking further into the input stream until matching the regex.

```

```

(End of definition for `\peek_regex:nTF` and others. These functions are documented on page 215.)

`\__regex_peek:nnTF`  
`\__regex_peek_aux:nnTF`

Store the user's true/false codes (plus `\group_end:`) into two token lists. Then build the automaton with `#1`, without submatch tracking, and aiming for a single match. Then start matching by setting up a few variables like for any regex matching like `\regex_if_match:nnTF`, with the addition of `\l__regex_input_tl` that keeps track of the tokens seen, to reinsert them at the end. Instead of `\tl_analysis_map_inline:nn` on the input, we call `\peek_analysis_map_inline:n` to go through tokens in the input stream. Since `\__regex_match_one_token:nnN` calls `\__regex_maplike_break:` we need to catch that and break the `\peek_analysis_map_inline:n` loop instead.

```

7853 }

```

(End of definition for \\_\_regex\_peek:nnTF and \\_\_regex\_peek\_aux:nnTF.)

\\_\_regex\_peek\_end: Once the regex matches (or permanently fails to match) we call \\_\_regex\_peek\_end:, or  
 \\_\_regex\_peek\_remove\_end:n \\_\_regex\_peek\_remove\_end:n with argument the last token seen. For \peek\_regex:nTF  
 we reinsert tokens seen by calling \\_\_regex\_peek\_reinsert:N regardless of the result  
 of the match. For \peek\_regex\_remove\_once:nTF we reinsert the tokens seen only if  
 the match failed; otherwise we just reinsert the tokens #1, with one expansion. To be  
 more precise, #1 consists of tokens that o-expand and e-expand to the last token seen,  
 for example it is \exp\_not:N <cs> for a control sequence. This means that just doing  
 \exp\_after:wN \l\_\_regex\_peek\_true\_tl #1 would be unsafe because the expansion of  
 <cs> would be suppressed.

```

7854 \cs_new_protected:Npn \__regex_peek_end:
7855 {
7856   \bool_if:NTF \g__regex_success_bool
7857   { \__regex_peek_reinsert:N \l__regex_peek_true_tl }
7858   { \__regex_peek_reinsert:N \l__regex_peek_false_tl }
7859 }
7860 \cs_new_protected:Npn \__regex_peek_remove_end:n #1
7861 {
7862   \bool_if:NTF \g__regex_success_bool
7863   { \exp_args:NNo \use:nn \l__regex_peek_true_tl {#1} }
7864   { \__regex_peek_reinsert:N \l__regex_peek_false_tl }
7865 }

```

(End of definition for \\_\_regex\_peek\_end: and \\_\_regex\_peek\_remove\_end:n.)

`\__regex_peek_reinsert:N` Insert the true/false code #1, followed by the tokens found, which were stored in `\l__regex_input_tl`. For this, loop through that token list using `\__regex_reinsert_item:n`, which expands #1 once to get a single token, and jumps over it to expand what follows, with suitable `\exp:w` and `\exp_end:`. We cannot just use `\use:e` on the whole token list because the result may be unbalanced, which would stop the primitive prematurely, or let it continue beyond where we would like.

```

7866 \cs_new_protected:Npn \__regex_peek_reinsert:N #1
7867 {
7868     \tl_build_end:N \l__regex_input_tl
7869     \cs_set_eq:NN \__regex_input_item:n \__regex_reinsert_item:n
7870     \exp_after:wN #1 \exp:w \l__regex_input_tl \exp_end:
7871 }
7872 \cs_new_protected:Npn \__regex_reinsert_item:n #1
7873 {
7874     \exp_after:wN \exp_after:wN
7875     \exp_after:wN \exp_end:
7876     \exp_after:wN \exp_after:wN
7877     #1
7878     \exp:w
7879 }

```

(End of definition for `\__regex_peek_reinsert:N` and `\__regex_reinsert_item:n`.)

`\peek_regex_replace_once:nn` Similar to `\peek_regex:nTF` above.

`\peek_regex_replace_once:nnTF`

`\peek_regex_replace_once:Nn`

`\peek_regex_replace_once:NnTF`

```

7880 \cs_new_protected:Npn \peek_regex_replace_once:nnTF #1
7881 { \__regex_peek_replace:nnTF { \__regex_build_aux:Nn \c_false_bool {#1} } }
7882 \cs_new_protected:Npn \peek_regex_replace_once:nnT #1#2#3
7883 { \peek_regex_replace_once:nnTF {#1} {#2} {#3} { } }
7884 \cs_new_protected:Npn \peek_regex_replace_once:nnF #1#2
7885 { \peek_regex_replace_once:nnTF {#1} {#2} { } }
7886 \cs_new_protected:Npn \peek_regex_replace_once:nn #1#2
7887 { \peek_regex_replace_once:nnTF {#1} {#2} { } { } }
7888 \cs_new_protected:Npn \peek_regex_replace_once:NnTF #1
7889 { \__regex_peek_replace:nnTF { \__regex_build_aux:NN \c_false_bool #1 } }
7890 \cs_new_protected:Npn \peek_regex_replace_once:NnT #1#2#3
7891 { \peek_regex_replace_once:NnTF #1 {#2} {#3} { } }
7892 \cs_new_protected:Npn \peek_regex_replace_once:NnF #1#2
7893 { \peek_regex_replace_once:NnTF #1 {#2} { } }
7894 \cs_new_protected:Npn \peek_regex_replace_once:Nn #1#2
7895 { \peek_regex_replace_once:NnTF #1 {#2} { } { } }

```

(End of definition for `\peek_regex_replace_once:nnTF` and `\peek_regex_replace_once:NnTF`. These functions are documented on page 216.)

`\__regex_peek_replace:nnTF` Same as `\__regex_peek:nnTF` (used for `\peek_regex:nTF` above), but without disabling submatches, and with a different end. The replacement text #2 is stored, to be analyzed later.

```

7896 \cs_new_protected:Npn \__regex_peek_replace:nnTF #1#2
7897 {
7898     \tl_set:Nn \l__regex_replacement_tl {#2}
7899     \__regex_peek_aux:nnTF {#1} { \__regex_peek_replace_end: }
7900 }

```

(End of definition for `\__regex_peek_replace:nnTF`.)

`\__regex_peek_replace_end:` If the match failed `\__regex_peek_reinsert:N` reinserts the tokens found. Otherwise, finish storing the submatch information using `\__regex_extract:`, and store the input into `\toks`. Redefine a few auxiliaries to change slightly their expansion behaviour as explained below. Analyse the replacement text with `\__regex_replacement:n`, which as usual defines `\__regex_replacement_do_one_match:n` to insert the tokens from the start of the match attempt to the beginning of the match, followed by the replacement text. The `\use:e` expands for instance the trailing `\__regex_query_range:nn` down to a sequence of `\__regex_reinsert_item:n {⟨tokens⟩}` where `⟨tokens⟩` o-expand to a single token that we want to insert. After e-expansion, `\use:e` does `\use:n`, so we have `\exp_after:wN \l__regex_peek_true_tl \exp:w ... \exp_end:.` This is set up such as to obtain `\l__regex_peek_true_tl` followed by the replaced tokens (possibly unbalanced) in the input stream.

```

7901 \cs_new_protected:Npn \__regex_peek_replace_end:
7902 {
7903   \bool_if:NTF \g__regex_success_bool
7904   {
7905     \__regex_extract:
7906     \__regex_query_set_from_input_tl:
7907     \cs_set_eq:NN \__regex_replacement_put:n \__regex_peek_replacement_put:n

7920         \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray
7921         \l__regex_zeroth_submatch_int
7922       }
7923       \l__regex_max_pos_int
7924       \exp_end:
7925     }
7926   }
7927   { \__regex_peek_reinsert:N \l__regex_peek_false_tl }
7928 }

```

(End of definition for `\__regex_peek_replace_end:`)

`\__regex_query_set_from_input_tl:` The input was stored into `\l__regex_input_tl` as successive items `\__regex_input_item:n {⟨tokens⟩}`. Store that in successive `\toks`. It's not clear whether the empty entries before and after are both useful.

```

7929 \cs_new_protected:Npn \__regex_query_set_from_input_tl:
7930 {
7931   \tl_build_end:N \l__regex_input_tl
7932   \int_zero:N \l__regex_curr_pos_int
7933   \cs_set_eq:NN \__regex_input_item:n \__regex_query_set_item:n
7934   \__regex_query_set_item:n { }
7935   \l__regex_input_tl

```

```

7936     \__regex_query_set_item:n { }
7937     \int_set_eq:NN \l__regex_max_pos_int \l__regex_curr_pos_int
7938   }
7939   \cs_new_protected:Npn \__regex_query_set_item:n #1
7940   {
7941     \int_incr:N \l__regex_curr_pos_int
7942     \__regex_toks_set:Nn \l__regex_curr_pos_int { \__regex_input_item:n {#1} }
7943   }

```

(End of definition for \\_\_regex\_query\_set\_from\_input\_tl: and \\_\_regex\_query\_set\_item:n.)

\\_\_regex\_peek\_replacement\_put:n

While building the replacement function \\_\_regex\_replacement\_do\_one\_match:n, we often want to put simple material, given as #1, whose e-expansion o-expands to a single token. Normally we can just add the token to \l\_\_regex\_build\_tl, but for \peek\_regex\_replace\_once:nnTF we eventually want to do some strange expansion that is basically using \exp\_after:wN to jump through numerous tokens (we cannot use e-expansion like for \regex\_replace\_once:nnTF because it is ok for the result to be unbalanced since we insert it in the input stream rather than storing it. When within a csname we don't do any such shenanigan because \cs:w ... \cs\_end: does all the expansion we need.

```

7944   \cs_new_protected:Npn \__regex_peek_replacement_put:n #1
7945   {
7946     \if_case:w \l__regex_replacement_csnames_int
7947       \tl_build_put_right:Nn \l__regex_build_tl
7948       { \exp_not:N \__regex_reinsert_item:n {#1} }
7949     \else:
7950       \tl_build_put_right:Nn \l__regex_build_tl {#1}
7951     \fi:
7952   }

```

(End of definition for \\_\_regex\_peek\_replacement\_put:n.)

\\_\_regex\_peek\_replacement\_token:n

When hit with \exp:w, \\_\_regex\_peek\_replacement\_token:n {<token>} stops \exp\_end: and does \exp\_after:wN <token> \exp:w to continue expansion after it.

```

7953   \cs_new_protected:Npn \__regex_peek_replacement_token:n #1
7954   { \exp_after:wN \exp_end: \exp_after:wN #1 \exp:w }

```

(End of definition for \\_\_regex\_peek\_replacement\_token:n.)

\\_\_regex\_peek\_replacement\_put\_submatch\_aux:n

While analyzing the replacement we also have to insert submatches found in the query. Since query items \\_\_regex\_input\_item:n {<tokens>} expand correctly only when surrounded by \exp:w ... \exp\_end:, and since these expansion controls are not there within csnames (because \cs:w ... \cs\_end: make them unnecessary in most cases), we have to put \exp:w and \exp\_end: by hand here.

```

7955   \cs_new_protected:Npn \__regex_peek_replacement_put_submatch_aux:n #1
7956   {
7957     \if_case:w \l__regex_replacement_csnames_int
7958       \tl_build_put_right:Nn \l__regex_build_tl
7959       { \__regex_query_submatch:n { \__regex_int_eval:w #1 + ##1 \scan_stop: } }
7960     \else:
7961       \tl_build_put_right:Nn \l__regex_build_tl
7962       {
7963         \exp:w
7964         \__regex_query_submatch:n { \__regex_int_eval:w #1 + ##1 \scan_stop: }

```

```

7965         \exp_end:
7966     }
7967     \fi:
7968 }

```

(End of definition for `\_regex_peek_replacement_put_submatch_aux:n`.)

`\_regex_peek_replacement_var:N` This is used for `\u` outside csnames. It makes sure to continue expansion with `\exp:w` before expanding the variable #1 and stopping the `\exp:w` that precedes.

```

7969 \cs_new_protected:Npn \_regex_peek_replacement_var:N #1
7970 {
7971     \exp_after:wN \exp_last_unbraced:NV
7972     \exp_after:wN \exp_end:
7973     \exp_after:wN #1
7974     \exp:w
7975 }

```

(End of definition for `\_regex_peek_replacement_var:N`.)

`__regex_msg_repeated:nnN` This is not technically a message, but seems related enough to go there. The arguments are: **#1** is the minimum number of repetitions; **#2** is the number of allowed extra repetitions ( $-1$  for infinite number), and **#3** tells us about laziness.

```

8266 \cs_new:Npn \__regex_msg_repeated:nnN #1#2#3
8267 {
8268   \str_if_eq:eeF { #1 #2 } { 1 0 }
8269   {
8270     , ~ repeated ~
8271     \int_case:nnF {#2}
8272     {
8273       { -1 } { #1~or-more-times,~\bool_if:NTF #3 { lazy } { greedy } }
8274       { 0 } { #1~times }
8275     }
8276     {
8277       between~#1~and~\int_eval:n {#1+#2}~times,~
8278       \bool_if:NTF #3 { lazy } { greedy }
8279     }
8280   }
8281 }

```

(End of definition for `__regex_msg_repeated:nnN`.)

## 49.9 Code for tracing

There is a more extensive implementation of tracing in the `l3trial` package `l3trace`. Function names are a bit different but could be merged.

`__regex_trace_push:nnN` Here **#1** is the module name (`regex`) and **#2** is typically 1. If the module's current tracing level is less than **#2** show nothing, otherwise write **#3** to the terminal.

```

__regex_trace_pop:nnN
__regex_trace:nne
8282 \cs_new_protected:Npn \__regex_trace_push:nnN #1#2#3
8283 { \__regex_trace:nne {#1} {#2} { entering~ \token_to_str:N #3 } }
8284 \cs_new_protected:Npn \__regex_trace_pop:nnN #1#2#3
8285 { \__regex_trace:nne {#1} {#2} { leaving~ \token_to_str:N #3 } }
8286 \cs_new_protected:Npn \__regex_trace:nne #1#2#3
8287 {
8288   \int_compare:nNnF
8289   { \int_use:c { g__regex_trace_#1_int } } < {#2}
8290   { \iow_term:e { Trace:~#3 } }
8291 }

```

(End of definition for `__regex_trace_push:nnN`, `__regex_trace_pop:nnN`, and `__regex_trace:nne`.)

`g__regex_trace_regex_int` No tracing when that is zero.

```

8292 \int_new:N \g__regex_trace_regex_int

```

*(End of definition for \g\_\_regex\_trace\_regex\_int.)*

\\_\_regex\_trace\_states:n This function lists the contents of all states of the NFA, stored in \toks from 0 to \l\_\_-  
regex\_max\_state\_int (excluded).

```
8293 \cs_new_protected:Npn \__regex_trace_states:n #1
8294 {
8295   \int_step_inline:nnn
8296     \l__regex_min_state_int
8297     { \l__regex_max_state_int - \c_one_int }
8298     {
8299       \__regex_trace:nne { regex } {#1}
8300       { \iow_char:N \toks ##1 = { \__regex_toks_use:w ##1 } }
8301     }
8302 }
```

*(End of definition for \\_\_regex\_trace\_states:n.)*

```
8303 </code>
```

# Chapter 50

## l3prg implementation

The following test files are used for this code: `m3prg001.lvt`, `m3prg002.lvt`, `m3prg003.lvt`.

```
8304 <{*code>
```

### 50.1 Primitive conditionals

`\if_bool:N` Those two primitive TeX conditionals are synonyms. `\if_bool:N` is defined in `l3basics`, as it's needed earlier to define quark test functions.

```
8305 \cs_new_eq:NN \if_predicate:w \tex_ifodd:D
```

(End of definition for `\if_bool:N` and `\if_predicate:w`. These functions are documented on page 74.)

### 50.2 Defining a set of conditional functions

These are all defined in `l3basics`, as they are needed “early”. This is just a reminder!

(End of definition for `\prg_set_conditional:Npnn` and others. These functions are documented on page 65.)

### 50.3 The boolean data type

```
8306 <@@=bool>
```

Boolean variables have to be initiated when they are created. Other than that there is not much to say here.

```
8307 \cs_new_protected:Npn \bool_new:N #1 { \cs_new_eq:NN #1 \c_false_bool }
8308 \cs_generate_variant:Nn \bool_new:N { c }
```

(End of definition for `\bool_new:N`. This function is documented on page 67.)

`\bool_const:Nn` A merger between `\tl_const:Nn` and `\bool_set:Nn`.

```
\bool_const:cn
8309 \cs_new_protected:Npn \bool_const:Nn #1#2
8310 {
8311   \__kernel_chk_if_free_cs:N #1
8312   \tex_global:D \tex_chardef:D #1 = \bool_if_p:n {#2}
8313 }
8314 \cs_generate_variant:Nn \bool_const:Nn { c }
```

(End of definition for `\bool_const:Nn`. This function is documented on page 67.)

```

\bool_set_true:N Setting is already pretty easy. When check-declarations is active, the definitions are
\bool_set_true:c patched to make sure the boolean exists. This is needed because booleans are not based
\bool_gset_true:N on token lists nor on TEX registers.
\bool_gset_true:c
\bool_set_false:N
\bool_set_false:c
\bool_gset_false:N
\bool_gset_false:c
8315 \cs_new_protected:Npn \bool_set_true:N #1
8316 { \cs_set_eq:NN #1 \c_true_bool }
8317 \cs_new_protected:Npn \bool_set_false:N #1
8318 { \cs_set_eq:NN #1 \c_false_bool }
8319 \cs_new_protected:Npn \bool_gset_true:N #1
8320 { \cs_gset_eq:NN #1 \c_true_bool }
8321 \cs_new_protected:Npn \bool_gset_false:N #1
8322 { \cs_gset_eq:NN #1 \c_false_bool }
8323 \cs_generate_variant:Nn \bool_set_true:N { c }
8324 \cs_generate_variant:Nn \bool_set_false:N { c }
8325 \cs_generate_variant:Nn \bool_gset_true:N { c }
8326 \cs_generate_variant:Nn \bool_gset_false:N { c }

```

(End of definition for `\bool_set_true:N` and others. These functions are documented on page 67.)

```

\bool_set_eq:NN The usual copy code. While it would be cleaner semantically to copy the \cs_set_eq:NN
\bool_set_eq:cN family of functions, we copy \tl_set_eq:NN because that has the correct checking code.
\bool_set_eq:Nc
\bool_set_eq:cc
8327 \cs_new_eq:NN \bool_set_eq:NN \tl_set_eq:NN
8328 \cs_new_eq:NN \bool_gset_eq:NN \tl_gset_eq:NN
\bool_gset_eq:NN
\bool_gset_eq:cN
8329 \cs_generate_variant:Nn \bool_set_eq:NN { Nc, cN, cc }
8330 \cs_generate_variant:Nn \bool_gset_eq:NN { Nc, cN, cc }
\bool_gset_eq:Nc
\bool_gset_eq:cc

```

(End of definition for `\bool_set_eq:NN` and `\bool_gset_eq:NN`. These functions are documented on page 68.)

```

\bool_set:Nn This function evaluates a boolean expression and assigns the first argument the meaning
\bool_set:cn \c_true_bool or \c_false_bool. Again, we include some checking code. It is important
\bool_gset:Nn to evaluate the expression before applying the \chardef primitive, because that primitive
\bool_gset:cn sets the left-hand side to \scan_stop: before looking for the right-hand side.

```

```

8331 \cs_new_protected:Npn \bool_set:Nn #1#2
8332 {
8333   \exp_last_unbraced:NNNf
8334   \tex_chardef:D #1 = { \bool_if_p:n {#2} }

8348 \cs_generate_variant:Nn \bool_gset_inverse:N { c }

```

(End of definition for `\bool_set_inverse:N` and `\bool_gset_inverse:N`. These functions are documented on page 68.)

## 50.4 Internal auxiliaries

`\q__bool_recursion_tail` Internal recursion quarks.

```
\q__bool_recursion_stop 8349 \quark_new:N \q__bool_recursion_tail
                        8350 \quark_new:N \q__bool_recursion_stop
```

(End of definition for `\q__bool_recursion_tail` and `\q__bool_recursion_stop`.)

`\__bool_use_i_delimit_by_q_recursion_stop:nw` Functions to gobble up to a quark.

```
8351 \cs_new:Npn \__bool_use_i_delimit_by_q_recursion_stop:nw
8352   #1 #2 \q__bool_recursion_stop {#1}
```

(End of definition for `\__bool_use_i_delimit_by_q_recursion_stop:nw`.)

`\__bool_if_recursion_tail_stop_do:nn` Functions to query recursion quarks.

```
8353 \__kernel_quark_new_test:N \__bool_if_recursion_tail_stop_do:nn
```

(End of definition for `\__bool_if_recursion_tail_stop_do:nn`.)

`\bool_if_p:N` Straight forward here. We could optimize here if we wanted to as the boolean can just be input directly.

```
\bool_if_p:c
\bool_if:NTF 8354 \prg_new_conditional:Npnn \bool_if:N #1 { p , T , F , TF }
\bool_if:cTF 8355 {
                8356   \if_bool:N #1
                8357     \prg_return_true:
                8358   \else:
                8359     \prg_return_false:
                8360   \fi:
                8361 }
8362 \prg_generate_conditional_variant:Nnn \bool_if:N { c } { p , T , F , TF }
```

(End of definition for `\bool_if:N`. This function is documented on page 68.)

`\bool_to_str:N` Expands to string literal true or false.

```
\bool_to_str:c 8363 \cs_new:Npe \bool_to_str:N #1
\bool_to_str:n 8364 {
                8365   \exp_not:N \bool_if:N {TF} #1
                8366   { \tl_to_str:n { true } } { \tl_to_str:n { false } }
                8367 }
                8368 \cs_generate_variant:Nn \bool_to_str:N { c }
                8369 \cs_new:Npe \bool_to_str:n #1
                8370 {
                8371   \exp_not:N \bool_if:n {TF} {#1}
                8372   { \tl_to_str:n { true } } { \tl_to_str:n { false } }
                8373 }
```

(End of definition for `\bool_to_str:N` and `\bool_to_str:n`. These functions are documented on page 68.)

**\bool\_show:n** Show the truth value of the boolean.

```
\bool_log:n      8374 \cs_new_protected:Npn \bool_show:n
                  8375 { \__kernel_msg_show_eval:Nn \bool_to_str:n }
                  8376 \cs_new_protected:Npn \bool_log:n
                  8377 { \__kernel_msg_log_eval:Nn \bool_to_str:n }
```

*(End of definition for \bool\_show:n and \bool\_log:n. These functions are documented on page 68.)*

**\bool\_show:N** Show the truth value of the boolean, as true or false.

```
\bool_show:c      8378 \cs_new_protected:Npn \bool_show:N { \__bool_show:NN \tl_show:n }
\bool_log:N      8379 \cs_generate_variant:Nn \bool_show:N { c }
\bool_log:c      8380 \cs_new_protected:Npn \bool_log:N { \__bool_show:NN \tl_log:n }
\__bool_show:NN  8381 \cs_generate_variant:Nn \bool_log:N { c }
                  8382 \cs_new_protected:Npn \__bool_show:NN #1#2
                  8383 {
                  8384     \__kernel_chk_defined:NT #2
                  8385     {
                  8386         \token_case_meaning:NnF #2

                  8389             \c_false_bool { \exp_args:Ne #1 { \token_to_str:N #2 = false } }
                  8390         }
                  8391         {
                  8392             \msg_error:nneee { kernel } { bad-type }
                  8393             { \token_to_str:N #2 } { \token_to_meaning:N #2 } { bool }
                  8394         }
                  8395     }
                  8396 }
```

*(End of definition for \bool\_show:N, \bool\_log:N, and \\_\_bool\_show:NN. These functions are documented on page 68.)*

**\l\_tmpa\_bool** A few booleans just if you need them.

```
\l_tmpb_bool      8397 \bool_new:N \l_tmpa_bool
\g_tmpa_bool      8398 \bool_new:N \l_tmpb_bool
\g_tmpb_bool      8399 \bool_new:N \g_tmpa_bool
                  8400 \bool_new:N \g_tmpb_bool
```

*(End of definition for \l\_tmpa\_bool and others. These variables are documented on page 69.)*

**\bool\_if\_exist\_p:N** Copies of the cs functions defined in l3basics.

```
\bool_if_exist_p:c 8401 \prg_new_eq_conditional:NNn \bool_if_exist:N \cs_if_exist:N
\bool_if_exist:NTF 8402 { TF , T , F , p }
\bool_if_exist:cTF 8403 \prg_new_eq_conditional:NNn \bool_if_exist:c \cs_if_exist:c
                  8404 { TF , T , F , p }
```

*(End of definition for \bool\_if\_exist:NTF. This function is documented on page 69.)*

## 50.5 Boolean expressions

`\bool_if_p:n` Evaluating the truth value of a list of predicates is done using an input syntax somewhat similar to the one found in other programming languages with ( and ) for grouping, ! for logical “Not”, && for logical “And” and || for logical “Or”. However, they perform eager evaluation. We shall use the terms Not, And, Or, Open and Close for these operations.

Any expression is terminated by a Close operation. Evaluation happens from left to right in the following manner using a GetNext function:

- If an Open is seen, start evaluating a new expression using the Eval function and call GetNext again.
- If a Not is seen, remove the ! and call a GetNext function with the logic reversed.
- If none of the above, reinsert the token found (this is supposed to be a predicate function) in front of an Eval function, which evaluates it to the boolean value `<true>` or `<false>`.

The Eval function then contains a post-processing operation which grabs the instruction following the predicate. This is either And, Or or Close. In each case the truth value is used to determine where to go next. The following situations can arise:

`<true>`**And** Current truth value is true, logical And seen, continue with GetNext to examine truth value of next boolean (sub-)expression.

`<false>`**And** Current truth value is false, logical And seen, stop using the values of predicates within this sub-expression until the next Close. Then return `<false>`.

`<true>`**Or** Current truth value is true, logical Or seen, stop using the values of predicates within this sub-expression until the nearest Close. Then return `<true>`.

`<false>`**Or** Current truth value is false, logical Or seen, continue with GetNext to examine truth value of next boolean (sub-)expression.

`<true>`**Close** Current truth value is true, Close seen, return `<true>`.

`<false>`**Close** Current truth value is false, Close seen, return `<false>`.

```
8405 \prg_new_conditional:Npnn \bool_if:n #1 { T , F , TF }
8406 {
8407   \if_predicate:w \bool_if_p:n {#1}
8408   \prg_return_true:
8409   \else:
8410   \prg_return_false:
8411   \fi:
8412 }
```

*(End of definition for \bool\_if:nTF. This function is documented on page 70.)*

`\bool_if_p:n` To speed up the case of a single predicate, f-expand and check whether the result is one token (possibly surrounded by spaces), which must be `\c_true_bool` or `\c_false_bool`. We use a version of `\tl_if_single:nTF` optimized for speed since we know that an empty #1 is an error. The auxiliary `__bool_if_p_aux:w` removes the trailing parenthesis and gets rid of any space, then returns `\c_true_bool` or `\c_false_bool` as appropriate. This extra work around is because in a `\bool_set:Nn`, the underlying `\chardef` turns

the bool being set temporarily equal to `\relax`, thus assigning a boolean to itself would fail (gh/1055). For the general case, first issue a `\group_align_safe_begin:` as we are using `&&` as syntax shorthand for the And operation and we need to hide it for T<sub>E</sub>X. This group is closed after `\__bool_get_next:NN` returns `\c_true_bool` or `\c_false_bool`. That function requires the trailing parenthesis to know where the expression ends.

```

8413 \cs_new:Npn \bool_if_p:n { \exp_args:Nf \__bool_if_p:n }
8414 \cs_new:Npn \__bool_if_p:n #1
8415 {
8416   \tl_if_empty:oT { \use_none:nn #1 . } { \__bool_if_p_aux:w }
8417   \group_align_safe_begin:
8418   \exp_after:wN
8419   \group_align_safe_end:
8420   \exp:w \exp_end_continue_f:w % (
8421   \__bool_get_next:NN \use_i:nnnn #1 )
8422 }
8423 \cs_new:Npn \__bool_if_p_aux:w #1 \use_i:nnnn #2#3
8424 { \bool_if:NTF #2 \c_true_bool \c_false_bool }

```

(End of definition for `\bool_if_p:n`, `\__bool_if_p:n`, and `\__bool_if_p_aux:w`. This function is documented on page 70.)

`\__bool_get_next:NN` The GetNext operation. Its first argument is `\use_i:nnnn`, `\use_ii:nnnn`, `\use_iii:nnnn`, or `\use_iv:nnnn` (we call these “states”). In the first state, this function eventually expand to the truth value `\c_true_bool` or `\c_false_bool` of the expression which follows until the next unmatched closing parenthesis. For instance “`\__bool_get_next:NN \use_i:nnnn \c_true_bool && \c_true_bool )`” (including the closing parenthesis) expands to `\c_true_bool`. In the second state (after a `!`) the logic is reversed. We call these two states “normal” and the next two “skipping”. In the third state (after `\c_true_bool||`) it always returns `\c_true_bool`. In the fourth state (after `\c_false_bool&&`) it always returns `\c_false_bool` and also stops when encountering `||`, not only parentheses. This code itself is a switch: if what follows is neither `!` nor `(`, we assume it is a predicate.

```

8425 \cs_new:Npn \__bool_get_next:NN #1#2
8426 {
8427   \use:c
8428   {
8429     __bool_
8430     \if_meaning:w !#2 ! \else: \if_meaning:w (#2 ( \else: p \fi: \fi:
8431     :Nw
8432   }
8433   #1 #2
8434 }

```

(End of definition for `\__bool_get_next:NN`.)

`\__bool_!:Nw` The Not operation reverses the logic: it discards the `!` token and calls the GetNext operation with the appropriate first argument. Namely the first and second states are interchanged, but after `\c_true_bool||` or `\c_false_bool&&` the `!` is ignored.

```

8435 \cs_new:cpn { __bool_!:Nw } #1#2
8436 {
8437   \exp_after:wN \__bool_get_next:NN
8438   #1 \use_ii:nnnn \use_i:nnnn \use_iii:nnnn \use_iv:nnnn
8439 }

```

(End of definition for `\_bool_! :Nw.`)

`\_bool_(:Nw` The Open operation starts a sub-expression after discarding the open parenthesis. This is done by calling `GetNext` (which eventually discards the corresponding closing parenthesis), with a post-processing step which looks for `And`, `Or` or `Close` after the group.

```
8440 \cs_new:cpn { \_bool_(:Nw } #1#2
8441 {
8442   \exp_after:wN \_bool_choose:NNN \exp_after:wN #1
8443   \int_value:w \_bool_get_next:NN \use_i:nnnn
8444 }
```

(End of definition for `\_bool_(:Nw.`)

`\_bool_p:Nw` If what follows `GetNext` is neither `!` nor `(`, evaluate the predicate using the primitive `\int_value:w`. The canonical `true` and `false` values have numerical values 1 and 0 respectively. Look for `And`, `Or` or `Close` afterwards.

```
8445 \cs_new:cpn { \_bool_p:Nw } #1
8446 { \exp_after:wN \_bool_choose:NNN \exp_after:wN #1 \int_value:w }
```

(End of definition for `\_bool_p:Nw.`)

`\_bool_choose:NNN` The arguments are `#1`: a function such as `\use_i:nnnn`, `#2`: 0 or 1 encoding the current truth value, `#3`: the next operation, `And`, `Or` or `Close`. We distinguish three cases according to a combination of `#1` and `#2`. Case 2 is when `#1` is `\use_iii:nnnn` (state 3), namely after `\c_true_bool ||`. Case 1 is when `#1` is `\use_i:nnnn` and `#2` is `true` or when `#1` is `\use_ii:nnnn` and `#2` is `false`, for instance for `!\c_false_bool`. Case 0 includes the same with `true/false` interchanged and the case where `#1` is `\use_iv:nnnn` namely after `\c_false_bool &&`.

`\_bool_)_0:` When seeing `)` the current subexpression is done, leave the appropriate boolean.  
`\_bool_)_1:` When seeing `&` in case 0 go into state 4, equivalent to having seen `\c_false_bool &&`.  
`\_bool_)_2:` In case 1, namely when the argument is `true` and we are in a normal state continue in the normal state 1. In case 2, namely when skipping alternatives in an `Or`, continue in the same state. When seeing `|` in case 0, continue in a normal state; in particular stop skipping for `\c_false_bool &&` because that binds more tightly than `||`. In the other two cases start skipping for `\c_true_bool ||`.

```
8447 \cs_new:Npn \_bool_choose:NNN #1#2#3
8448 {
8449   \use:c
8450   {
8451     \_bool_ \token_to_str:N #3 _
8452     #1 #2 { \if_meaning:w 0 #2 1 \else: 0 \fi: } 2 0 :
8453   }
8454 }
8455 \cs_new:cpn { \_bool_)_0: } { \c_false_bool }
8456 \cs_new:cpn { \_bool_)_1: } { \c_true_bool }
8457 \cs_new:cpn { \_bool_)_2: } { \c_true_bool }
8458 \cs_new:cpn { \_bool_&_0: } & { \_bool_get_next:NN \use_iv:nnnn }
8459 \cs_new:cpn { \_bool_&_1: } & { \_bool_get_next:NN \use_i:nnnn }
8460 \cs_new:cpn { \_bool_&_2: } & { \_bool_get_next:NN \use_iii:nnnn }
8461 \cs_new:cpn { \_bool|_0: } | { \_bool_get_next:NN \use_i:nnnn }
8462 \cs_new:cpn { \_bool|_1: } | { \_bool_get_next:NN \use_iii:nnnn }
8463 \cs_new:cpn { \_bool|_2: } | { \_bool_get_next:NN \use_iii:nnnn }
```

(End of definition for `\_bool_choose:NNN` and others.)

`\bool_lazy_all_p:n` Go through the list of expressions, stopping whenever an expression is `false`. If the end is reached without finding any `false` expression, then the result is `true`.

`\bool_lazy_all:nTF`

`\_bool_lazy_all:n`

```

8464 \cs_new:Npn \bool_lazy_all_p:n #1
8465 { \_bool_lazy_all:n #1 \q_bool_recursion_tail \q_bool_recursion_stop }
8466 \prg_new_conditional:Npnn \bool_lazy_all:n #1 { T , F , TF }
8467 {
8468   \if_predicate:w \bool_lazy_all_p:n {#1}
8469   \prg_return_true:
8470   \else:
8471   \prg_return_false:
8472   \fi:
8473 }
8474 \cs_new:Npn \_bool_lazy_all:n #1
8475 {
8476   \_bool_if_recursion_tail_stop_do:nn {#1} { \c_true_bool }
8477   \bool_if:nF {#1}
8478   { \_bool_use_i_delimit_by_q_recursion_stop:nw { \c_false_bool } }
8479   \_bool_lazy_all:n
8480 }

```

(End of definition for `\bool_lazy_all:nTF` and `\_bool_lazy_all:n`. This function is documented on page 70.)

`\bool_lazy_and_p:nn` Only evaluate the second expression if the first is `true`. Note that `#2` must be removed as an argument, not just by skipping to the `\else:` branch of the conditional since `#2` may contain unbalanced TeX conditionals.

`\bool_lazy_and:nnTF`

```

8481 \prg_new_conditional:Npnn \bool_lazy_and:nn #1#2 { p , T , F , TF }
8482 {
8483   \if_predicate:w
8484   \bool_if:nTF {#1} { \bool_if_p:n {#2} } { \c_false_bool }
8485   \prg_return_true:
8486   \else:
8487   \prg_return_false:
8488   \fi:
8489 }

```

(End of definition for `\bool_lazy_and:nnTF`. This function is documented on page 70.)

`\bool_lazy_any_p:n` Go through the list of expressions, stopping whenever an expression is `true`. If the end is reached without finding any `true` expression, then the result is `false`.

`\bool_lazy_any:nTF`

`\_bool_lazy_any:n`

```

8490 \cs_new:Npn \bool_lazy_any_p:n #1
8491 { \_bool_lazy_any:n #1 \q_bool_recursion_tail \q_bool_recursion_stop }
8492 \prg_new_conditional:Npnn \bool_lazy_any:n #1 { T , F , TF }
8493 {
8494   \if_predicate:w \bool_lazy_any_p:n {#1}
8495   \prg_return_true:
8496   \else:
8497   \prg_return_false:
8498   \fi:
8499 }
8500 \cs_new:Npn \_bool_lazy_any:n #1
8501 {

```

```

8502     \__bool_if_recursion_tail_stop_do:nn {#1} { \c_false_bool }
8503     \bool_if:nT {#1}
8504         { \__bool_use_i_delimit_by_q_recursion_stop:nw { \c_true_bool } }
8505     \__bool_lazy_any:n
8506 }

```

(End of definition for \bool\_lazy\_any:nTF and \\_\_bool\_lazy\_any:n. This function is documented on page 71.)

**\bool\_lazy\_or\_p:nn** Only evaluate the second expression if the first is false.

```

\bool_lazy_or:nnTF
8507 \prg_new_conditional:Npnn \bool_lazy_or:nn #1#2 { p , T , F , TF }
8508 {
8509     \if_predicate:w
8510         \bool_if:nTF {#1} { \c_true_bool } { \bool_if_p:n {#2} }
8511     \prg_return_true:
8512 \else:
8513     \prg_return_false:
8514 \fi:
8515 }

```

(End of definition for \bool\_lazy\_or:nnTF. This function is documented on page 71.)

**\bool\_not\_p:n** The Not variant just reverses the outcome of \bool\_if\_p:n. Can be optimized but this is nice and simple and according to the implementation plan. Not even particularly useful to have it when the infix notation is easier to use.

```

8516 \cs_new:Npn \bool_not_p:n #1 { \bool_if_p:n { ! ( #1 ) } }

```

(End of definition for \bool\_not\_p:n. This function is documented on page 71.)

**\bool\_xor\_p:nn** Exclusive or. If the boolean expressions have same truth value, return false, otherwise  
**\bool\_xor:nnTF** return true.

```

8517 \prg_new_conditional:Npnn \bool_xor:nn #1#2 { p , T , F , TF }
8518 {
8519     \bool_if:nT {#1} \reverse_if:N
8520     \if_predicate:w \bool_if_p:n {#2}
8521     \prg_return_true:
8522 \else:
8523     \prg_return_false:
8524 \fi:
8525 }

```

(End of definition for \bool\_xor:nnTF. This function is documented on page 71.)

## 50.6 Logical loops

**\bool\_while\_do:Nn** A while loop where the boolean is tested before executing the statement. The “while”  
**\bool\_while\_do:cn** version executes the code as long as the boolean is true; the “until” version executes the  
**\bool\_until\_do:Nn** code as long as the boolean is false.

```

\bool_until_do:cn
8526 \cs_new:Npn \bool_while_do:Nn #1#2
8527 { \bool_if:NT #1 { #2 \bool_while_do:Nn #1 {#2} } }
8528 \cs_new:Npn \bool_until_do:Nn #1#2
8529 { \bool_if:NF #1 { #2 \bool_until_do:Nn #1 {#2} } }
8530 \cs_generate_variant:Nn \bool_while_do:Nn { c }
8531 \cs_generate_variant:Nn \bool_until_do:Nn { c }

```

(End of definition for `\bool_while_do:Nn` and `\bool_until_do:Nn`. These functions are documented on page 71.)

`\bool_do_while:Nn` A do-while loop where the body is performed at least once and the boolean is tested after executing the body. Otherwise identical to the above functions.  
`\bool_do_while:cn`  
`\bool_do_until:Nn`  
`\bool_do_until:cn`

```

8532 \cs_new:Npn \bool_do_while:Nn #1#2
8533   { #2 \bool_if:NT #1 { \bool_do_while:Nn #1 {#2} } }
8534 \cs_new:Npn \bool_do_until:Nn #1#2
8535   { #2 \bool_if:NF #1 { \bool_do_until:Nn #1 {#2} } }
8536 \cs_generate_variant:Nn \bool_do_while:Nn { c }
8537 \cs_generate_variant:Nn \bool_do_until:Nn { c }

```

(End of definition for `\bool_do_while:Nn` and `\bool_do_until:Nn`. These functions are documented on page 71.)

`\bool_while_do:nn` Loop functions with the test either before or after the first body expansion.  
`\bool_do_while:nn`  
`\bool_until_do:nn`  
`\bool_do_until:nn`

```

8538 \cs_new:Npn \bool_while_do:nn #1#2
8539   {
8540     \bool_if:nT {#1}
8541     {
8542       #2
8543       \bool_while_do:nn {#1} {#2}
8544     }
8545   }
8546 \cs_new:Npn \bool_do_while:nn #1#2
8547   {
8548     #2
8549     \bool_if:nT {#1} { \bool_do_while:nn {#1} {#2} }
8550   }
8551 \cs_new:Npn \bool_until_do:nn #1#2
8552   {
8553     \bool_if:nF {#1}
8554     {
8555       #2
8556       \bool_until_do:nn {#1} {#2}
8557     }
8558   }
8559 \cs_new:Npn \bool_do_until:nn #1#2
8560   {
8561     #2
8562     \bool_if:nF {#1} { \bool_do_until:nn {#1} {#2} }
8563   }

```

(End of definition for `\bool_while_do:nn` and others. These functions are documented on page 72.)

`\s__bool_mark` Internal scan marks.

`\s__bool_stop`

```

8564 \scan_new:N \s__bool_mark
8565 \scan_new:N \s__bool_stop

```

(End of definition for `\s__bool_mark` and `\s__bool_stop`.)

`\bool_case:n` For boolean cases the overall idea is the same as for `\str_case:nnTF` as described in l3str.  
`\bool_case:nTF`

```

__bool_case:NnTF 8566 \cs_new:Npn \bool_case:nTF
__bool_case:w    8567   { \exp:w __bool_case:nTF }
a\__bool_case_end:nw

```

```

8568 \cs_new:Npn \bool_case:nT #1#2
8569   { \exp:w \__bool_case:nTF {#1} {#2} { } }
8570 \cs_new:Npn \bool_case:nF #1
8571   { \exp:w \__bool_case:nTF {#1} { } }
8572 \cs_new:Npn \bool_case:n #1
8573   { \exp:w \__bool_case:nTF {#1} { } { } }
8574 \cs_new:Npn \__bool_case:nTF #1#2#3
8575   {
8576     \__bool_case:w
8577     #1 \c_true_bool { } \s__bool_mark {#2} \s__bool_mark {#3} \s__bool_stop
8578   }
8579 \cs_new:Npn \__bool_case:w #1#2
8580   {
8581     \bool_if:nTF {#1}
8582       { \__bool_case_end:nw {#2} }
8583       { \__bool_case:w }
8584   }
8585 \cs_new:Npn \__bool_case_end:nw #1#2#3 \s__bool_mark #4#5 \s__bool_stop
8586   { \exp_end: #1 #4 }

```

(End of definition for `\bool_case:nTF` and others. This function is documented on page 73.)

## 50.7 Producing multiple copies

```

8587 <@@=prg>

```

`\prg_replicate:nn`

This function uses a cascading csname technique by David Kastrup (who else :-)

`\__prg_replicate:N`

The idea is to make the input 25 result in first adding five, and then 20 copies of the code to be replicated. The technique uses cascading csnames which means that we start building several csnames so we end up with a list of functions to be called in reverse order. This is important here (and other places) because it means that we can for instance make the function that inserts five copies of something to also hand down ten to the next function in line. This is exactly what happens here: in the example with 25 then the next function is the one that inserts two copies but it sees the ten copies handed down by the previous function. In order to avoid the last function to insert say, 100 copies of the original argument just to gobble them again we define separate functions to be inserted first. These functions also close the expansion of `\exp:w`, which ensures that `\prg_replicate:nn` only requires two steps of expansion.

This function has one flaw though: Since it constantly passes down ten copies of its previous argument it severely affects the main memory once you start demanding hundreds of thousands of copies. Now I don't think this is a real limitation for any ordinary use, and if necessary, it is possible to write `\prg_replicate:nn {1000} { \prg_replicate:nn {1000} {<code>} }`. An alternative approach is to create a string of m's with `\exp:w` which can be done with just four macros but that method has its own problems since it can exhaust the string pool. Also, it is considerably slower than what we use here so the few extra csnames are well spent I would say.

```

\__prg_replicate_0:n
\__prg_replicate_1:n
\__prg_replicate_2:n
\__prg_replicate_3:n
\__prg_replicate_4:n
\__prg_replicate_5:n
\__prg_replicate_6:n
\__prg_replicate_7:n
\__prg_replicate_8:n
\__prg_replicate_9:n
\__prg_replicate_first_0:n
\__prg_replicate_first_1:n
\__prg_replicate_first_2:n
\__prg_replicate_first_3:n
\__prg_replicate_first_4:n
\__prg_replicate_first_5:n
\__prg_replicate_first_6:n
\__prg_replicate_first_7:n
\__prg_replicate_first_8:n
\__prg_replicate_first_9:n

```

```

8588 \cs_new:Npn \prg_replicate:nn #1
8589   {
8590     \exp:w
8591       \exp_after:wN \__prg_replicate_first:N
8592       \int_value:w \int_eval:n {#1}
8593       \cs_end:

```

conditionals for this and gobbling the `\exp_end:` in the input stream. However this requires knowledge of the implementation so we keep things nice and clean and use the return statements.

```
8636 \prg_new_conditional:Npnn \mode_if_vertical: { p , T , F , TF }
8637 { \if_mode_vertical: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_vertical:TF`. This function is documented on page 74.)

`\mode_if_horizontal_p:` For testing horizontal mode.

```
\mode_if_horizontal:TF 8638 \prg_new_conditional:Npnn \mode_if_horizontal: { p , T , F , TF }
8639 { \if_mode_horizontal: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_horizontal:TF`. This function is documented on page 73.)

`\mode_if_inner_p:` For testing inner mode.

```
\mode_if_inner:TF 8640 \prg_new_conditional:Npnn \mode_if_inner: { p , T , F , TF }
8641 { \if_mode_inner: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_inner:TF`. This function is documented on page 73.)

`\mode_if_math_p:` For testing math mode. At the beginning of an alignment cell, this should be used only inside a non-expandable function.

```
8642 \prg_new_conditional:Npnn \mode_if_math: { p , T , F , TF }
8643 { \if_mode_math: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_math:TF`. This function is documented on page 74.)

## 50.9 Internal programming functions

`\group_align_safe_begin:` `\group_align_safe_end:` T<sub>E</sub>X’s alignment structures present many problems. As Knuth says himself in *T<sub>E</sub>X: The Program*: “It’s sort of a miracle whenever `\halign` or `\valign` work, [...]” One problem relates to commands that internally issue a `\cr` but also peek ahead for the next character for use in, say, an optional argument. If the next token happens to be a `&` with category code 4 we get some sort of weird error message because the underlying `\futurelet` stores the token at the end of the alignment template. This could be a `&4` giving a message like `! Misplaced \cr.` or even worse: it could be the `\endtemplate` token causing even more trouble! To solve this we have to open a special group so that T<sub>E</sub>X still thinks it’s on safe ground but at the same time we don’t want to introduce any brace group that may find its way to the output. The following functions help with this by using behaviour documented only in Appendix D of *The T<sub>E</sub>Xbook*. ...In short evaluating ‘{ and ‘} as numbers will not change the counter T<sub>E</sub>X uses to keep track of its state in an alignment, whereas gobbling a brace using `\if_false:` will affect T<sub>E</sub>X’s state without producing any real group. We place the `\if_false: { \fi:` part at that place so that the successive expansions of `\group_align_safe_begin/end:` are always brace balanced.

```
8644 \group_begin:
8645 \tex_catcode:D ‘\^^@ = 2 \exp_stop_f:
8646 \cs_new:Npn \group_align_safe_begin:
8647 { \exp:w \if_false: { \fi: ‘^^@ \exp_stop_f: }
8648 \tex_catcode:D ‘\^^@ = 1 \exp_stop_f:
8649 \cs_new:Npn \group_align_safe_end:
8650 { \exp:w ‘^^@ \if_false: } \fi: \exp_stop_f: }
8651 \group_end:
```

*(End of definition for `\group_align_safe_begin:` and `\group_align_safe_end:`. These functions are documented on page 75.)*

`\g__kernel_prg_map_int` A nesting counter for mapping.

8652 `\int_new:N \g__kernel_prg_map_int`

*(End of definition for `\g__kernel_prg_map_int:`.)*

`\prg_break_point:Nn` These are defined in `l3basics`, as they are needed “early”. This is just a reminder that is the case!  
`\prg_map_break:Nn`

*(End of definition for `\prg_break_point:Nn` and `\prg_map_break:Nn`. These functions are documented on page 74.)*

`\prg_break_point:` Also done in `l3basics`.

`\prg_break:`

`\prg_break:n`

*(End of definition for `\prg_break_point:`, `\prg_break:`, and `\prg_break:n`. These functions are documented on page 75.)*

8653 `</code>`

# Chapter 51

## l3sys implementation

```
8654 <@@=sys>
```

### 51.1 Kernel code

```
8655 <*code>
```

```
\l__sys_tmp_tl
```

```
8656 \tl_new:N \l__sys_tmp_tl
```

*(End of definition for \l\_\_sys\_tmp\_tl.)*

#### 51.1.1 Detecting the engine

`\__sys_const:nn` Set the T, F, TF, p forms of #1 to be constants equal to the result of evaluating the boolean expression #2.

```
8657 \cs_new_protected:Npn \__sys_const:nn #1#2
8658 {
8659   \bool_if:nTF {#2}
8660   {
8661     \cs_new_eq:cN { #1 :T } \use:n
8662     \cs_new_eq:cN { #1 :F } \use_none:n
8663     \cs_new_eq:cN { #1 :TF } \use_i:nn
8664     \cs_new_eq:cN { #1 _p: } \c_true_bool
8665   }
8666   {
8667     \cs_new_eq:cN { #1 :T } \use_none:n
8668     \cs_new_eq:cN { #1 :F } \use:n
8669     \cs_new_eq:cN { #1 :TF } \use_ii:nn
8670     \cs_new_eq:cN { #1 _p: } \c_false_bool
8671   }
8672 }
```

*(End of definition for \\_\_sys\_const:nn.)*

`\sys_if_engine luatex_p:` Set up the engine tests on the basis exactly one test should be true. Mainly a case of looking for the appropriate marker primitive.

```
\sys_if_engine luatex:TF
\sys_if_engine pdftex_p:
\sys_if_engine pdftex:TF
\sys_if_engine ptex_p:
\sys_if_engine ptex:TF
\sys_if_engine uptex_p:
\sys_if_engine uptex:TF
\sys_if_engine xetex_p:
\sys_if_engine xetex:TF
\c_sys_engine_str
```

```

8675 \cs_if_exist:NT \tex luatexversion:D { luatex }
8676 \cs_if_exist:NT \tex pdftexversion:D { pdftex }
8677 \cs_if_exist:NT \tex kanjiskip:D
8678 {
8679   \cs_if_exist:NTF \tex enablecjktoken:D
8680     { uptex }
8681     { ptex }
8682   }
8683 \cs_if_exist:NT \tex XeTeXversion:D { xetex }
8684 }
8685 \tl_map_inline:nn { { luatex } { pdftex } { ptex } { uptex } { xetex } }
8686 {
8687   \__sys_const:nn { sys_if_engine_ #1 }
8688   { \str_if_eq_p:Vn \c_sys_engine_str {#1} }
8689 }

```

(End of definition for `\sys_if_engine luatex:TF` and others. These functions are documented on page 77.)

---

```

\sys_if_engine_opentype_p: ★
\sys_if_engine_opentype:TF ★

```

---

```

8690 \__sys_const:nn
8691 { sys_if_engine_opentype }
8692 { \cs_if_exist_p:N \tex_Umathcode:D }

```

`\c_sys_engine_exec_str`  
`\c_sys_engine_format_str`

Take the functions defined above, and set up the engine and format names. `\c_sys_engine_exec_str` differs from `\c_sys_engine_str` as it is the *actual* engine name, not a “filtered” version. It differs for `ptex` and `uptex`, which have a leading `e`, and for `luatex`, because L<sup>A</sup>T<sub>E</sub>X uses the LuaH<sup>B</sup>T<sub>E</sub>X engine.

`\c_sys_engine_format_str` is quite similar to `\c_sys_engine_str`, except that it differentiates `pdflatex` from `latex` (which is pdf<sub>T</sub>E<sub>X</sub> in DVI mode). This differentiation, however, is reliable only if the user doesn’t change `\tex_pdfoutput:D` before loading this code.

```

8693 \group_begin:
8694   \cs_set_eq:NN \lua_now:e \tex_directlua:D

```

(End of definition for `\c_sys_engine_version_str`. This variable is documented on page 78.)

## 51.1.2 Platform

`\sys_if_platform_unix_p:` Setting these up requires the file module (file lookup), so is actually implemented there.

`\sys_if_platform_unix:TF`

`\sys_if_platform_windows_p:`

`\sys_if_platform_windows:TF`

`\c_sys_platform_str`

(End of definition for `\sys_if_platform_unix:TF`, `\sys_if_platform_windows:TF`, and `\c_sys_platform_str`. These functions are documented on page 79.)

### 51.1.3 Configurations

Loading the backend code is pretty simply: check that the backend is valid, then load it up.

`\sys_load_backend:n`

`\__sys_load_backend_check:N`

`\c_sys_backend_str`

```

8802 \cs_new_protected:Npn \sys_load_backend:n #1
8803 {
8804   \sys_finalise:
8805   \str_if_exist:NTF \c_sys_backend_str
8806   {
8807     \str_if_eq:VnF \c_sys_backend_str {#1}
8808     { \msg_error:nn { sys } { backend-set } }
8809   }
8810   {
8811     \tl_if_blank:nF {#1}
8812     { \tl_gset:Nn \g__sys_backend_tl {#1} }
8813     \__sys_load_backend_check:N \g__sys_backend_tl
8814     \str_const:Ne \c_sys_backend_str { \g__sys_backend_tl }
8815     \__kernel_sys_configuration_load:n
8816     { l3backend- \c_sys_backend_str }
8817   }
8818 }
8819 \cs_new_protected:Npn \__sys_load_backend_check:N #1
8820 {
8821   \sys_if_engine_xetex:TF
8822   {
8823     \str_case:VnF #1
8824     {
8825       { dvisvgm } { }
8826       { xdvipdfmx } { \tl_gset:Nn #1 { xetex } }
8827       { xetex } { }
8828     }
8829     {
8830       \msg_error:nnee { sys } { wrong-backend }
8831       #1 { xetex }
8832       \tl_gset:Nn #1 { xetex }
8833     }
8834   }
8835   {
8836     \sys_if_output_pdf:TF
8837     {
8838       \str_if_eq:VnTF #1 { pdfmode }
8839       {
8840         \sys_if_engine luatex:TF
8841         { \tl_gset:Nn #1 { luatex } }
8842         { \tl_gset:Nn #1 { pdftex } }
8843       }
8844       {
8845         \bool_lazy_or:nnF
8846         { \str_if_eq_p:Vn #1 { luatex } }
8847         { \str_if_eq_p:Vn #1 { pdftex } }
8848         {
8849           \msg_error:nnee { sys } { wrong-backend }
8850           #1 { \sys_if_engine luatex:TF { luatex } { pdftex } }
8851           \sys_if_engine luatex:TF

```

```

8852             { \tl_gset:Nn #1 { luatex } }
8853             { \tl_gset:Nn #1 { pdftex } }
8854         }
8855     }
8856 }
8857 {
8858     \str_case:NnF #1
8859     {
8860         { dvipdfmx } { }
8861         { dvips } { }
8862         { dvisvgm } { }
8863     }
8864     {
8865         \msg_error:nnee { sys } { wrong-backend }
8866         #1 { dvips }
8867         \tl_gset:Nn #1 { dvips }
8868     }
8869 }
8870 }
8871 }

```

(End of definition for `\sys_load_backend:n`, `\__sys_load_backend_check:N`, and `\c_sys_backend_str`. These functions are documented on page 82.)

**`\sys_ensure_backend:`** A simple wrapper.

```

8872 \cs_new_protected:Npn \sys_ensure_backend:
8873 {
8874     \str_if_exist:NF \c_sys_backend_str
8875     { \sys_load_backend:n { } }
8876 }

```

(End of definition for `\sys_ensure_backend:`. This function is documented on page 82.)

`\g__sys_debug_bool`

```

8877 \bool_new:N \g__sys_debug_bool

```

(End of definition for `\g__sys_debug_bool`.)

**`\sys_load_debug:`** The most complicated thing here is that we can only use `\__kernel_sys_configuration_load:n` in the preamble in L<sup>A</sup>T<sub>E</sub>X.

```

8878 \cs_new_protected:Npn \sys_load_debug:
8879 {
8880     \bool_if:NF \g__sys_debug_bool
8881     { \__kernel_sys_configuration_load:n { l3debug } }
8882     \bool_gset_true:N \g__sys_debug_bool
8883 }
8884 \cs_if_exist:NT \@expl@finalise@setup@@
8885 {
8886     \tl_gput_right:Nn \@expl@finalise@setup@@
8887     {
8888         \tl_gput_right:Nn \@kernel@after@begindocument
8889         {
8890             \cs_gset_protected:Npn \sys_load_debug:
8891             { \msg_error:nn { sys } { load-debug-in-preamble } }
8892         }
8893     }
8894 }

```

```

8893     }
8894 }

```

(End of definition for `\sys_load_debug`:. This function is documented on page 82.)

#### 51.1.4 Access to the shell

`\c__sys_marker_tl` The same idea as the marker for rescanning token lists.

```

8895 \tl_const:Ne \c__sys_marker_tl { : \token_to_str:N : }

```

(End of definition for `\c__sys_marker_tl`.)

`\sys_get_shell:nnNTF` Setting using a shell is at this level just a slightly specialised file operation, with an additional check for quotes, as these are not supported.

```

\sys_get_shell:nnN
  \__sys_get:nnN
  \__sys_get_do:Nw
8896 \cs_new_protected:Npn \sys_get_shell:nnN #1#2#3
8897 {
8898   \sys_get_shell:nnNF {#1} {#2} #3
8899   { \tl_set:Nn #3 { \q_no_value } }
8900 }
8901 \prg_new_protected_conditional:Npnn \sys_get_shell:nnN #1#2#3 { T , F , TF }
8902 {
8903   \sys_if_shell:TF
8904   { \exp_args:No \__sys_get:nnN { \tl_to_str:n {#1} } {#2} #3 }
8905   { \prg_return_false: }
8906 }
8907 \cs_new_protected:Npn \__sys_get:nnN #1#2#3
8908 {
8909   \tl_if_in:nnTF {#1} { " }
8910   {
8911     \msg_error:nne
8912     { kernel } { quote-in-shell } {#1}
8913     \prg_return_false:
8914   }
8915   {
8916     \group_begin:
8917     \if_false: { \fi:
8918       \int_set_eq:NN \tex_tracingnesting:D \c_zero_int
8919       \exp_args:No \tex_everyeof:D { \c__sys_marker_tl }
8920       #2 \scan_stop:
8921       \exp_after:wN \__sys_get_do:Nw
8922       \exp_after:wN #3
8923       \exp_after:wN \prg_do_nothing:
8924       \tex_input:D | "#1" \scan_stop:
8925     \if_false: } \fi:
8926     \prg_return_true:
8927   }
8928 }
8929 \exp_args:Nno \use:nn
8930 { \cs_new_protected:Npn \__sys_get_do:Nw #1#2 }
8931 { \c__sys_marker_tl }
8932 {

8999 \cs_generate_variant:Nn \sys_shell_shipout:n { e , x }

```

(End of definition for `\sys_shell_shipout:n` and `\__sys_shell_shipout:e`. This function is documented on page 81.)

## 51.2 Dynamic (every job) code

```

\__kernel_sys_everyjob:
  \__sys_everyjob:n
  \g__sys_everyjob_tl
9000 \cs_new_protected:Npn \__kernel_sys_everyjob:
9001 {
9002     \tl_use:N \g__sys_everyjob_tl
9003     \tl_gclear:N \g__sys_everyjob_tl
9004 }
9005 \cs_new_protected:Npn \__sys_everyjob:n #1
9006 { \tl_gput_right:Nn \g__sys_everyjob_tl {#1} }
9007 \tl_new:N \g__sys_everyjob_tl

```

(End of definition for `\__kernel_sys_everyjob:`, `\__sys_everyjob:n`, and `\g__sys_everyjob_tl`.)

### 51.2.1 The name of the job

`\c_sys_jobname_str` Inherited from the L<sup>A</sup>T<sub>E</sub>X3 name for the primitive. This *has* to be the primitive as it's set in `\everyjob`. If the user does

```
pdflatex \input some-file-name
```

then `\everyjob` is inserted *before* `\jobname` is changed from `texput`, and thus we would have the wrong result.

```

9008 \__sys_everyjob:n
9009 { \cs_new_eq:NN \c_sys_jobname_str \tex_jobname:D }

```

(End of definition for `\c_sys_jobname_str`. This variable is documented on page 76.)

## 51.2.2 Time and date

`\c_sys_minute_int` `\c_sys_hour_int` `\c_sys_day_int` `\c_sys_month_int` `\c_sys_year_int` Copies of the information provided by T<sub>E</sub>X. There is a lot of defensive code in package mode: someone may have moved the primitives, and they can only be recovered if we have `\primitive` and it is working correctly. For IniT<sub>E</sub>X of course that is all redundant but does no harm.

```

9010 \__sys_everyjob:n
9011 {
9012   \group_begin:
9013   \cs_set:Npn \__sys_tmp:w #1
9014   {
9015     \str_if_eq:eeTF { \cs_meaning:N #1 } { \token_to_str:N #1 }
9016     { #1 }
9017     {
9018       \cs_if_exist:NTF \tex_primitive:D
9019       {
9020         \bool_lazy_and:nnTF
9021         { \sys_if_engine_xetex_p: }
9022         {
9023           \int_compare_p:nNn
9024           { \exp_after:wN \use_none:n \tex_XeTeXrevision:D }
9025           < { 99999 }
9026         }
9027         { 0 }
9028         { \tex_primitive:D #1 }
9029       }
9030       { 0 }
9031     }
9032   }
9033   \int_const:Nn \c_sys_minute_int
9034   { \int_mod:nn { \__sys_tmp:w \time } { 60 } }
9035   \int_const:Nn \c_sys_hour_int
9036   { \int_div_truncate:nn { \__sys_tmp:w \time } { 60 } }
9037   \int_const:Nn \c_sys_day_int { \__sys_tmp:w \day }
9038   \int_const:Nn \c_sys_month_int { \__sys_tmp:w \month }
9039   \int_const:Nn \c_sys_year_int { \__sys_tmp:w \year }
9040   \group_end:
9041 }

```

(End of definition for `\c_sys_minute_int` and others. These variables are documented on page 76.)

`\c_sys_timestamp_str` A simple expansion: LuaT<sub>E</sub>X chokes if we use `\pdffeedback` here, hence the direct use of Lua. Notice that the function there is in the pdf library but isn't actually tied to PDF.

```

9042 \__sys_everyjob:n
9043 {
9044   \str_const:Ne \c_sys_timestamp_str
9045   {
9046     \cs_if_exist:NTF \tex_directlua:D
9047     { \tex_directlua:D { tex.print(pdf.getcreationdate()) } }
9048     { \tex_creationdate:D }
9049   }
9050 }

```

(End of definition for `\c_sys_timestamp_str`. This variable is documented on page 76.)

### 51.2.3 Random numbers

`\sys_rand_seed:` Unpack the primitive.

```

9051 \__sys_everyjob:n
9052 {
9053   \cs_new:Npn \sys_rand_seed: { \tex_the:D \tex_randomseed:D }
9054 }
```

(End of definition for `\sys_rand_seed:`. This function is documented on page 79.)

`\sys_gset_rand_seed:n` The primitive always assigns the seed globally.

```

9055 \__sys_everyjob:n
9056 {
9057   \cs_new_protected:Npn \sys_gset_rand_seed:n #1
9058     { \tex_setrandomseed:D \int_eval:n {#1} \exp_stop_f: }
9059 }
```

(End of definition for `\sys_gset_rand_seed:n`. This function is documented on page 79.)

`\sys_timer:` In LuaTeX, create a pseudo-primitive, otherwise try to locate the real primitive. The elapsed time will be available if this succeeds.

```

\__sys_elapsedtime:
\sys_if_timer_exist_p:
\sys_if_timer_exist:TF
9060 </code>
9061 <lua>
9062   local gettimeofday = os.gettimeofday
9063   local epoch = gettimeofday() - os.clock()
9064   local write = tex.write
9065   local tointeger = math.tointeger
9066   luacmd('__sys_elapsedtime:', function()
9067     write(tointeger((gettimeofday() - epoch)*65536 // 1))
9068   end, 'global')
9069 </lua>
9070 <code>
9071 \cs_new:Npe \sys_timer:
9072 {
9073   \sys_if_engine luatex:TF
9074     { \exp_not:N \__sys_elapsedtime: }
9075     { \exp_not:N \int_value:w \exp_not:N \tex_elapsedtime:D }
9076 }
```

(End of definition for `\sys_timer:`, `\__sys_elapsedtime:`, and `\sys_if_timer_exist:TF`. These functions are documented on page 78.)

### 51.2.4 Access to the shell

`\c_sys_shell_escape_int` Expose the engine's shell escape status to the user.

```

9077 \__sys_everyjob:n
9078 {
9079   \int_const:Nn \c_sys_shell_escape_int
9080     {
9081       \sys_if_engine luatex:TF
9082         {
9083           \tex_directlua:D
```

```

9084         { tex.sprint(status.shell_escape~or~os.execute()) }
9085     }
9086     { \tex_shellescape:D }
9087 }
9088 }

```

(End of definition for `\c_sys_shell_escape_int`. This variable is documented on page 80.)

`\sys_if_shell_p:` Performs a check for whether shell escape is enabled. The first set of functions returns true if either of restricted or unrestricted shell escape is enabled, while the other two sets of functions return true in only one of these two cases.

```

\sys_if_shell:TF
\sys_if_shell_unrestricted_p:
\sys_if_shell_unrestricted:TF
\sys_if_shell_restricted_p:
\sys_if_shell_restricted:TF
9089 \__sys_everyjob:n
9090 {
9091     \__sys_const:nn { sys_if_shell }
9092     { \int_compare_p:nNn \c_sys_shell_escape_int > 0 }
9093     \__sys_const:nn { sys_if_shell_unrestricted }
9094     { \int_compare_p:nNn \c_sys_shell_escape_int = 1 }
9095     \__sys_const:nn { sys_if_shell_restricted }
9096     { \int_compare_p:nNn \c_sys_shell_escape_int = 2 }
9097 }

```

(End of definition for `\sys_if_shell:TF`, `\sys_if_shell_unrestricted:TF`, and `\sys_if_shell_restricted:TF`. These functions are documented on page 80.)

## 51.3 System queries

`\sys_get_query:nN` Calling the query system is quite straight-forward: most of the effort is in making the read-back catcode-safe. We also want to trim off the trailing  $\sim$  from the last line.

```

\sys_get_query:nnN
\sys_get_query:nnnN
\__sys_get_query_auxi:nnnN
\__sys_get_query_auxi:neeN
\__sys_get_query_auxii:nnnN
\__sys_get_query_auxii:neeN
9098 \cs_new_protected:Npn \sys_get_query:nN #1#2
9099 { \sys_get_query:nnnN {#1} { } { } #2 }
9100 \cs_new_protected:Npn \sys_get_query:nnN #1#2#3
9101 { \sys_get_query:nnnN {#1} { } {#2} #3 }

9168       \sys_get_query:nnnN {#1} {#2} {#3} \l__sys_tmp_tl
9169       \tl_if_empty:NF \l__sys_tmp_tl
9170       { \seq_set_split:NnV #4 * \l__sys_tmp_tl }
9171     }
9172   }

```

(End of definition for `\sys_split_query:nN`, `\sys_split_query:nnN`, and `\sys_split_query:nnnN`. These functions are documented on page 81.)

### 51.3.1 Held over from l3file

`\g_file_curr_name_str` See comments about `\c_sys_jobname_str`: here, as soon as there is file input/output, things get “tidied up”.

```
9173 \__sys_everyjob:n
9174 { \cs_gset_eq:NN \g_file_curr_name_str \tex_jobname:D }
```

(End of definition for `\g_file_curr_name_str`. This variable is documented on page 102.)

## 51.4 Last-minute code

`\sys_finalise:` A simple hook to finalise the system-dependent layer. This is forced by the backend loader, which is forced by the main loader, so we do not need to include that here.

```
\__sys_finalise:n
\g_sys_finalise_tl
9175 \cs_new_protected:Npn \sys_finalise:
9176 {
9177   \__kernel_sys_everyjob:
9178   \tl_use:N \g__sys_finalise_tl
9179   \tl_gclear:N \g__sys_finalise_tl
9180 }
9181 \cs_new_protected:Npn \__sys_finalise:n #1
9182 { \tl_gput_right:Nn \g__sys_finalise_tl {#1} }
9183 \tl_new:N \g__sys_finalise_tl
```

(End of definition for `\sys_finalise:`, `\__sys_finalise:n`, and `\g_sys_finalise_tl`. This function is documented on page 82.)

### 51.4.1 Detecting the output

`\sys_if_output_dvi_p:` This is a simple enough concept: the two views here are complementary.

```
\sys_if_output_dvi:TF
\sys_if_output_pdf_p:
\sys_if_output_pdf:TF
\c_sys_output_str
9184 \__sys_finalise:n
9185 {
9186   \str_const:Ne \c_sys_output_str
9187   {
9188     \int_compare:nNnTF
9189     { \cs_if_exist_use:NF \tex_pdfoutput:D { 0 } } > { 0 }
9190     { pdf }
9191     { dvi }
9192   }
9193   \__sys_const:nn { sys_if_output_dvi }
9194   { \str_if_eq_p:Vn \c_sys_output_str { dvi } }
9195   \__sys_const:nn { sys_if_output_pdf }
9196   { \str_if_eq_p:Vn \c_sys_output_str { pdf } }
9197 }
```

(End of definition for `\sys_if_output_dvi:TF`, `\sys_if_output_pdf:TF`, and `\c_sys_output_str`. These functions are documented on page 78.)

## 51.4.2 Configurations

`\g__sys_backend_tl` As the backend has to be checked and possibly adjusted, the approach here is to create a variable and use that in a one-shot to set a constant.

```

9198 \tl_new:N \g__sys_backend_tl
9199 \__sys_finalise:n
9200 {
9201   \__kernel_tl_gset:Nx \g__sys_backend_tl
9202   {
9203     \sys_if_engine_xetex:TF
9204     { xetex }
9205     {
9206       \sys_if_output_pdf:TF
9207       {
9208         \sys_if_engine_pdftex:TF
9209         { pdftex }
9210         { luatex }
9211       }
9212       { dvips }
9213     }
9214   }
9215 }
```

If there is a class option set, and recognised, we pick it up: these will over-ride anything set automatically but will themselves be over-written if there is a package option.

```

9216 \__sys_finalise:n
9217 {
9218   \cs_if_exist:NT \@classoptionslist
9219   {
9220     \cs_if_eq:NNF \@classoptionslist \scan_stop:
9221     {
9222       \clist_map_inline:Nn \@classoptionslist
9223       {
9224         \str_case:nnT {#1}
9225         {
9226           { dvipdfmx }
9227           { \tl_gset:Nn \g__sys_backend_tl { dvipdfmx } }
9228           { dvips }
9229           { \tl_gset:Nn \g__sys_backend_tl { dvips } }
9230           { dvisvgm }
9231           { \tl_gset:Nn \g__sys_backend_tl { dvisvgm } }
9232           { pdftex }
9233           { \tl_gset:Nn \g__sys_backend_tl { pdfmode } }
9234           { xetex }
9235           { \tl_gset:Nn \g__sys_backend_tl { xdvipdfmx } }
9236         }
9237         { \clist_remove_all:Nn \@unusedoptionlist {#1} }
9238       }
9239     }
9240   }
9241 }
```

*(End of definition for `\g__sys_backend_tl`.)*

```

9242 </code>
```

## Chapter 52

# l3msg implementation

```
9243 \code
9244 \msg
\l__msg_tmp_tl A general scratch for the module.
9245 \tl_new:N \l__msg_tmp_tl
(End of definition for \l__msg_tmp_tl.)
\l__msg_name_str Used to save module info when creating messages.
\l__msg_text_str
9246 \str_new:N \l__msg_name_str
9247 \str_new:N \l__msg_text_str
(End of definition for \l__msg_name_str and \l__msg_text_str.)
```

### 52.1 Internal auxiliaries

```
\s__msg_mark Internal scan marks.
\s__msg_stop
9248 \scan_new:N \s__msg_mark
9249 \scan_new:N \s__msg_stop
(End of definition for \s__msg_mark and \s__msg_stop.)
\_msg_use_none_delimit_by_s_stop:w Functions to gobble up to a scan mark.
9250 \cs_new:Npn \_msg_use_none_delimit_by_s_stop:w #1 \s__msg_stop { }
(End of definition for \_msg_use_none_delimit_by_s_stop:w.)
```

### 52.2 Creating messages

Messages are created and used separately, so there two parts to the code here. First, a mechanism for creating message text. This is pretty simple, as there is not actually a lot to do.

```
\c__msg_text_prefix_tl Locations for the text of messages.
\c__msg_more_text_prefix_tl
9251 \tl_const:Nn \c__msg_text_prefix_tl { msg-text~>~ }
9252 \tl_const:Nn \c__msg_more_text_prefix_tl { msg-extra-text~>~ }
```

(End of definition for \c\_\_msg\_text\_prefix\_tl and \c\_\_msg\_more\_text\_prefix\_tl.)

**\msg\_if\_exist\_p:nn** Test whether the control sequence containing the message text exists or not.  
**\msg\_if\_exist:nnTF**

```

9253 \prg_new_conditional:Npnn \msg_if_exist:nn #1#2 { p , T , F , TF }
9254 {
9255     \cs_if_exist:cTF { \c__msg_text_prefix_tl #1 / #2 }
9256     { \prg_return_true: } { \prg_return_false: }
9257 }
```

(End of definition for \msg\_if\_exist:nnTF. This function is documented on page 84.)

**\\_\_msg\_chk\_if\_free:nn** This auxiliary is similar to \\_\_kernel\_chk\_if\_free\_cs:N, and is used when defining messages with \msg\_new:nnnn.

```

9258 \cs_new_protected:Npn \__msg_chk_free:nn #1#2
9259 {
9260     \msg_if_exist:nnT {#1} {#2}
9261     {
9262         \msg_error:nnnn { msg } { already-defined }
9263         {#1} {#2}
9264     }
9265 }
```

(End of definition for \\_\_msg\_chk\_if\_free:nn.)

**\msg\_new:nnnn** Setting a message simply means saving the appropriate text into two functions. A sanity check first.

**\msg\_new:nnee**  
**\msg\_new:nnxx**  
**\msg\_new:nnn**  
**\msg\_new:nne**  
**\msg\_new:nnx**  
**\msg\_set:nnnn**  
**\msg\_set:nnn**

```

9266 \cs_new_protected:Npn \msg_new:nnnn #1#2#3#4
9267 {
9268     \__msg_chk_free:nn {#1} {#2}
9269     \cs_gset:cpn { \c__msg_text_prefix_tl #1 / #2 }
9270     ##1##2##3##4 {#3}
9271     \cs_gset:cpn { \c__msg_more_text_prefix_tl #1 / #2 }
9272     ##1##2##3##4 {#4}
9273 }
9274 \cs_generate_variant:Nn \msg_new:nnnn { nnee , nnxx }
9275 \cs_new_protected:Npn \msg_new:nnn #1#2#3
9276 { \msg_new:nnnn {#1} {#2} {#3} { } }
9277 \cs_generate_variant:Nn \msg_new:nnn { nne , nnx }
9278 \cs_new_protected:Npn \msg_set:nnnn #1#2#3#4
9279 {
9280     \cs_set:cpn { \c__msg_text_prefix_tl #1 / #2 }
9281     ##1##2##3##4 {#3}
9282     \cs_set:cpn { \c__msg_more_text_prefix_tl #1 / #2 }
9283     ##1##2##3##4 {#4}
9284 }
9285 \cs_new_protected:Npn \msg_set:nnn #1#2#3
9286 { \msg_set:nnnn {#1} {#2} {#3} { } }
```

(End of definition for \msg\_new:nnnn and others. These functions are documented on page 84.)

## 52.3 Messages: support functions and text

```

\c__msg_coding_error_text_tl
\c__msg_continue_text_tl
\c__msg_critical_text_tl
\c__msg_fatal_text_tl

9309   Try~typing~<return>~to~proceed.
9310   \\
9311   If~that~doesn't~work,~type~X~<return>~to~quit.
9312 }
9313 \tl_const:Nn \c__msg_trouble_text_tl
9314 {
9315   \\ \\
9316   More~errors~will~almost~certainly~follow: \\
9317   the~LaTeX~run~should~be~aborted.
9318 }

```

*(End of definition for \c\_\_msg\_coding\_error\_text\_tl and others.)*

**\msg\_line\_number:** For writing the line number nicely. **\msg\_line\_context:** was set up earlier, so this is not new.

```

9319 \cs_new:Npn \msg_line_number: { \int_use:N \tex_inputlineno:D }
9320 \cs_gset:Npn \msg_line_context:
9321 {
9322   \c__msg_on_line_text_tl
9323   \c_space_tl
9324   \msg_line_number:
9325 }

```

*(End of definition for \msg\_line\_number: and \msg\_line\_context:. These functions are documented on page 85.)*

## 52.4 Showing messages: low level mechanism

`\_msg_interrupt:Nnnn`  
`\_msg_no_more_text:nnnn`

The low-level interruption macro is rather opaque, unfortunately. Depending on the availability of more information there is a choice of how to set up the further help. We feed the extra help text and the message itself to a wrapping auxiliary, in this order because we must first setup TeX's `\errhelp` register before issuing an `\errmessage`. To deal with the various cases of critical or fatal errors with and without help text, there is a bit of argument-passing to do.

```

9326 \cs_new_protected:Npn \_msg_interrupt:NnnnN #1#2#3#4#5
9327 {
9328   \str_set:Ne \l_msg_text_str { #1 {#2} }
9329   \str_set:Ne \l_msg_name_str { \msg_module_name:n {#2} }
9330   \cs_if_eq:cNTF
9331     { \c__msg_more_text_prefix_tl #2 / #3 }
9332     \_msg_no_more_text:nnnn
9333   {
9334     \_msg_interrupt_wrap:nnn
9335     { \use:c { \c__msg_text_prefix_tl #2 / #3 } #4 }
9336     { \c__msg_continue_text_tl }
9337     {
9338       \c__msg_no_info_text_tl
9339       \tl_if_empty:NF #5
9340       { \ \ \ #5 }
9341     }
9342   }
9343   {
9344     \_msg_interrupt_wrap:nnn
9345     { \use:c { \c__msg_text_prefix_tl #2 / #3 } #4 }
9346     { \c__msg_help_text_tl }
9347     {
9348       \use:c { \c__msg_more_text_prefix_tl #2 / #3 } #4
9349       \tl_if_empty:NF #5
9350       { \ \ \ #5 }
9351     }
9352   }
9353 }
9354 \cs_new:Npn \_msg_no_more_text:nnnn #1#2#3#4 { }
```

(End of definition for `\_msg_interrupt:Nnnn` and `\_msg_no_more_text:nnnn`.)

`\_msg_interrupt_wrap:nnn`  
`\_msg_interrupt_text:n`  
`\_msg_interrupt_more_text:n`

First setup TeX's `\errhelp` register with the extra help #1, then build a nice-looking error message with #2. Everything is done using e-type expansion as the new line markers are different for the two type of text and need to be correctly set up. The auxiliary `\_msg_interrupt_more_text:n` receives its argument as a line-wrapped string, which is thus unaffected by expansion. We have to split the main text into two parts as only the “message” itself is wrapped with a leader: the generic help is wrapped at full width. We also have to allow for the two characters used by `\errmessage` itself.

```

9355 \cs_new_protected:Npn \_msg_interrupt_wrap:nnn #1#2#3
9356 {
9357   \iow_wrap:nnnN { \ \ #3 } { } { } \_msg_interrupt_more_text:n
9358   \group_begin:
9359     \int_sub:Nn \l_iow_line_count_int { 2 }
9360     \iow_wrap:nenN { \l_msg_text_str : ~ #1 }
```

```

9361     {
9362       ( \l__msg_name_str )
9363       \prg_replicate:nn
9364       {
9365         \str_count:N \l__msg_text_str
9366         - \str_count:N \l__msg_name_str
9367         + 2
9368       }
9369       { ~ }
9370     }
9371     { } \__msg_interrupt_text:n
9372     \iow_wrap:nnnN { \l__msg_tmp_tl \\\ #2 } { } { }
9373     \__msg_interrupt:n
9374   }
9375   \cs_new_protected:Npn \__msg_interrupt_text:n #1
9376   {
9377     \group_end:
9378     \tl_set:Nn \l__msg_tmp_tl {#1}
9379   }
9380   \cs_new_protected:Npn \__msg_interrupt_more_text:n #1
9381   { \exp_args:Ne \tex_errhelp:D { #1 \iow_newline: } }

```

(End of definition for `\__msg_interrupt_wrap:nnn`, `\__msg_interrupt_text:n`, and `\__msg_interrupt_more_text:n`.)

`\__msg_interrupt:n` The business end of the process starts by producing some visual separation of the message from the main part of the log. The error message needs to be printed with everything made “invisible”:  $\text{\TeX}$ ’s own information involves the macro in which `\errmessage` is called, and the end of the argument of the `\errmessage`, including the closing brace. We use an active `!` to call the `\errmessage` primitive, and end its argument with `\use_none:n {<spaces>}` which fills the output with spaces. Two trailing closing braces are turned into spaces to hide them as well. The group in which we alter the definition of the active `!` is closed before producing the message: this ensures that tokens inserted by typing `I` in the command-line are inserted after the message is entirely cleaned up.

The `\__kernel_iow_with:Nnn` auxiliary, defined in `l3file`, expects an *<integer variable>*, an integer *<value>*, and some *<code>*. It runs the *<code>* after ensuring that the *<integer variable>* takes the given *<value>*, then restores the former value of the *<integer variable>* if needed. We use it to ensure that the `\newlinechar` is 10, as needed for `\iow_newline:` to work, and that `\errorcontextlines` is `-1`, to avoid showing irrelevant context. Note that restoring the former value of these integers requires inserting tokens after the `\errmessage`, which go in the way of tokens which could be inserted by the user. This is unavoidable.

```

9382 \group_begin:
9383   \char_set_lccode:nn { 38 } { 32 } % &
9384   \char_set_lccode:nn { 46 } { 32 } % .

(End of definition for \l\\_msg\\_class\\_loop\\_seq.)

\\_msg\\_use:nnnnnnn

\\_msg\\_use\\_redirect\\_name:n

\\_msg\\_use\\_hierarchy:nwWN

\\_msg\\_use\\_redirect\\_module:n

\\_msg\\_use\\_code:

Actually using a message is a multi-step process. First, some safety checks on the message and class requested. The code and arguments are then stored to avoid passing them around. The assignment to \\_msg\\_use\\_code: is similar to \tl\\_set:Nn. The message is eventually produced with whatever \l\\_msg\\_class\\_tl is when \\_msg\\_use\\_code: is called. Here is also a good place to suppress tracing output if the trace package is loaded since all (non-expandable) messages go through this auxiliary.

```

9638 \cs\_new\_protected:Npn \_msg\_use:nnnnnnn #1#2#3#4#5#6#7
9639 {
9640   \cs\_if\_exist\_use:N \conditionally@traceoff

9647       {
9648         \exp\_not:n
9649         {
9650           \use:c { \_msg\_ \l\_msg\_class\_tl \_code:nnnnnn }
9651           {#2} {#3} {#4} {#5} {#6} {#7}
9652         }
9653       }
9654       \_msg\_use\_redirect\_name:n { #2 / #3 }
9655     }
9656   }
9657   { \msg\_error:nnnn { msg } { unknown } {#2} {#3} }
9658   \cs\_if\_exist\_use:N \conditionally@traceon
9659 }
9660 \cs\_new\_protected:Npn \_msg\_use\_code: { }

```

The first check is for a individual message redirection. If this applies then no further redirection is attempted. Otherwise, split the message name into  $\langle module \rangle$ ,  $\langle submodule \rangle$  and  $\langle message \rangle$  (with an arbitrary number of slashes), and store  $\{/module/submodule\}$ ,  $\{/module\}$  and  $\{\}$  into  $\backslash l\_msg\_hierarchy\_seq$ . We then map through this sequence, applying the most specific redirection.

```

9676   \seq_put_left:Nn \l__msg_hierarchy_seq {#1}
9677   #4 { #1 / #2 } #3 \s__msg_mark #4
9678 }

```

At this point, the items of  $\backslash l\_msg\_hierarchy\_seq$  are the various levels at which we should look for a redirection. Redirections which are less specific than the argument of  $\backslash \_msg\_use\_redirect\_module:n$  are not attempted. This argument is empty for a class redirection,  $/module$  for a module redirection, etc. Loop through the sequence to find the most specific redirection, with module  $\##1$ . The loop is interrupted after testing for a redirection for  $\##1$  equal to the argument  $\#1$  (least specific redirection allowed). When a redirection is found, break the mapping, then if the redirection targets the same class, output the code with that class, and otherwise set the target as the new current class, and search for further redirections. Those redirections should be at least as specific as  $\##1$ .

```

9679 \cs_new_protected:Npn \__msg_use_redirect_module:n #1
9680 {
9681   \seq_map_inline:Nn \l__msg_hierarchy_seq
9682   {
9683     \prop_get:cnNTF { l__msg_redirect_ \l__msg_current_class_tl _prop }
9684     {##1} \l__msg_class_tl
9685     {
9686       \seq_map_break:n
9687       {
9688         \tl_if_eq:NNTF \l__msg_current_class_tl \l__msg_class_tl
9689         { \__msg_use_code: }
9690         {
9691           \tl_set_eq:NN \l__msg_current_class_tl \l__msg_class_tl
9692           \__msg_use_redirect_module:n {##1}
9693         }
9694       }
9695     }
9696   }
9697   \str_if_eq:nnT {##1} {#1}

```

```

9698         {
9699             \tl_set_eq:NN \l__msg_class_tl \l__msg_current_class_tl
9700             \seq_map_break:n { \__msg_use_code: }
9701         }
9702     }
9703 }
9704 }

```

(End of definition for \\_\_msg\_use:nnnnnnn and others.)

**\msg\_redirect\_name:nnn** Named message always use the given class even if that class is redirected further. An empty target class cancels any existing redirection for that message.

```

9705 \cs_new_protected:Npn \msg_redirect_name:nnn #1#2#3
9706 {
9707     \tl_if_empty:nTF {#3}
9708     { \prop_remove:Nn \l__msg_redirect_prop { / #1 / #2 } }
9709     {
9710         \__msg_class_chk_exist:nT {#3}
9711         { \prop_put:Nnn \l__msg_redirect_prop { / #1 / #2 } {#3} }
9712     }
9713 }

```

(End of definition for \msg\_redirect\_name:nnn. This function is documented on page 92.)

**\msg\_redirect\_class:nn** If the target class is empty, eliminate the corresponding redirection. Otherwise, add the redirection. We must then check for a loop: as an initialization, we start by storing the initial class in \l\_\_msg\_current\_class\_tl.

**\msg\_redirect\_module:nnn**  
**\\_\_msg\_redirect:nnn**  
**\\_\_msg\_redirect\_loop\_chk:nnn**  
**\\_\_msg\_redirect\_loop\_list:n**

```

9714 \cs_new_protected:Npn \msg_redirect_class:nn
9715 { \__msg_redirect:nnn { } }
9716 \cs_new_protected:Npn \msg_redirect_module:nnn #1
9717 { \__msg_redirect:nnn { / #1 } }
9718 \cs_new_protected:Npn \__msg_redirect:nnn #1#2#3
9719 {

9724         {
9725             \__msg_class_chk_exist:nT {#3}
9726             {
9727                 \prop_put:cnn { l__msg_redirect_ #2 _prop } {#1} {#3}
9728                 \tl_set:Nn \l__msg_current_class_tl {#2}
9729                 \seq_clear:N \l__msg_class_loop_seq
9730                 \__msg_redirect_loop_chk:nnn {#2} {#3} {#1}
9731             }
9732         }
9733     }
9734 }

```

Since multiple redirections can only happen with increasing specificity, a loop requires that all steps are of the same specificity. The new redirection can thus only create a loop with other redirections for the exact same module, #1, and not submodules. After some initialization above, follow redirections with \l\_\_msg\_class\_tl, and keep track in \l\_\_msg\_class\_loop\_seq of the various classes encountered. A redirection from a class to

itself, or the absence of redirection both mean that there is no loop. A redirection to the initial class marks a loop. To break it, we must decide which redirection to cancel. The user most likely wants the newly added redirection to hold with no further redirection. We thus remove the redirection starting from #2, target of the new redirection. Note that no message is emitted by any of the underlying functions: otherwise we may get an infinite loop because of a message from the message system itself.

```

## 52.6 Kernel-specific functions

`\__kernel_msg_show_eval:Nn` A short-hand used for `\int_show:n` and similar functions that passes to `\tl_show:n` the result of applying #1 (a function such as `\int_eval:n`) to the expression #2. The use of f-expansion ensures that #1 is expanded in the scope in which the show command is called, rather than in the group created by `\iow_wrap:nnnN`. This is only important for expressions involving the `\currentgrouplevel` or `\currentgrouptype`. On the other hand we want the expression to be converted to a string with the usual escape character, hence within the wrapping code.

```

9762 \cs_new_protected:Npn \__kernel_msg_show_eval:Nn #1#2
9763 { \exp_args:Nf \__msg_show_eval:nnN { #1 {#2} } {#2} \tl_show:n }
9764 \cs_new_protected:Npn \__kernel_msg_log_eval:Nn #1#2
9765 { \exp_args:Nf \__msg_show_eval:nnN { #1 {#2} } {#2} \tl_log:n }
9766 \cs_new_protected:Npn \__msg_show_eval:nnN #1#2#3 { #3 { #2 = #1 } }

```

(End of definition for `\_kernel_msg_show_eval:Nn`, `\_kernel_msg_log_eval:Nn`, and `\_msg_show_eval:nnN`.)

These are all retained purely for older xparse support.

10146 }

```

## 52.8 Expandable errors

`\__msg_expandable_error:nn` In expansion only context, we cannot use the normal means of reporting errors. Instead, we rely on a low-level  $\text{\TeX}$  error caused by expanding a macro `\???`  with parameter text “?” (this could be any token) which we used followed by something else (here, a space). This shows the context, which thanks to the odd-looking `\use:n` is

```

<argument> \???
! mypkg Error: The error message.

```

In other words,  $\text{\TeX}$  is processing the argument of `\use:n`, which is `\??? <space> ! <error type> : <error message>`.

```

10147 \cs_set_protected:Npn \__msg_tmp:w #1
10148 {
10149   \cs_new:Npn #1 ? { }
10150   \cs_new:Npn \__msg_expandable_error:nn ##1##2
10151   {
10152     \exp_after:wN \exp_after:wN
10153     \exp_after:wN \__msg_use_none_delimit_by_s_stop:w
10154     \use:n { #1 ~ ! ~ ##2 : ~ ##1 } \s__msg_stop
10155   }
10156 }
10157 \exp_args:Nc \__msg_tmp:w { ??? }

```

(End of definition for `\_msg_expandable_error:nn`.)

`\msg_expandable_error:nnnnnn` The command built from the csname `\c\_msg_text_prefix_tl #1 / #2` takes four arguments and builds the error text, which is fed to `\_msg_expandable_error:n` with appropriate expansion: just as for usual messages the arguments are first turned to strings, then the message is fully expanded. The module name also has to be determined.

```

10158 \exp_args_generate:n { oooo }
10159 \cs_new:Npn \msg_expandable_error:nnnnnn #1#2#3#4#5#6
10160 {

## Chapter 53

# l3file implementation

*The following test files are used for this code: m3file001.*

```
10200 <{*code>
```

### 53.1 Input operations

```
10201 <@@=ior>
```

#### 53.1.1 Variables and constants

`\l__ior_tmp_tl` Used as a short-term scratch variable.

```
10202 \tl_new:N \l__ior_tmp_tl
```

*(End of definition for \l\_\_ior\_tmp\_tl.)*

`\c__ior_term_ior` Reading from the terminal (with a prompt) is done using a positive but non-existent stream number. Unlike writing, there is no concept of reading from the log.

```
10203 \int_const:Nn \c__ior_term_ior { 16 }
```

*(End of definition for \c\_\_ior\_term\_ior.)*

`\g__ior_streams_seq` A list of the currently-available input streams to be used as a stack.

```
10204 \seq_new:N \g__ior_streams_seq
```

*(End of definition for \g\_\_ior\_streams\_seq.)*

`\l__ior_stream_tl` Used to recover the raw stream number from the stack.

```
10205 \tl_new:N \l__ior_stream_tl
```

*(End of definition for \l\_\_ior\_stream\_tl.)*

`\g__ior_streams_prop` The name of the file attached to each stream is tracked in a property list. To get the correct number of reserved streams in package mode the underlying mechanism needs to be queried. For L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and plain T<sub>E</sub>X this data is stored in `\count16`; with the `etex` package loaded we need to subtract 1 as the register holds the number of the next stream to use. In ConT<sub>E</sub>Xt, we need to look at `\count38` but there is no subtraction: like the original plain T<sub>E</sub>X/L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> mechanism it holds the value of the *last* stream allocated.

```
10206 \prop_new:N \g__ior_streams_prop
```

```

10207 \int_step_inline:nnn
10208 { 0 }
10209 {
10210   \cs_if_exist:NTF \contextversion
10211   { \tex_count:D 38 ~ }
10212   {
10213     \tex_count:D 16 ~ %
10214     \cs_if_exist:NT \loccount { - 1 }
10215   }
10216 }
10217 {
10218   \prop_gput:Nnn \g__ior_streams_prop {#1} { Reserved-by~format }
10219 }

```

(End of definition for \g\_\_ior\_streams\_prop.)

### 53.1.2 Stream management

**\ior\_new:N** Reserving a new stream is done by defining the name as equal to using the terminal.

```

\ior_new:c 10220 \cs_new_protected:Npn \ior_new:N #1 { \cs_new_eq:NN #1 \c__ior_term_ior }
10221 \cs_generate_variant:Nn \ior_new:N { c }

```

(End of definition for \ior\_new:N. This function is documented on page 94.)

**\g\_tmpa\_ior** The usual scratch space.

```

\g_tmpb_ior 10222 \ior_new:N \g_tmpa_ior
10223 \ior_new:N \g_tmpb_ior

```

(End of definition for \g\_tmpa\_ior and \g\_tmpb\_ior. These variables are documented on page 102.)

**\ior\_open:Nn** Use the conditional version, with an error if the file is not found.

```

\ior_open:cn 10224 \cs_new_protected:Npn \ior_open:Nn #1#2
10225 { \ior_open:NnF #1 {#2} { \__kernel_file_missing:n {#2} } }
10226 \cs_generate_variant:Nn \ior_open:Nn { c }

```

(End of definition for \ior\_open:Nn. This function is documented on page 94.)

**\l\_\_ior\_file\_name\_tl** Data storage.

```

10227 \tl_new:N \l__ior_file_name_tl

```

(End of definition for \l\_\_ior\_file\_name\_tl.)

**\ior\_open:NnTF** An auxiliary searches for the file in the T<sub>E</sub>X, L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and L<sup>A</sup>T<sub>E</sub>X 3 paths. Then pass the file found to the lower-level function which deals with streams. The full\_name is empty when the file is not found.

```

\ior_open:cnTF 10228 \prg_new_protected_conditional:Npnn \ior_open:Nn #1#2 { T , F , TF }
10229 {
10230   \file_get_full_name:nNTF {#2} \l__ior_file_name_tl
10231   {
10232     \__kernel_ior_open:No #1 \l__ior_file_name_tl
10233     \prg_return_true:
10234   }
10235   { \prg_return_false: }
10236 }
10237 \prg_generate_conditional_variant:Nnn \ior_open:Nn { c } { T , F , TF }

```

(End of definition for `\ior_open:NnTF`. This function is documented on page 94.)

`\__ior_new:N` Streams are reserved using `\newread` before they can be managed by `ior`. To prevent `ior` from being affected by redefinitions of `\newread` (such as done by the third-party package `morewrites`), this macro is saved here under a private name. The complicated code ensures that `\__ior_new:N` is not `\outer` despite plain TeX's `\newread` being `\outer`. For ConTeXt, we have to deal with the fact that `\newread` works like our own: it actually checks before altering definition.

```

10238 \exp_args:NNf \cs_new_protected:Npn \__ior_new:N
10239   { \exp_args:NNc \exp_after:wN \exp_stop_f: { newread } }
10240 \cs_if_exist:NT \contextversion
10241   {
10242     \cs_new_eq:NN \__ior_new_aux:N \__ior_new:N
10243     \cs_gset_protected:Npn \__ior_new:N #1
10244       {
10245         \cs_undefine:N #1
10246         \__ior_new_aux:N #1
10247       }
10248   }

```

(End of definition for `\__ior_new:N`.)

`\__kernel_ior_open:Nn` The stream allocation itself uses the fact that there is a list of all of those available. Life gets more complex as it's important to keep things in sync. That is done using a two-part approach: any streams that have already been taken up by `ior` but are now free are tracked, so we first try those. If that fails, ask plain TeX or L<sup>A</sup>T<sub>Ε</sub>X 2<sub>ε</sub> for a new stream and use that number (after a bit of conversion).

`\__kernel_ior_open:No`

`\__ior_open_stream:Nn`

```

10249 \cs_new_protected:Npn \__kernel_ior_open:Nn #1#2
10250   {
10251     \ior_close:N #1
10252     \seq_gpop:NNTF \g__ior_streams_seq \l__ior_stream_tl
10253     { \__ior_open_stream:Nn #1 {#2} }
10254     {
10255       \__ior_new:N #1
10256       \__kernel_tl_set:Nx \l__ior_stream_tl { \int_eval:n {#1} }
10257       \__ior_open_stream:Nn #1 {#2}
10258     }
10259   }
10260 \cs_generate_variant:Nn \__kernel_ior_open:Nn { No }

```

Here, we act defensively in case LuaTeX is in use with an extensionless file name.

```

10261 \cs_new_protected:Npe \__ior_open_stream:Nn #1#2
10262   {
10263     \tex_global:D \tex_chardef:D #1 = \exp_not:N \l__ior_stream_tl \scan_stop:
10264     \prop_gput:NVn \exp_not:N \g__ior_streams_prop #1 {#2}
10265     \tex_openin:D #1
10266     \sys_if_engine luatex:TF
10267       { {#2} }
10268       { \exp_not:N \__kernel_file_name_quote:n {#2} \scan_stop: }
10269   }

```

(End of definition for `\__kernel_ior_open:Nn` and `\__ior_open_stream:Nn`.)

`\ior_shell_open:Nn` Actually much easier than either the standard `open` or `input` versions! When calling `\__ior_shell_open:nN` the file the pipe is added to signal a shell command, but the quotes are not added yet—they are added later by `\__kernel_file_name_quote:n`.

```

10270 \cs_new_protected:Npn \ior_shell_open:Nn #1#2
10271 {
10272   \sys_if_shell:TF
10273     { \__ior_shell_open:oN { \tl_to_str:n {#2} } #1 }
10274     { \msg_error:nn { kernel } { pipe-failed } }
10275 }
10276 \cs_new_protected:Npn \__ior_shell_open:nN #1#2
10277 {
10278   \tl_if_in:nnTF {#1} { " }
10279   {
10280     \msg_error:nne
10281       { kernel } { quote-in-shell } {#1}
10282   }
10283   { \__kernel_ior_open:Nn #2 { |#1 } }
10284 }
10285 \cs_generate_variant:Nn \__ior_shell_open:nN { o }
10286 \msg_new:nnnn { kernel } { pipe-failed }
10287 { Cannot~run~piped~system~commands. }
10288 {
10289   LaTeX~tried~to~call~a~system~process~but~this~was~not~possible.\\
10290   Try~the~"--shell-escape"~(or~"--enable-pipes")~option.
10291 }

```

(End of definition for `\ior_shell_open:Nn` and `\__ior_shell_open:nN`. This function is documented on page 94.)

`\ior_close:N` Closing a stream means getting rid of it at the T<sub>E</sub>X level and removing from the various data structures. Unless the name passed is an invalid stream number (outside the range [0, 15]), it can be closed. On the other hand, it only gets added to the stack if it was not already there, to avoid duplicates building up.

`\ior_close:c`

```

10292 \cs_new_protected:Npn \ior_close:N #1
10293 {
10294   \int_compare:nT { -1 < #1 < \c__ior_term_ior }
10295   {
10296     \tex_closein:D #1
10297     \prop_gremove:NV \g__ior_streams_prop #1
10298     \seq_if_in:NVF \g__ior_streams_seq #1
10299     { \seq_gpush:NV \g__ior_streams_seq #1 }
10300     \cs_gset_eq:NN #1 \c__ior_term_ior
10301   }
10302 }
10303 \cs_generate_variant:Nn \ior_close:N { c }

```

(End of definition for `\ior_close:N`. This function is documented on page 95.)

`\ior_show:N` Seek the stream in the `\g__ior_streams_prop` list, then show the stream as open or closed accordingly.

`\ior_log:N`

`\__ior_show:NN`

```

10304 \cs_new_protected:Npn \ior_show:N { \__ior_show:NN \tl_show:n }
10305 \cs_generate_variant:Nn \ior_show:N { c }
10306 \cs_new_protected:Npn \ior_log:N { \__ior_show:NN \tl_log:n }
10307 \cs_generate_variant:Nn \ior_log:N { c }

```

```

10308 \cs_new_protected:Npn \__ior_show:NN #1#2
10309 {
10310     \__kernel_chk_defined:NT #2
10311     {
10312         \prop_get:NVNTF \g__ior_streams_prop #2 \l__ior_tmp_tl
10313         {
10314             \exp_args:Ne #1
10315             { \token_to_str:N #2 ~ open: ~ \l__ior_tmp_tl }
10316         }
10317         { \exp_args:Ne #1 { \token_to_str:N #2 ~ closed } }
10318     }
10319 }

```

(End of definition for `\ior_show:N`, `\ior_log:N`, and `\__ior_show:NN`. These functions are documented on page 95.)

**`\ior_show_list:`** Show the property lists, but with some “pretty printing”. See the `l3msg` module. The first argument of the message is `ior` (as opposed to `iow`) and the second is empty if no read stream is open and non-empty (the list of streams formatted using `\msg_show_item_unbraced:nn`) otherwise. The code of the message `show-streams` takes care of translating `ior/iow` to English.

**`\ior_log_list:`**

**`\__ior_list:N`**

```

10320 \cs_new_protected:Npn \ior_show_list: { \__ior_list:N \msg_show:nneeee }
10321 \cs_new_protected:Npn \ior_log_list: { \__ior_list:N \msg_log:nneeee }
10322 \cs_new_protected:Npn \__ior_list:N #1
10323 {
10324     #1 { kernel } { show-streams }
10325     { ior }
10326     {
10327         \prop_map_function:NN \g__ior_streams_prop
10328         \msg_show_item_unbraced:nn
10329     }
10330     { } { }
10331 }

```

(End of definition for `\ior_show_list:`, `\ior_log_list:`, and `\__ior_list:N`. These functions are documented on page 95.)

### 53.1.3 Reading input

**`\if_eof:w`** The primitive conditional

```

10332 \cs_new_eq:NN \if_eof:w \tex_ifeof:D

```

(End of definition for `\if_eof:w`. This function is documented on page 102.)

**`\ior_if_eof_p:N`** To test if some particular input stream is exhausted the following conditional is provided.

**`\ior_if_eof:NTF`** The primitive test can only deal with numbers in the range `[0,15]` so we catch outliers (they are exhausted).

```

10333 \prg_new_conditional:Npnn \ior_if_eof:N #1 { p , T , F , TF }
10334 {
10335     \if_int_compare:w -1 < #1
10336     \if_int_compare:w #1 < \c__ior_term_ior
10337     \if_eof:w #1
10338         \prg_return_true:
10339     \else:

```

```

10340         \prg_return_false:
10341     \fi:
10342 \else:
10343     \prg_return_true:
10344 \fi:
10345 \else:
10346     \prg_return_true:
10347 \fi:
10348 }

```

(End of definition for `\ior_if_eof:NTF`. This function is documented on page 98.)

`\ior_get:NN` And here we read from files.

```

\__ior_get:NN 10349 \cs_new_protected:Npn \ior_get:NN #1#2
\ior_get:NNTF 10350 { \ior_get:NNTF #1 #2 { \tl_set:Nn #2 { \q_no_value } } }
10351 \cs_new_protected:Npn \__ior_get:NN #1#2
10352 { \tex_read:D #1 to #2 }
10353 \prg_new_protected_conditional:Npnn \ior_get:NN #1#2 { T , F , TF }
10354 {
10355     \ior_if_eof:NTF #1
10356     { \prg_return_false: }
10357     {
10358         \__ior_get:NN #1 #2
10359         \prg_return_true:
10360     }
10361 }

```

(End of definition for `\ior_get:NN`, `\__ior_get:NN`, and `\ior_get:NNTF`. These functions are documented on page 96.)

`\ior_str_get:NN` Reading as strings is a more complicated wrapper, as we wish to remove the endline  
`\__ior_str_get:NN` character and restore it afterwards.

```

\ior_str_get:NNTF 10362 \cs_new_protected:Npn \ior_str_get:NN #1#2
10363 { \ior_str_get:NNTF #1 #2 { \tl_set:Nn #2 { \q_no_value } } }
10364 \cs_new_protected:Npn \__ior_str_get:NN #1#2
10365 {
10366     \exp_args:Nno \use:n
10367     {
10368         \int_set:Nn \tex_endlinechar:D { -1 }
10369         \tex_readline:D #1 to #2
10370         \int_set:Nn \tex_endlinechar:D
10371         } { \int_use:N \tex_endlinechar:D }
10372     }
10373 \prg_new_protected_conditional:Npnn \ior_str_get:NN #1#2 { T , F , TF }
10374 {
10375     \ior_if_eof:NTF #1
10376     { \prg_return_false: }
10377     {
10378         \__ior_str_get:NN #1 #2
10379         \prg_return_true:
10380     }
10381 }

```

(End of definition for `\ior_str_get:NN`, `\__ior_str_get:NN`, and `\ior_str_get:NNTF`. These functions are documented on page 96.)

`\c__ior_term_noprompt_ior` For reading without a prompt.

```
10382 \int_const:Nn \c__ior_term_noprompt_ior { -1 }
```

(End of definition for `\c__ior_term_noprompt_ior`.)

`\ior_get_term:nN` Getting from the terminal is better with pretty-printing.

`\ior_str_get_term:nN`  
`\__ior_get_term:NnN`

```
10383 \cs_new_protected:Npn \ior_get_term:nN #1#2
10384 { \__ior_get_term:NnN \__ior_get:NN {#1} #2 }
10385 \cs_new_protected:Npn \ior_str_get_term:nN #1#2
10386 { \__ior_get_term:NnN \__ior_str_get:NN {#1} #2 }
10387 \cs_new_protected:Npn \__ior_get_term:NnN #1#2#3
10388 {
10389   \group_begin:
10390     \tex_escapechar:D = -1 \scan_stop:
10391     \tl_if_blank:nTF {#2}
10392       { \exp_args:NNc #1 \c__ior_term_noprompt_ior }
10393       { \exp_args:NNc #1 \c__ior_term_ior }
10394     {#2}
10395   \exp_args:NNNv \group_end:
10396   \tl_set:Nn #3 {#2}
10397 }
```

(End of definition for `\ior_get_term:nN`, `\ior_str_get_term:nN`, and `\__ior_get_term:NnN`. These functions are documented on page 99.)

`\ior_map_break:` Usual map breaking functions.

`\ior_map_break:n`

```
10398 \cs_new:Npn \ior_map_break:
10399 { \prg_map_break:Nn \ior_map_break: { } }
10400 \cs_new:Npn \ior_map_break:n
10401 { \prg_map_break:Nn \ior_map_break: }
```

(End of definition for `\ior_map_break:` and `\ior_map_break:n`. These functions are documented on page 98.)

`\ior_map_inline:Nn`

`\ior_str_map_inline:Nn`

`\__ior_map_inline:NNn`

`\__ior_map_inline:NNNn`

`\__ior_map_inline_loop:NNN`

Mapping over an input stream can be done on either a token or a string basis, hence the set up. Within that, there is a check to avoid reading past the end of a file, hence the two applications of `\ior_if_eof:N` and its lower-level analogue `\if_eof:w`. This mapping cannot be nested with twice the same stream, as the stream has only one “current line”.

```
10402 \cs_new_protected:Npn \ior_map_inline:Nn
10403 { \__ior_map_inline:NNn \__ior_get:NN }
10404 \cs_new_protected:Npn \ior_str_map_inline:Nn
10405 { \__ior_map_inline:NNn \__ior_str_get:NN }
10406 \cs_new_protected:Npn \__ior_map_inline:NNn
10407 {
10408   \int_gincr:N \g__kernel_prg_map_int
10409   \exp_args:Nc \__ior_map_inline:NNNn
10410     { \__ior_map_ \int_use:N \g__kernel_prg_map_int :n }
10411 }
10412 \cs_new_protected:Npn \__ior_map_inline:NNNn #1#2#3#4
10413 {
10414   \cs_gset_protected:Npn #1 ##1 {#4}
10415   \ior_if_eof:NF #3 { \__ior_map_inline_loop:NNN #1#2#3 }
10416   \prg_break_point:Nn \ior_map_break:
10417     { \int_gdecr:N \g__kernel_prg_map_int }
```

```

10418 }
10419 \cs_new_protected:Npn \__ior_map_inline_loop:NNN #1#2#3
10420 {
10421     #2 #3 \l__ior_tmp_tl
10422     \if_eof:w #3
10423         \exp_after:wN \ior_map_break:
10424     \fi:
10425     \exp_args:No #1 \l__ior_tmp_tl
10426     \__ior_map_inline_loop:NNN #1#2#3
10427 }

```

(End of definition for `\ior_map_inline:Nn` and others. These functions are documented on page 97.)

```

\ior_map_variable:NNn
\ior_str_map_variable:NNn
\__ior_map_variable:NNNn
  \__ior_map_variable_loop:NNNn

```

Since the TeX primitive (`\read` or `\readline`) assigns the tokens read in the same way as a token list assignment, we simply call the appropriate primitive. The end-of-loop is checked using the primitive conditional for speed.

```

10428 \cs_new_protected:Npn \ior_map_variable:NNn
10429     { \__ior_map_variable:NNNn \ior_get:NN }
10430 \cs_new_protected:Npn \ior_str_map_variable:NNn
10431     { \__ior_map_variable:NNNn \ior_str_get:NN }
10432 \cs_new_protected:Npn \__ior_map_variable:NNNn #1#2#3#4
10433     {
10434         \ior_if_eof:NF #2 { \__ior_map_variable_loop:NNNn #1#2#3 {#4} }
10435         \prg_break_point:Nn \ior_map_break: { }
10436     }
10437 \cs_new_protected:Npn \__ior_map_variable_loop:NNNn #1#2#3#4
10438     {
10439         #1 #2 #3
10440         \if_eof:w #2
10441             \exp_after:wN \ior_map_break:
10442         \fi:
10443         #4
10444         \__ior_map_variable_loop:NNNn #1#2#3 {#4}
10445     }

```

(End of definition for `\ior_map_variable:NNn` and others. These functions are documented on page 97.)

## 53.2 Output operations

```

10446 <@@=iow>

```

There is a lot of similarity here to the input operations, at least for many of the basics. Thus quite a bit is copied from the earlier material with minor alterations.

### 53.2.1 Variables and constants

`\l__iow_tmp_tl` Used as a short-term scratch variable.

```

10447 \tl_new:N \l__iow_tmp_tl

```

(End of definition for `\l__iow_tmp_tl`.)

`\c_log_iow` Here we allocate two output streams for writing to the transcript file only (`\c_log_iow`)  
`\c_term_iow` and to both the terminal and transcript file (`\c_term_iow`). Recent LuaTeX provide 128

write streams; we also use `\c_term_iow` as the first non-allowed write stream so its value depends on the engine.

```

10448 \int_const:Nn \c_log_iow { -1 }
10449 \int_const:Nn \c_term_iow
10450 {
10451   \bool_lazy_and:nnTF
10452     { \sys_if_engine luatex_p: }
10453     { \int_compare_p:nNn \tex_luatexversion:D > { 80 } }
10454     { 128 }
10455     { 16 }
10456 }

```

*(End of definition for `\c_log_iow` and `\c_term_iow`. These variables are documented on page 102.)*

`\g__iow_streams_seq` A list of the currently-available output streams to be used as a stack.

```

10457 \seq_new:N \g__iow_streams_seq

```

*(End of definition for `\g__iow_streams_seq`.)*

`\l__iow_stream_tl` Used to recover the raw stream number from the stack.

```

10458 \tl_new:N \l__iow_stream_tl

```

*(End of definition for `\l__iow_stream_tl`.)*

`\g__iow_streams_prop` As for reads with the appropriate adjustment of the register numbers to check on.

```

10459 \prop_new:N \g__iow_streams_prop
10460 \int_step_inline:nnn
10461 { 0 }
10462 {
10463   \cs_if_exist:NTF \contextversion
10464     { \tex_count:D 39 ~ }
10465     {
10466       \tex_count:D 17 ~
10467       \cs_if_exist:NT \loccount { - 1 }
10468     }
10469 }
10470 {
10471   \prop_gput:Nnn \g__iow_streams_prop {#1} { Reserved-by~format }
10472 }

```

*(End of definition for `\g__iow_streams_prop`.)*

## 53.2.2 Internal auxiliaries

`\s__iow_mark` Internal scan marks.

```

\s__iow_stop 10473 \scan_new:N \s__iow_mark
10474 \scan_new:N \s__iow_stop

```

*(End of definition for `\s__iow_mark` and `\s__iow_stop`.)*

`\__iow_use_i_delimit_by_s_stop:nw` Functions to gobble up to a scan mark.

```

10475 \cs_new:Npn \__iow_use_i_delimit_by_s_stop:nw #1 #2 \s__iow_stop {#1}

```

*(End of definition for `\__iow_use_i_delimit_by_s_stop:nw`.)*

`\q__iow_nil` Internal quarks.  
10476 `\quark_new:N \q__iow_nil`  
*(End of definition for \q\_\_iow\_nil.)*

### 53.3 Stream management

`\iow_new:N` Reserving a new stream is done by defining the name as equal to writing to the terminal:  
`\iow_new:c` odd but at least consistent.

10477 `\cs_new_protected:Npn \iow_new:N #1 { \cs_new_eq:NN #1 \c_term_iow }`  
10478 `\cs_generate_variant:Nn \iow_new:N { c }`

*(End of definition for \iow\_new:N. This function is documented on page 94.)*

`\g_tmpa_iow` The usual scratch space.  
`\g_tmpb_iow`  
10479 `\iow_new:N \g_tmpa_iow`  
10480 `\iow_new:N \g_tmpb_iow`

*(End of definition for \g\_tmpa\_iow and \g\_tmpb\_iow. These variables are documented on page 102.)*

`\__iow_new:N` As for read streams, copy `\newwrite`, making sure that it is not `\outer`. For ConTeXt, we have to deal with the fact that `\newwrite` works like our own: it actually checks before altering definition.

10481 `\exp_args:Nnf \cs_new_protected:Npn \__iow_new:N`  
10482 `{ \exp_args:Nnc \exp_after:wN \exp_stop_f: { newwrite } }`  
10483 `\cs_if_exist:NT \contextversion`  
10484 `{`  
10485 `\cs_new_eq:NN \__iow_new_aux:N \__iow_new:N`  
10486 `\cs_gset_protected:Npn \__iow_new:N #1`  
10487 `{`  
10488 `\cs_undefine:N #1`  
10489 `\__iow_new_aux:N #1`  
10490 `}`  
10491 `}`

*(End of definition for \\_\_iow\_new:N.)*

`\l__iow_file_name_tl` Data storage.

10492 `\tl_new:N \l__iow_file_name_tl`

*(End of definition for \l\_\_iow\_file\_name\_tl.)*

`\iow_open:Nn` The same idea as for reading, but without the path and without the need to allow for a conditional version.

`\iow_open:NV`  
`\iow_open:cn` 10493 `\cs_new_protected:Npn \iow_open:Nn #1#2`  
`\iow_open:cV` 10494 `{`

`\__kernel_iow_open:Nn` 10495 `\__kernel_tl_set:Nx \l__iow_file_name_tl`  
`\__kernel_iow_open:No` 10496 `{ \__kernel_file_name_sanitize:n {#2} }`  
`\__iow_open_stream:Nn` 10497 `\__kernel_iow_open:No #1 \l__iow_file_name_tl`  
`\__iow_open_stream:NV` 10498 `}`  
10499 `\cs_generate_variant:Nn \iow_open:Nn { NV , c , cV }`  
10500 `\cs_new_protected:Npn \__kernel_iow_open:Nn #1#2`  
10501 `{`

```

10502 \iow_close:N #1
10503 \seq_gpop:NNTF \g__iow_streams_seq \l__iow_stream_tl
10504 { \__iow_open_stream:Nn #1 {#2} }
10505 {
10506   \__iow_new:N #1
10507   \__kernel_tl_set:Nx \l__iow_stream_tl { \int_eval:n {#1} }
10508   \__iow_open_stream:Nn #1 {#2}
10509 }
10510 }
10511 \cs_generate_variant:Nn \__kernel_iow_open:Nn { No }
10512 \cs_new_protected:Npn \__iow_open_stream:Nn #1#2
10513 {
10514   \tex_global:D \tex_chardef:D #1 = \l__iow_stream_tl \scan_stop:
10515   \prop_gput:Nvn \g__iow_streams_prop #1 {#2}
10516   \tex_immediate:D \tex_openout:D
10517     #1 \__kernel_file_name_quote:n {#2} \scan_stop:
10518 }
10519 \cs_generate_variant:Nn \__iow_open_stream:Nn { NV }

```

(End of definition for `\iow_open:Nn`, `\__kernel_iow_open:Nn`, and `\__iow_open_stream:Nn`. This function is documented on page 94.)

`\iow_shell_open:Nn`  
`\__iow_shell_open:nN`  
`\__iow_shell_open:oN`

Very similar to the `ior` version

```

10520 \cs_new_protected:Npn \iow_shell_open:Nn #1#2
10521 {
10522   \sys_if_shell:TF
10523     { \__iow_shell_open:oN { \tl_to_str:n {#2} } #1 }
10524     { \msg_error:nn { kernel } { pipe-failed } }

10575   }

```

(End of definition for `\iow_show_list:`, `\iow_log_list:`, and `\__iow_list:N`. These functions are documented on page 95.)

### 53.3.1 Deferred writing

```

\iow_shipout_e:Nn First the easy part, this is the primitive, which expects its argument to be braced.
\iow_shipout_e:Ne
\iow_shipout_e:cn
\iow_shipout_e:ce
10576   \cs_new_protected:Npn \iow_shipout_e:Nn #1#2
10577   { \tex_write:D #1 {#2} }
10578   \cs_generate_variant:Nn \iow_shipout_e:Nn { Ne , c, ce }

```

(End of definition for `\iow_shipout_e:Nn`. This function is documented on page 100.)

`\iow_shipout:Nn` With  $\varepsilon$ -TeX available deferred writing without expansion is easy.

```

\iow_shipout:Ne 10579 \cs_new_protected:Npn \iow_shipout:Nn #1#2
\iow_shipout:Nx 10580 { \tex_write:D #1 { \exp_not:n {#2} } }
\iow_shipout:cn 10581 \cs_generate_variant:Nn \iow_shipout:Nn { Ne , c , ce }
\iow_shipout:ce 10582 \cs_generate_variant:Nn \iow_shipout:Nn { Nx , cx }
\iow_shipout:cx

```

*(End of definition for \iow\_shipout:Nn. This function is documented on page 99.)*

### 53.3.2 Immediate writing

`\__kernel_iow_with:Nnn` If the integer #1 is equal to #2, just leave #3 in the input stream. Otherwise, pass the old value to an auxiliary, which sets the integer to the new value, runs the code, and restores the integer.

```

10583 \cs_new_protected:Npn \__kernel_iow_with:Nnn #1#2
10584 {
10585   \int_compare:nNnTF {#1} = {#2}
10586   { \use:n }
10587   { \__iow_with:oNnn { \int_use:N #1 } #1 {#2} }
10588 }
10589 \cs_new_protected:Npn \__iow_with:nNnn #1#2#3#4
10590 {
10591   \int_set:Nn #2 {#3}
10592   #4
10593   \int_set:Nn #2 {#1}
10594 }
10595 \cs_generate_variant:Nn \__iow_with:nNnn { o }

```

*(End of definition for \\_\_kernel\_iow\_with:Nnn and \\_\_iow\_with:nNnn.)*

`\iow_now:Nn` This routine writes the second argument onto the output stream without expansion. If this stream isn't open, the output goes to the terminal instead. If the first argument is no output stream at all, we get an internal error. We don't use the expansion done by `\write` to get the `Nx` variant, because it differs in subtle ways from `x`-expansion, namely, macro parameter characters would not need to be doubled. We set the `\newlinechar` to 10 using `\__kernel_iow_with:Nnn` to support formats such as plain TeX: otherwise, `\iow_newline:` would not work. We do not do this for `\iow_shipout:Nn` or `\iow_shipout_x:Nn`, as TeX looks at the value of the `\newlinechar` at shipout time in those cases.

```

10596 \cs_new_protected:Npn \iow_now:Nn #1#2
10597 {
10598   \__kernel_iow_with:Nnn \tex_newlinechar:D { '\^^J }
10599   { \tex_immediate:D \tex_write:D #1 { \exp_not:n {#2} } }
10600 }
10601 \cs_generate_variant:Nn \iow_now:Nn { NV , Ne , c , cV , ce }
10602 \cs_generate_variant:Nn \iow_now:Nn { Nx , cx }

```

*(End of definition for \iow\_now:Nn. This function is documented on page 99.)*

`\iow_log:n` Writing to the log and the terminal directly are relatively easy; as we need the two e-type variants for bootstrapping, they are redefinitions here.

```

\iow_log:e 10603 \cs_new_protected:Npn \iow_log:n { \iow_now:Nn \c_log_iow }
\iow_log:x 10604 \cs_set_protected:Npn \iow_log:e { \iow_now:Ne \c_log_iow }
\iow_show:n 10605 \cs_generate_variant:Nn \iow_log:n { x }
\iow_show:e
\iow_term:n
\iow_term:e
\iow_term:x

```

```

10606 \cs_new_protected:Npn \iow_show:n { \iow_show:Nn \tex_showstream:D }
10607 \cs_set_protected:Npn \iow_show:e { \iow_show:Ne \tex_showstream:D }
10608 \cs_new_protected:Npn \iow_term:n { \iow_now:Nn \c_term_iow }
10609 \cs_set_protected:Npn \iow_term:e { \iow_now:Ne \c_term_iow }
10610 \cs_generate_variant:Nn \iow_term:n { x }

```

(End of definition for `\iow_log:n`, `\iow_show:n`, and `\iow_term:n`. These functions are documented on page 99.)

### 53.3.3 Special characters for writing

**`\iow_newline:`** Global variable holding the character that forces a new line when something is written to an output stream.

```

10611 \cs_new:Npn \iow_newline: { ^^J }

```

(End of definition for `\iow_newline:`. This function is documented on page 100.)

**`\iow_char:N`** Function to write any escaped char to an output stream.

```

10612 \cs_new_eq:NN \iow_char:N \cs_to_str:N

```

(End of definition for `\iow_char:N`. This function is documented on page 100.)

### 53.3.4 Hard-wrapping lines to a character count

The code here implements a generic hard-wrapping function. This is used by the messaging system, but is designed such that it is available for other uses.

**`\l_iow_line_count_int`** This is the “raw” number of characters in a line which can be written to the terminal. The standard value is the line length typically used by T<sub>E</sub>X Live and MiK<sub>T</sub>E<sub>X</sub>.

```

10613 \int_new:N \l_iow_line_count_int
10614 \int_set:Nn \l_iow_line_count_int { 78 }

```

(End of definition for `\l_iow_line_count_int`. This variable is documented on page 102.)

**`\l__iow_newline_tl`** The token list inserted to produce a new line, with the `<run-on text>`.

```

10615 \tl_new:N \l__iow_newline_tl

```

(End of definition for `\l__iow_newline_tl`.)

**`\l__iow_line_target_int`** This stores the target line count: the full number of characters in a line, minus any part for a leader at the start of each line.

```

10616 \int_new:N \l__iow_line_target_int

```

(End of definition for `\l__iow_line_target_int`.)

**`\__iow_set_indent:n`** The `one_indent` variables hold one indentation marker and its length. The `\__iow_unindent:w` auxiliary removes one indentation. The function `\__iow_set_indent:n` (that could possibly be public) sets the indentation in a consistent way. We set it to four spaces by default.

```

10617 \tl_new:N \l__iow_one_indent_tl
10618 \int_new:N \l__iow_one_indent_int
10619 \cs_new:Npn \__iow_unindent:w { }
10620 \cs_new_protected:Npn \__iow_set_indent:n #1
10621 {

```

```

10622 \__kernel_tl_set:Nx \l__iow_one_indent_tl
10623 { \exp_args:No \__kernel_str_to_other_fast:n { \tl_to_str:n {#1} } }
10624 \int_set:Nn \l__iow_one_indent_int
10625 { \str_count:N \l__iow_one_indent_tl }
10626 \exp_last_unbraced:NNo
10627 \cs_set:Npn \__iow_unindent:w \l__iow_one_indent_tl { }
10628 }
10629 \exp_args:Ne \__iow_set_indent:n { \prg_replicate:nn { 4 } { ~ } }

```

(End of definition for `\__iow_set_indent:n` and others.)

`\l__iow_indent_tl` The current indentation (some copies of `\l__iow_one_indent_tl`) and its number of  
`\l__iow_indent_int` characters.

```

10630 \tl_new:N \l__iow_indent_tl
10631 \int_new:N \l__iow_indent_int

```

(End of definition for `\l__iow_indent_tl` and `\l__iow_indent_int`.)

`\l__iow_line_tl` These hold the current line of text and a partial line to be added to it, respectively.  
`\l__iow_line_part_tl`

```

10632 \tl_new:N \l__iow_line_tl
10633 \tl_new:N \l__iow_line_part_tl

```

(End of definition for `\l__iow_line_tl` and `\l__iow_line_part_tl`.)

`\l__iow_line_break_bool` Indicates whether the line was broken precisely at a chunk boundary.

```

10634 \bool_new:N \l__iow_line_break_bool

```

(End of definition for `\l__iow_line_break_bool`.)

`\l__iow_wrap_tl` Used for the expansion step before detokenizing, and for the output from wrapping text:  
 fully expanded and with lines which are not overly long.

```

10635 \tl_new:N \l__iow_wrap_tl

```

(End of definition for `\l__iow_wrap_tl`.)

`\c__iow_wrap_marker_tl` Every special action of the wrapping code is starts with the same recognizable string,  
`\c__iow_wrap_end_marker_tl` `\c__iow_wrap_marker_tl`. Upon seeing that “word”, the wrapping code reads one space-  
`\c__iow_wrap_newline_marker_tl` delimited argument to know what operation to perform. The setting of `\escapechar` here  
`\c__iow_wrap_allow_break_marker_tl` is not very important, but makes `\c__iow_wrap_marker_tl` look marginally nicer.  
`\c__iow_wrap_indent_marker_tl`

```

10636 \group_begin:
10637 \int_set:Nn \tex_escapechar:D { -1 }
10638 \tl_const:Ne \c__iow_wrap_marker_tl
10639 { \tl_to_str:n { \^^I \^^O \^^W \^^_ \^^W \^^R \^^A \^^P } }
10640 \group_end:
10641 \tl_map_inline:nn
10642 { { end } { newline } { allow_break } { indent } { unindent } }
10643 {
10644 \tl_const:ce { c__iow_wrap_ #1 _marker_tl }
10645 {
10646 \c__iow_wrap_marker_tl
10647 #1
10648 \catcode_other_space_tl
10649 }
10650 }

```

(End of definition for `\c__iow_wrap_marker_tl` and others.)

**`\iow_wrap_allow_break:`** We set `\iow_wrap_allow_break:n` to produce an error when outside messages. Within wrapped message, it is set to `\__iow_wrap_allow_break:` when valid and otherwise to `\__iow_wrap_allow_break_error:`. The second produces an error expandably.

```

10651 \cs_new_protected:Npn \iow_wrap_allow_break:
10652 {
10653   \msg_error:nnnn { kernel } { iow-indent }
10654   { \iow_wrap:nnnN } { \iow_wrap_allow_break: }
10655 }
10656 \cs_new:Npe \__iow_wrap_allow_break: { \c__iow_wrap_allow_break_marker_tl }
10657 \cs_new:Npn \__iow_wrap_allow_break_error:
10658 {
10659   \msg_expandable_error:nnnn { kernel } { iow-indent }
10660   { \iow_wrap:nnnN } { \iow_wrap_allow_break: }
10661 }

```

(End of definition for `\iow_wrap_allow_break:`, `\__iow_wrap_allow_break:`, and `\__iow_wrap_allow_break_error:`. This function is documented on page 101.)

**`\iow_indent:n`** We set `\iow_indent:n` to produce an error when outside messages. Within wrapped message, it is set to `\__iow_indent:n` when valid and otherwise to `\__iow_indent_error:n`. The first places the instruction for increasing the indentation before its argument, and the instruction for unindenting afterwards. The second produces an error expandably. Note that there are no forced line-break, so the indentation only changes when the next line is started.

```

10662 \cs_new_protected:Npn \iow_indent:n #1
10663 {
10664   \msg_error:nnnnn { kernel } { iow-indent }
10665   { \iow_wrap:nnnN } { \iow_indent:n } { #1 }
10666   #1
10667 }
10668 \cs_new:Npe \__iow_indent:n #1
10669 {
10670   \c__iow_wrap_indent_marker_tl
10671   #1
10672   \c__iow_wrap_unindent_marker_tl
10673 }
10674 \cs_new:Npn \__iow_indent_error:n #1
10675 {
10676   \msg_expandable_error:nnnnn { kernel } { iow-indent }
10677   { \iow_wrap:nnnN } { \iow_indent:n } { #1 }
10678   #1
10679 }

```

(End of definition for `\iow_indent:n`, `\__iow_indent:n`, and `\__iow_indent_error:n`. This function is documented on page 101.)

**`\iow_wrap:nnnN`** The main wrapping function works as follows. First give `\\`, `\_` and other formatting commands the correct definition for messages and perform the given setup #3. The definition of `\_` uses an “other” space rather than a normal space, because the latter might be absorbed by  $\TeX$  to end a number or other f-type expansions. Use `\conditionally@traceoff` if defined; it is introduced by the `trace` package and suppresses uninteresting tracing of the wrapping code.

```

10680 \cs_new_protected:Npn \iow_wrap:nnnN #1#2#3#4
10681 {
10682   \group_begin:
10683     \cs_if_exist_use:N \conditionally@traceoff
10684     \int_set:Nn \tex_escapechar:D { -1 }
10685     \cs_set:Npe \{ { \token_to_str:N \{ }
10686     \cs_set:Npe \# { \token_to_str:N \# }
10687     \cs_set:Npe \} { \token_to_str:N \} }
10688     \cs_set:Npe \% { \token_to_str:N \% }
10689     \cs_set:Npe \~ { \token_to_str:N \~ }
10690     \int_set:Nn \tex_escapechar:D { 92 }
10691     \cs_set_eq:NN \ \ \iow_newline:
10692     \cs_set_eq:NN \ \c_catcode_other_space_tl
10693     \cs_set_eq:NN \iow_wrap_allow_break: \__iow_wrap_allow_break:
10694     \cs_set_eq:NN \iow_indent:n \__iow_indent:n
10695     #3

```

Then fully-expand the input: in package mode, the expansion uses L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>’s `\protect` mechanism in the same way as `\typeout`. In generic mode this setting is useless but harmless. As soon as the expansion is done, reset `\iow_indent:n` to its error definition: it only works in the first argument of `\iow_wrap:nnnN`.

```

10696     \cs_set_eq:NN \protect \token_to_str:N
10697     \__kernel_tl_set:Nx \l__iow_wrap_tl {#1}
10698     \cs_set_eq:NN \iow_wrap_allow_break: \__iow_wrap_allow_break_error:
10699     \cs_set_eq:NN \iow_indent:n \__iow_indent_error:n

```

Afterwards, set the newline marker (two assignments to fully expand, then convert to a string) and initialize the target count for lines (the first line has target count `\l__iow_line_count_int` instead).

```

10700     \__kernel_tl_set:Nx \l__iow_newline_tl { \iow_newline: #2 }
10701     \__kernel_tl_set:Nx \l__iow_newline_tl { \tl_to_str:N \l__iow_newline_tl }
10702     \int_set:Nn \l__iow_line_target_int
10703     { \l__iow_line_count_int - \str_count:N \l__iow_newline_tl + 1 }

```

Sanity check.

```

10704     \int_compare:nNnT { \l__iow_line_target_int } < 0
10705     {
10706       \tl_set:Nn \l__iow_newline_tl { \iow_newline: }
10707       \int_set:Nn \l__iow_line_target_int
10708       { \l__iow_line_count_int + 1 }
10709     }

```

There is then a loop over the input, which stores the wrapped result in `\l__iow_wrap_tl`. After the loop, the resulting text is passed on to the function which has been given as a post-processor. The `\tl_to_str:N` step converts the “other” spaces back to normal spaces. The f-expansion removes a leading space from `\l__iow_wrap_tl`.

```

10710     \__iow_wrap_do:
10711     \exp_args:NNf \group_end:
10712     #4 { \tl_to_str:N \l__iow_wrap_tl }
10713   }
10714   \cs_generate_variant:Nn \iow_wrap:nnnN { ne }

```

(End of definition for `\iow_wrap:nnnN`. This function is documented on page 101.)

`\__iow_wrap_do:` Escape spaces and change newlines to `\c__iow_wrap_newline_marker_tl`. Set up a few variables, in particular the initial value of `\l__iow_wrap_tl`: the space stops the `f`-expansion of the main wrapping function and `\use_none:n` removes a newline marker inserted by later code. The main loop consists of repeatedly calling the `chunk` auxiliary to wrap chunks delimited by (newline or indentation) markers.

```

10715 \cs_new_protected:Npn \__iow_wrap_do:
10716 {
10717   \__kernel_tl_set:Nx \l__iow_wrap_tl

(End of definition for `\__iow_sep:`.)

`\__iow_wrap_chunk:nw` The `chunk` and `next` auxiliaries are defined indirectly to obtain the expansions of `\c_catcode_other_space_tl` and `\c__iow_wrap_marker_tl` in their definition. The `next` auxiliary calls a function corresponding to the type of marker (its `##2`), which can be `newline` or `indent` or `unindent` or `end`. The first argument of the `chunk` auxiliary is a target number of characters and the second is some string to wrap. If the chunk is empty simply call `next`. Otherwise, set up a call to `\__iow_wrap_line:nw`, including the indentation if the current line is empty, and including a trailing space (`#1`) before the `\__iow_wrap_end_chunk:w` auxiliary.

`\__iow_wrap_next:nw`

```

\__iow_wrap_line_seven:nnnnnn
\__iow_wrap_line_end:NnnnnnnN
\__iow_wrap_line_end:nw
\__iow_wrap_end_chunk:w

```

This is followed by `{⟨string⟩⟨int expr⟩ \__iow_sep:}`. It stores the `⟨string⟩` and up to `⟨int expr⟩` characters from the current chunk into `\l__iow_line_part_tl`. Characters are grabbed 8 at a time and left in `\l__iow_line_part_tl` by the `line_loop` auxiliary. When  $k < 8$  remain to be found, the `line_aux` auxiliary calls the `line_end` auxiliary followed by (the single digit)  $k$ , then  $7-k$  empty brace groups, then the chunk's remaining characters. The `line_end` auxiliary leaves  $k$  characters from the chunk in the line part, then ends the assignment. Ignore the `\use_none:nnnnn` line for now. If the next character is a space the line can be broken there: store what we found into the result and get the next line. Otherwise some work is needed to find a break-point. So far we have ignored what happens if the chunk is shorter than the requested number of characters: this is dealt with by the `end_chunk` auxiliary, which gets treated like a character by the rest of the code. It ends up being called either as one of the arguments #2–#9 of the `line_loop` auxiliary or as one of the arguments #2–#8 of the `line_end` auxiliary. In both cases stop the assignment and work out how many characters are still needed. Notice that when we have exactly seven arguments to clean up, a `\exp_stop_f:` has to be inserted to stop the `\exp:w`. The weird `\use_none:nnnnn` ensures that the required data is in the right place.

(End of definition for \\_\_iow\_wrap\_line:nw and others.)

\\_\_iow\_wrap\_break:w  
 \\_\_iow\_wrap\_break\_first:w  
 \\_\_iow\_wrap\_break\_none:w  
 \\_\_iow\_wrap\_break\_loop:w  
 \\_\_iow\_wrap\_break\_end:w

Functions here are defined indirectly: \\_\_iow\_tmp:w is eventually called with an “other” space as its argument. The goal is to remove from \l\_\_iow\_line\_part\_tl the part after the last space. In most cases this is done by repeatedly calling the break\_loop

auxiliary, which leaves “words” (delimited by spaces) until it hits the trailing space: then its argument ##3 is ? \\_iow\_wrap\_break\_end:w instead of a single token, and that break\_end auxiliary leaves in the assignment the line until the last space, then calls \\_iow\_wrap\_line\_end:nw to finish up the line and move on to the next. If there is no space in \l\_iow\_line\_part\_tl then the break\_first auxiliary calls the break\_none auxiliary. In that case, if the current line is empty, the complete word (including ##4, characters beyond what we had grabbed) is added to the line, making it over-long. Otherwise, the word is used for the following line (and the last space of the line so far is removed because it was inserted due to the presence of a marker).

10877   }
10878 }

```

(End of definition for \\_\_iow\_wrap\_next\_line:w.)

\\_\_iow\_wrap\_allow\_break:n This is called after a chunk has been wrapped. The \l\_\_iow\_line\_part\_tl typically ends with a space (except at the beginning of a line?), which we remove since the **allow-break** marker should not insert a space. Then move on with the next chunk, making sure to adjust the target number of characters for the line in case we did remove a space.

```

10879 \cs_new_protected:Npn \__iow_wrap_allow_break:n #1
10880 {
10881   \__kernel_tl_set:Nx \l__iow_line_tl
10882   { \l__iow_line_tl \__iow_wrap_trim:N \l__iow_line_part_tl }
10883   \bool_set_false:N \l__iow_line_break_bool
10884   \tl_if_empty:NTF \l__iow_line_part_tl
10885   { \__iow_wrap_chunk:nw {#1} }
10886   { \exp_args:Nf \__iow_wrap_chunk:nw { \int_eval:n { #1 + 1 } } }
10887 }

```

(End of definition for \\_\_iow\_wrap\_allow\_break:n.)

\\_\_iow\_wrap\_indent:n These functions are called after a chunk has been wrapped, when encountering **indent/unindent** markers. Add the line part (last line part of the previous chunk) to the line so far and reset a boolean denoting the presence of a line-break. Most importantly, add or remove one indent from the current indent (both the integer and the token list). Finally, continue wrapping.

\\_\_iow\_wrap\_unindent:n

```

10888 \cs_new_protected:Npn \__iow_wrap_indent:n #1
10889 {
10890   \tl_put_right:Ne \l__iow_line_tl { \l__iow_line_part_tl }

10904 }

```

(End of definition for \\_\_iow\_wrap\_indent:n and \\_\_iow\_wrap\_unindent:n.)

`\__iow_wrap_newline:n` These functions are called after a chunk has been line-wrapped, when encountering a  
`\__iow_wrap_end:n` **newline/end** marker. Unless we just took a line-break, store the line part and the line  
so far into the whole `\l__iow_wrap_tl`, trimming a trailing space. In the **newline** case  
look for a new line (of length `\l__iow_line_target_int`) in a new chunk.

```

10905 \cs_new_protected:Npn \__iow_wrap_newline:n #1
10906 {
10907   \bool_if:NF \l__iow_line_break_bool
10908     { \__iow_wrap_store_do:n { \__iow_wrap_trim:N } }
10909   \bool_set_false:N \l__iow_line_break_bool
10910   \__iow_wrap_chunk:nw { \l__iow_line_target_int }
10911 }
10912 \cs_new_protected:Npn \__iow_wrap_end:n #1
10913 {
10914   \bool_if:NF \l__iow_line_break_bool
10915     { \__iow_wrap_store_do:n { \__iow_wrap_trim:N } }
10916   \bool_set_false:N \l__iow_line_break_bool
10917 }

```

(End of definition for `\__iow_wrap_newline:n` and `\__iow_wrap_end:n`.)

`\__iow_wrap_store_do:n` First add the last line part to the line, then append it to `\l__iow_wrap_tl` with the  
appropriate new line (with “run-on” text), possibly with its last space removed (#1 is  
empty or `\__iow_wrap_trim:N`).

```

10918 \cs_new_protected:Npn \__iow_wrap_store_do:n #1
10919 {
10920   \__kernel_tl_set:Nx \l__iow_line_tl

## 53.4 File operations

`\l__file_tmp_tl` Used as a short-term scratch variable.

```
10940 \tl_new:N \l__file_tmp_tl
```

*(End of definition for \l\_\_file\_tmp\_tl.)*

`\g_file_curr_dir_str`  
`\g_file_curr_ext_str`  
`\g_file_curr_name_str` The name of the current file should be available at all times: the name itself is set dynamically.

```
10941 \str_new:N \g_file_curr_dir_str
```

```
10942 \str_new:N \g_file_curr_ext_str
```

```
10943 \str_new:N \g_file_curr_name_str
```

*(End of definition for \g\_file\_curr\_dir\_str, \g\_file\_curr\_ext\_str, and \g\_file\_curr\_name\_str. These variables are documented on page 102.)*

`\g__file_stack_seq` The input list of files is stored as a sequence stack. In package mode we can recover the information from the details held by L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> (we must be in the preamble and loaded using `\usepackage` or `\RequirePackage`). As L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> doesn't store directory and name separately, we stick to the same convention here. In pre-loading, `\@currnamestack` is empty so is skipped.

10968 \group_end:
```

*(End of definition for \g\_\_file\_stack\_seq.)*

`\g__file_record_seq` The total list of files used is recorded separately from the current file stack, as nothing is ever popped from this list. The current file name should be included in the file list! We will eventually copy the contents of `\@filelist`.

```
10969 \seq_new:N \g__file_record_seq
```

(End of definition for `\g__file_record_seq`.)

`\l__file_base_name_tl` For storing the basename and full path whilst passing data internally.

`\l__file_full_name_tl` 10970 `\tl_new:N \l__file_base_name_tl`  
10971 `\tl_new:N \l__file_full_name_tl`

(End of definition for `\l__file_base_name_tl` and `\l__file_full_name_tl`.)

`\l__file_dir_str` Used in parsing a path into parts: in contrast to the above, these are never used outside  
`\l__file_ext_str` of the current module.

`\l__file_name_str` 10972 `\str_new:N \l__file_dir_str`  
10973 `\str_new:N \l__file_ext_str`  
10974 `\str_new:N \l__file_name_str`

(End of definition for `\l__file_dir_str`, `\l__file_ext_str`, and `\l__file_name_str`.)

`\l_file_search_path_seq` The current search path.

10975 `\seq_new:N \l_file_search_path_seq`

(End of definition for `\l_file_search_path_seq`. This variable is documented on page 103.)

`\l__file_tmp_seq` Scratch space for comma list conversion.

10976 `\seq_new:N \l__file_tmp_seq`

(End of definition for `\l__file_tmp_seq`.)

### 53.4.1 Internal auxiliaries

`\s__file_stop` Internal scan marks.

10977 `\scan_new:N \s__file_stop`

(End of definition for `\s__file_stop`.)

`\q__file_nil` Internal quarks.

10978 `\quark_new:N \q__file_nil`

(End of definition for `\q__file_nil`.)

`\__file_quark_if_nil_p:n` Branching quark conditional.

`\__file_quark_if_nil:nTF` 10979 `\__kernel_quark_new_conditional:Nn \__file_quark_if_nil:n { TF }`

(End of definition for `\__file_quark_if_nil:nTF`.)

`\q_file_recursion_tail` Internal recursion quarks.

`\q_file_recursion_stop` 10980 `\quark_new:N \q_file_recursion_tail`  
10981 `\quark_new:N \q_file_recursion_stop`

(End of definition for `\q_file_recursion_tail` and `\q_file_recursion_stop`.)

`\_file_if_recursion_tail_break:NN` Functions to query recursion quarks.

`\_file_if_recursion_tail_stop:nn` 10982 `\__kernel_quark_new_test:N \_file_if_recursion_tail_stop:N`  
10983 `\__kernel_quark_new_test:N \_file_if_recursion_tail_stop:nn`

(End of definition for `\_file_if_recursion_tail_break:NN` and `\_file_if_recursion_tail_stop-do:nn`.)

```

\__kernel_file_name_sanitize:n
\__file_name_expand:n
\__file_name_expand_cleanup:Nw
\__file_name_expand_cleanup:w
\__file_name_expand_end:
\__file_name_expand_error:Nw
\__file_name_expand_error_aux:Nw
\__file_name_strip_quotes:n
\__file_name_strip_quotes:nnw
\__file_name_strip_quotes:nnn
\__file_name_trim_spaces:n
\__file_name_trim_spaces:nw
\__file_name_trim_spaces_aux:n
\__file_name_trim_spaces_aux:w

```

Expanding the file name uses a `\csname`-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to a expansion-safe version using `\ifcsname`. This is less conservative than the token-by-token approach used before, but it is much faster.

```

10984 \cs_new:Npn \__kernel_file_name_sanitize:n #1
10985 {
10986   \exp_args:Ne \__file_name_trim_spaces:n
10987   {
10988     \exp_args:Ne \__file_name_strip_quotes:n
10989     { \__file_name_expand:n {#1} }
10990   }
10991 }

```

We'll use `\cs:w` to start expanding the file name, and to avoid creating csnames equal to `\relax` with “common” names, there's a prefix `__file_name=` to the csname. There's also a guard token at the end so we can check if there was an error during the process and (try to) clean up gracefully.

```

10992 \cs_new:Npn \__file_name_expand:n #1
10993 {
10994   \exp_after:wN \__file_name_expand_cleanup:Nw
10995   \cs:w __file_name = #1 \cs_end:
10996   \__file_name_expand_end:
10997 }

```

With the csname built, we grab it, and grab the remaining tokens delimited by `\__file_name_expand_end:`. If there are any remaining tokens, something bad happened, so we'll call the error procedure `\__file_name_expand_error:Nw`. If everything went according to plan, then use `\token_to_str:N` on the csname built, and call `\__file_name_expand_cleanup:w` to remove the prefix we added a while back. `\__file_name_expand_cleanup:w` takes a leading argument so we don't have to bother about the value of `\tex_escapechar:D`.

```

10998 \cs_new:Npn \__file_name_expand_cleanup:Nw #1 #2 \__file_name_expand_end:
10999 {
11000   \tl_if_empty:nF {#2}
11001   { \__file_name_expand_error:Nw #2 \__file_name_expand_end: }
11002   \exp_after:wN \__file_name_expand_cleanup:w \token_to_str:N #1
11003 }
11004 \exp_last_unbraced:NNNNo
11005 \cs_new:Npn \__file_name_expand_cleanup:w #1 \tl_to_str:n { __file_name = } { }

```

In non-error cases `\__file_name_expand_end:` should not expand. It will only do so in case there is a `\csname` too much in the file name, so it will throw an error (while expanding), then insert the missing `\cs_end:` and yet another `\__file_name_expand_end:` that will be used as a delimiter by `\__file_name_expand_cleanup:Nw` (or that will expand again if yet another `\endcsname` is missing).

```

11006 \cs_new:Npn \__file_name_expand_end:
11007 {
11008   \msg_expandable_error:nn
11009   { kernel } { filename-missing-endcsname }
11010   \cs_end: \__file_name_expand_end:
11011 }

```

Now to the error case. `\__file_name_expand_error:Nw` adds an extra `\cs_end:` so that in case there was an extra `\csname` in the file name, then `\__file_name_expand_error_aux:Nw` throws the error.

```

11012 \cs_new:Npn \__file_name_expand_error:Nw #1 #2 \__file_name_expand_end:
11013 { \__file_name_expand_error_aux:Nw #1 #2 \cs_end: \__file_name_expand_end: }
11014 \cs_new:Npn \__file_name_expand_error_aux:Nw #1 #2 \cs_end: #3
11015 \__file_name_expand_end:
11016 {
11017   \msg_expandable_error:nnff
11018     { kernel } { filename-chars-lost }
11019     { \token_to_str:N #1 } { \exp_stop_f: #2 }
11020 }

```

Quoting file name uses basically the same approach as for `luaquotejobname:` count the " tokens and remove them.

```

11021 \cs_new:Npn \__file_name_strip_quotes:n #1
11022 {
11023   \__file_name_strip_quotes:nw { 0 }
11024   #1 " \q__file_recursion_tail " \q__file_recursion_stop {#1}
11025 }
11026 \cs_new:Npn \__file_name_strip_quotes:nw #1#2 "

`\__file_size:n` A copy of the primitive where it's available.

```

11109 \cs_new_eq:NN \__file_size:n \tex_filesize:D

```

(End of definition for `\__file_size:n`.)

`\file_full_name:n` File searching can be carried out if the `\pdffilesize` primitive or an equivalent is available. That of course means we need to arrange for everything else to here to be done by expansion too. We start off by sanitizing the name and quoting if required: we may need to remove those quotes, so the raw name is passed too.

```

\__file_full_name:n
\__file_full_name_aux:n
\__file_full_name_auxi:nn
\__file_full_name_auxii:nn
\__file_full_name_aux:Nnn

\__file_name_ext_check:nnw
\__file_name_ext_check:nnnw
\__file_name_ext_check:nnnn
\__file_name_ext_check:nnnn
11110 \cs_new:Npn \file_full_name:n #1
11111 {
11112   \exp_args:Ne \__file_full_name:n
11113   { \__kernel_file_name_sanitiz:n {#1} }
11114 }
11115 \cs_generate_variant:Nn \file_full_name:n { V }
11116 \cs_new:Npn \__file_full_name:n #1
11117 {
11118   \tl_if_blank:nF {#1}
11119   { \exp_args:Nne \__file_full_name_auxii:nn {#1} { \__file_full_name_aux:n {#1} } }
11120 }

```

First, we check if the file is just here: no mapping so we do not need the break part of the broader auxiliary. We are using the fact that the primitive here returns nothing if the file is entirely absent. To avoid unnecessary filesystem lookups, the result of `\pdffilesize` is kept available as an argument. For package mode, `\input@path` is a token list not a sequence.

To avoid repeated reading of files we need to cache the loading: this is important as the code here is used by *all* file checks. The same marker is used in the L<sup>A</sup>T<sub>E</sub>X<sub>2<sub>ε</sub></sub> kernel, meaning that we get a double-saving with for example `\IfFileExists`. As this is all about performance, we use the low-level approach for the conditionals. For a file already seen, the size is reported as `-1` so it's distinct from any non-cached ones.

```

11121 \cs_new:Npn \__file_full_name_aux:n #1
11122 {

```

```

11123     \if_cs_exist:w __file_seen_ \tl_to_str:n {#1} : \cs_end:
11124     -1
11125     \else:
11126         \exp_args:Ne \__file_full_name_auxi:nn { \__file_size:n {#1} } {#1}
11127     \fi:
11128 }

```

We will need the size of files later, and we have to avoid the `\scan_stop:` causing issues if we are raising the flag. Thus there is a slightly odd gobble here.

```

11129 \cs_new:Npn \__file_full_name_auxi:nn #1#2
11130 {
11131     \if:w \scan_stop: #1 \scan_stop:

```

(End of definition for \file\_full\_name:n and others. This function is documented on page 105.)

**\file\_forget:n** Just a wrapper around a csname: we have to do a lookup here to make sure any paths are handled.

```

11218 \cs_new_protected:Npn \file_forget:n #1
11219 { \cs_undefine:c { __file_seen_ \file_full_name:n {#1} : } }

```

(End of definition for \file\_forget:n. This function is documented on page 103.)

```

\file_get_full_name:nN
\file_get_full_name:VN
\file_get_full_name:nNTF
\file_get_full_name:VNTF
  \_file_get_full_name_search:nN

```

These functions pre-date using \tex\_filesize:D for file searching, so are get functions with protection. To avoid having different search set ups, they are simply wrappers around the code above.

```

11220 \cs_new_protected:Npn \file_get_full_name:nN #1#2
11221 {
11222   \file_get_full_name:nNF {#1} #2
11223   { \tl_set:Nn #2 { \q_no_value } }
11224 }
11225 \cs_generate_variant:Nn \file_get_full_name:nN { V }
11226 \prg_new_protected_conditional:Npnn \file_get_full_name:nN #1#2 { T , F , TF }
11227 {
11228   \__kernel_tl_set:Nx #2
11229   { \file_full_name:n {#1} }
11230   \tl_if_empty:NTF #2
11231   { \prg_return_false: }
11232   { \prg_return_true: }
11233 }
11234 \prg_generate_conditional_variant:Nnn \file_get_full_name:nN
11235 { V } { T , F , TF }

```

(End of definition for \file\_get\_full\_name:nN, \file\_get\_full\_name:nNTF, and \\_file\_get\_full\_name\_search:nN. These functions are documented on page 105.)

\g\_\_file\_tmp\_ior A reserved stream to test for opening a shell.

```

11236 \ior_new:N \g__file_tmp_ior

```

(End of definition for \g\_\_file\_tmp\_ior.)

```

\file_md5five_hash:n
\file_md5five_hash:V
  \file_size:n
  \file_size:V
  \file_timestamp:n
  \file_timestamp:V
  \_file_details:nn
\_file_details_aux:nn
\_file_md5five_hash:n

```

Getting file details by expansion is relatively easy if a bit repetitive. As the MD5 function has a slightly different syntax from the other commands, there is a little cleaning up to do.

```

11237 \cs_new:Npn \file_size:n #1
11238 { \_file_details:nn {#1} { size } }
11239 \cs_generate_variant:Nn \file_size:n { V }

11513 \exp_args_generate:n { nne }

```

(End of definition for \file\_input\_raw:n and \\_\_file\_input\_raw:nn. This function is documented on page 107.)

**\file\_parse\_full\_name:n** The main parsing macro \file\_parse\_full\_name\_apply:nN passes the file name #1 through \\_\_kernel\_file\_name\_sanitize:n so that we have a single normalised way to treat files internally. \file\_parse\_full\_name:n uses the former, with \prg\_do\_nothing: to leave each part of the name within a pair of braces.

**\file\_parse\_full\_name\_apply:nN**

**\file\_parse\_full\_name\_apply:VN**

```

11514 \cs_new:Npn \file_parse_full_name:n #1
11515 {
11516     \file_parse_full_name_apply:nN {#1}
11517     \prg_do_nothing:
11518 }
11519 \cs_generate_variant:Nn \file_parse_full_name:n { V }
11520 \cs_new:Npn \file_parse_full_name_apply:nN #1
11521 {
11522     \exp_args:Ne \__file_parse_full_name_auxi:nN
11523     { \__kernel_file_name_sanitiz:n {#1} }
11524 }
11525 \cs_generate_variant:Nn \file_parse_full_name_apply:nN { V }

```

\\_\_file\_parse\_full\_name\_area:nw splits the file name into chunks separated by /, until the last one is reached. The last chunk is the file name plus the extension, and everything before that is the path. When \\_\_file\_parse\_full\_name\_area:nw is done, it leaves the path within braces after the scan mark \s\_\_file\_stop and proceeds parsing the actual file name.

```

\__file_parse_full_name_auxi:nN
\__file_parse_full_name_area:nw
11526 \cs_new:Npn \__file_parse_full_name_auxi:nN #1
11527 {
11528     \__file_parse_full_name_area:nw { } #1
11529     / \s__file_stop
11530 }
11531 \cs_new:Npn \__file_parse_full_name_area:nw #1 #2 / #3 \s__file_stop
11532 {
11533     \tl_if_empty:nTF {#3}
11534     { \__file_parse_full_name_base:nw { } #2 . \s__file_stop {#1} }
11535     { \__file_parse_full_name_area:nw { #1 / #2 } #3 \s__file_stop }
11536 }

```

\\_\_file\_parse\_full\_name\_base:nw does roughly the same as above, but it separates the chunks at each period. However here there's some extra complications: In case #1 is empty, it is assumed that the extension is actually empty, and the file name is #2. Besides, an extra . has to be added to #2 because it is later removed in \\_\_file\_parse\_full\_name\_tidy:nnnN. In any case, if there's an extension, it is returned with a leading ..

```

\__file_parse_full_name_base:nw
11537 \cs_new:Npn \__file_parse_full_name_base:nw #1 #2 . #3 \s__file_stop
11538 {
11539     \tl_if_empty:nTF {#3}
11540     {
11541         \tl_if_empty:nTF {#1}
11542         {
11543             \tl_if_empty:nTF {#2}
11544             { \__file_parse_full_name_tidy:nnnN { } { } }
11545             { \__file_parse_full_name_tidy:nnnN { .#2 } { } }
11546         }
11547         { \__file_parse_full_name_tidy:nnnN {#1} { .#2 } }
11548     }
11549     { \__file_parse_full_name_base:nw { #1 . #2 } #3 \s__file_stop }
11550 }

```

Now we just need to tidy some bits left loose before. The loop used in the two macros above start with a leading / and . in the file path an name, so here we need to remove

them, except in the path, if it is a single /, in which case it's left as is. After all's done, pass to #4.

```

11551 \cs_new:Npn \__file_parse_full_name_tidy:nnnN #1 #2 #3 #4
11552 {
11553   \exp_args:Nee #4
11554   {
11555     \str_if_eq:nnF {#3} { / } { \use_none:n }
11556     #3 \prg_do_nothing:
11557   }
11558   { \use_none:n #1 \prg_do_nothing: }
11559   {#2}
11560 }

```

(End of definition for \file\_parse\_full\_name:n and others. These functions are documented on page 106.)

\file\_parse\_full\_name:nNNN  
\file\_parse\_full\_name:VNNN

```

11561 \cs_new_protected:Npn \file_parse_full_name:nNNN #1 #2 #3 #4
11562 {

11567 {
11568   \str_set:Nn #4 {#1}
11569   \str_set:Nn #5 {#2}
11570   \str_set:Nn #6 {#3}
11571 }
11572 \cs_generate_variant:Nn \file_parse_full_name:nNNN { V }

```

(End of definition for \file\_parse\_full\_name:nNNN. This function is documented on page 106.)

\file\_show\_list: A function to list all files used to the log, without duplicates. In package mode, if  
\file\_log\_list: \@filelist is still defined, we need to take this list of file names into account (we  
\\_\_file\_list:N capture it \AtBeginDocument into \g\_\_file\_record\_seq), turning it to a string (this  
\\_\_file\_list\_aux:n does not affect the commas of this comma list).

```

11573 \cs_new_protected:Npn \file_show_list: { \__file_list:N \msg_show:nneeee }
11574 \cs_new_protected:Npn \file_log_list: { \__file_list:N \msg_log:nneeee }
11575 \cs_new_protected:Npn \__file_list:N #1
11576 {
11577   \seq_clear:N \l__file_tmp_seq
11578   \clist_if_exist:NT \@filelist
11579   {
11580     \exp_args:NNe \seq_set_from_clist:Nn \l__file_tmp_seq
11581     { \tl_to_str:N \@filelist }
11582   }
11583   \seq_concat:NNN \l__file_tmp_seq \l__file_tmp_seq \g__file_record_seq
11584   \seq_remove_duplicates:N \l__file_tmp_seq
11585   #1 { kernel } { file-list }
11586   { \seq_map_function:NN \l__file_tmp_seq \__file_list_aux:n }
11587   { } { } { }
11588 }
11589 \cs_new:Npn \__file_list_aux:n #1 { \iow_newline: #1 }

```

(End of definition for `\file_show_list:` and others. These functions are documented on page 107.)

When used as a package, there is a need to hold onto the standard file list as well as the new one here. File names recorded in `\@filelist` must be turned to strings before being added to `\g__file_record_seq`.

```

11590 \cs_if_exist:NT \@filelist
11591 {
11592   \AtBeginDocument
11593   {
11594     \exp_args:NNe \seq_set_from_clist:Nn \l__file_tmp_seq
11595     { \tl_to_str:N \@filelist }
11596     \seq_gconcat:NNN
11597     \g__file_record_seq
11598     \g__file_record_seq
11599     \l__file_tmp_seq
11600   }
11601 }

```

## 53.5 GetIdInfo

`\GetIdInfo` As documented in `expl3.dtx` this function extracts file name etc from an SVN Id line. This used to be how we got version number and so on in all modules, so it had to be defined in `l3bootstrap`. Now it's more convenient to define it after we have set up quite a lot of tools, and `l3file` seems the least unreasonable place for it.

The idea here is to extract out the information needed from a standard SVN Id line, but to avoid a line that would get changed when the file is checked in. Hence the fact that none of the lines here include both a dollar sign and the Id keyword!

```

11602 \cs_new_protected:Npn \GetIdInfo
11603 {
11604   \tl_clear_new:N \ExplFileDescription
11605   \tl_clear_new:N \ExplFileDate
11606   \tl_clear_new:N \ExplFileName
11607   \tl_clear_new:N \ExplFileExtension
11608   \tl_clear_new:N \ExplFileVersion
11609   \group_begin:
11610   \char_set_catcode_space:n { 32 }
11611   \exp_after:wN
11612   \group_end:
11613   \__file_id_info_auxi:w
11614 }

```

A first check for a completely empty SVN field. If that is not the case, there is a second case when a file created using `svn cp` but has not been checked in. That leaves a special marker `-1` version, which has no further data. Dealing correctly with that is the reason for the space in the line to use `\__file_id_info_auxii:w`.

```

11615 \cs_new_protected:Npn \__file_id_info_auxi:w $ #1 $ #2
11616 {
11617   \tl_set:Nn \ExplFileDescription {#2}
11618   \str_if_eq:nnTF {#1} { Id }
11619   {
11620     \tl_set:Nn \ExplFileDate { 0000/00/00 }
11621     \tl_set:Nn \ExplFileName { [unknown] }
11622     \tl_set:Nn \ExplFileExtension { [unknown~extension] }

```

```

11623         \tl_set:Nn \ExplFileVersion {-1}
11624     }
11625     { \__file_id_info_auxii:w #1 ~ \s__file_stop }
11626 }

```

Here, #1 is Id, #2 is the file name, #3 is the extension, #4 is the version, #5 is the check in date and #6 is the check in time and user, plus some trailing spaces. If #4 is the marker -1 value then #5 and #6 are empty.

```

11627 \cs_new_protected:Npn \__file_id_info_auxii:w
11628     #1 ~ #2.#3 ~ #4 ~ #5 ~ #6 \s__file_stop
11629 {
11630     \tl_set:Nn \ExplFileName {#2}
11631     \tl_set:Nn \ExplFileExtension {#3}
11632     \tl_set:Nn \ExplFileVersion {#4}
11633     \str_if_eq:nnTF {#4} {-1}
11634     { \tl_set:Nn \ExplFileDate { 0000/00/00 } }
11635     { \__file_id_info_auxiii:w #5 - 0 - 0 - \s__file_stop }
11636 }

```

Convert an SVN-style date into a L<sup>A</sup>T<sub>E</sub>X-style one.

```

11637 \cs_new_protected:Npn \__file_id_info_auxiii:w #1 - #2 - #3 - #4 \s__file_stop
11638 { \tl_set:Nn \ExplFileDate { #1/#2/#3 } }

```

(End of definition for \GetIdInfo and others. This function is documented on page 11.)

## 53.6 Checking the version of kernel dependencies

This function is responsible for checking if dependencies of the L<sup>A</sup>T<sub>E</sub>X3 kernel match the version preloaded in the L<sup>A</sup>T<sub>E</sub>X2<sub>ε</sub> kernel. If versions don't match, the function attempts to tell why by searching for a possible stray format file.

The function starts by checking that the kernel date is defined, and if not zero is used to force the error route. The kernel date is then compared with the argument requested date (usually the packaging date of the dependency). If the kernel date is less than the required date, it's an error and the loading should abort.

```

11639 \cs_new_protected:Npn \__kernel_dependency_version_check:Nn #1
11640 { \exp_args:NV \__kernel_dependency_version_check:nn #1 }
11641 \cs_new_protected:Npn \__kernel_dependency_version_check:nn #1
11642 {
11643     \cs_if_exist:NTF \c__kernel_expl_date_tl
11644     {
11645         \exp_args:NV \__file_kernel_dependency_compare:nnn
11646         \c__kernel_expl_date_tl {#1}
11647     }
11648     { \__file_kernel_dependency_compare:nnn { 0000-00-00 } {#1} }
11649 }
11650 \cs_new_protected:Npn \__file_kernel_dependency_compare:nnn #1 #2 #3
11651 {
11652     \int_compare:nNtT
11653     { \__file_parse_version:w #1 \s__file_stop } <
11654     { \__file_parse_version:w #2 \s__file_stop }
11655     { \__file_mismatched_dependency_error:nn {#2} {#3} }
11656 }
11657 \cs_new:Npn \__file_parse_version:w #1 - #2 - #3 \s__file_stop {#1#2#3}

```

If the versions differ, then we try to give the user some guidance. This function starts by taking the engine name `\c_sys_engine_str` and replacing `tex` by `latex`, then building a command of the form: `kpsewhich -all -engine=<engine> <format>[-dev].fmt` to query the format files available. A shell is opened and each line is read into a sequence.

```
\_file_mismatched_dependency_error:nn
11658 \cs_new_protected:Npn \_file_mismatched_dependency_error:nn #1 #2
11659 {
11660   \exp_args:NNe \ior_shell_open:Nn \g__file_tmp_ior
11661   {
11662     kpsewhich ~ --all ~
11663     --engine = \c_sys_engine_exec_str
11664     \c_space_tl \c_sys_engine_format_str
11665     \bool_lazy_and:nnT
11666       { \tl_if_exist_p:N \development@branch@name }
11667       { ! \tl_if_empty_p:N \development@branch@name }
11668     { -dev } .fmt
11669   }
11670   \seq_clear:N \l__file_tmp_seq
11671   \ior_map_inline:Nn \g__file_tmp_ior
11672     { \seq_put_right:Nn \l__file_tmp_seq {##1} }
11673   \ior_close:N \g__file_tmp_ior
11674   \msg_error:nnnn { kernel } { mismatched-support-file }
11675   {#1} {#2}
```

And finish by ending the current file.

```
11676   \tex_endinput:D
11677 }
```

Now define the actual error message:

```
11678 \msg_new:nnnn { kernel } { mismatched-support-file }
11679 {
11680   Mismatched~LaTeX~support~files~detected. \\
11681   Loading~'#2'~aborted!
```

`\c__kernel_expl_date_tl` may not exist, due to an older format, so only print the dates when the sentinel token list exists:

```
11682   \tl_if_exist:NT \c__kernel_expl_date_tl
11683   {
11684     \\ \\
11685     The~L3~programming~layer~in~the~LaTeX~format \\
11686     is~dated~\c__kernel_expl_date_tl,~but~in~your~TeX~
11687     tree~the~files~require \\ at~least~#1.
11688   }
11689 }
11690 {
```

The sequence containing the format files should have exactly one item: the format file currently being run. If that's the case, the cause of the error is not that, so print a generic help with some possible causes. If more than one format file was found, then print the list to the user, with appropriate indications of what's in the system and what's in the user tree.

```
11691   \int_compare:nNnTF { \seq_count:N \l__file_tmp_seq } > 1
11692   {
11693     The~cause~seems~to~be~an~old~format~file~in~the~user~tree. \\
11694     LaTeX~found~these~files:
11695     \seq_map_tokens:Nn \l__file_tmp_seq { \\---\use:n } \\
```

```

11696     Try-deleting-the~file~in~the~user~tree~then~run~LaTeX~again.
11697   }
11698   {
11699     The~most~likely~causes~are:
11700     \\~~~A~recent~format~generation~failed;
11701     \\~~~A~stray~format~file~in~the~user~tree~which~needs~
11702       to~be~removed~or~rebuilt;
11703     \\~~~You~are~running~a~manually~installed~version~of~#2 \\
11704     \ \ \ which~is~incompatible~with~the~version~in~LaTeX. \\
11705   }
11706   \\
11707   LaTeX~will~abort~loading~the~incompatible~support~files~
11708   but~this~may~lead~to \\ later~errors.~Please~ensure~that~
11709   your~LaTeX~format~is~correctly~regenerated.
11710 }

```

(End of definition for `\__kernel_dependency_version_check:Nn` and others.)

## 53.8 Functions delayed from earlier modules

<@@=sys>

**\c\_sys\_platform\_str** Detecting the platform on LuaTeX is easy: for other engines, we use the fact that the two common cases have special null files. It is possible to probe further (see package `ifplatform`), but that requires shell escape and seems unlikely to be useful. This is set up here as it requires file searching.

```

11748 \sys_if_engine luatex:TF
11749 {
11750     \str_const:Ne \c_sys_platform_str
11751     { \tex_directlua:D { tex.print(os.type) } }
11752 }
11753 {
11754     \file_if_exist:nTF { nul: }
11755     {
11756         \file_if_exist:nF { /dev/null }
11757         { \str_const:Nn \c_sys_platform_str { windows } }
11758     }
11759     {
11760         \file_if_exist:nT { /dev/null }
11761         { \str_const:Nn \c_sys_platform_str { unix } }
11762     }
11763 }
11764 \cs_if_exist:NF \c_sys_platform_str
11765 { \str_const:Nn \c_sys_platform_str { unknown } }

```

(End of definition for `\c_sys_platform_str`. This variable is documented on page 79.)

**\sys\_if\_platform\_unix\_p:** We can now set up the tests.

```

11766 \clist_map_inline:nn { unix , windows }
11767 {
11768     \__file_const:nn { sys_if_platform_ #1 }
11769     { \str_if_eq_p:Vn \c_sys_platform_str { #1 } }
11770 }

```

(End of definition for `\sys_if_platform_unix:TF` and `\sys_if_platform_windows:TF`. These functions are documented on page 79.)

```

### 54.1 Breaking out to Lua

```
11773 <*code>
```

```
\__lua_escape:n Copies of primitives.
\__lua_now:n      11774 \cs_new_eq:NN \__lua_escape:n \tex_luaescapestring:D
\__lua_shipout:n 11775 \cs_new_eq:NN \__lua_now:n      \tex_directlua:D
                  11776 \cs_new_eq:NN \__lua_shipout:n \tex_latelua:D
```

*(End of definition for \\_\_lua\_escape:n, \\_\_lua\_now:n, and \\_\_lua\_shipout:n.)*

These functions are set up in l3str for bootstrapping: we want to replace them with a “proper” version at this stage, so clean up.

```
11777 \cs_undefine:N \lua_escape:e
11778 \cs_undefine:N \lua_now:e
```

```
\lua_now:n Wrappers around the primitives.
\lua_now:e  11779 \cs_new:Npn \lua_now:e #1 { \__lua_now:n {#1} }
\lua_shipout_e:n 11780 \cs_new:Npn \lua_now:n #1 { \lua_now:e { \exp_not:n {#1} } }
\lua_shipout:n  11781 \cs_new_protected:Npn \lua_shipout_e:n #1 { \__lua_shipout:n {#1} }
\lua_escape:n   11782 \cs_new_protected:Npn \lua_shipout:n #1
\lua_escape:e   11783 { \lua_shipout_e:n { \exp_not:n {#1} } }
                  11784 \cs_new:Npn \lua_escape:e #1 { \__lua_escape:n {#1} }
                  11785 \cs_new:Npn \lua_escape:n #1 { \lua_escape:e { \exp_not:n {#1} } }
```

*(End of definition for \lua\_now:n and others. These functions are documented on page 108.)*

```
\lua_load_module:n Wrapper around require'<module>'.
                  11786 \str_new:N \l__lua_err_msg_str
                  11787 \cs_new_protected:Npn \lua_load_module:n #1
                  11788 {
                  11789   \bool_if:nF { \__lua_load_module_p:n { #1 } }
                  11790   {
                  11791     \msg_error:nnnV
                  11792     { luatex } { module-not-found } { #1 } \l__lua_err_msg_str
                  11793   }
                  11794 }
```

(End of definition for `\lua_load_module:n`. This function is documented on page 109.)

As with engines other than LuaTeX these have to be macros, we give them the same status in all cases. When LuaTeX is not in use, simply give an error message/

```

## 54.3 Lua functions for internal use

```

11837 (*lua)

```

Most of the emulation of pdfTeX here is based heavily on Heiko Oberdiek's pdfTeX-cmds package.

**ltx.utils** Create a table for the kernel's own use.

```
11838 ltx = ltx or {utils={}}
11839 ltx.utils = ltx.utils or { }
11840 local ltxutils = ltx.utils
```

*(End of definition for ltx.utils. This function is documented on page 109.)*

Local copies of global tables.

```
11841 local io      = io
11842 local kpse     = kpse
11843 local lfs      = lfs
11844 local math     = math
11845 local md5      = md5
11846 local os       = os
11847 local string   = string
11848 local tex      = tex
11849 local texio    = texio
11850 local tonumber = tonumber
```

Local copies of standard functions.

```
11851 local abs      = math.abs
11852 local byte     = string.byte
11853 local floor    = math.floor
11854 local format   = string.format
11855 local gsub     = string.gsub
11856 local lfs_attr = lfs.attributes
11857 local open     = io.open
11858 local os_date  = os.date
11859 local setcatcode = tex.setcatcode
11860 local sprint   = tex.sprint
11861 local cprint   = tex.cprint
11862 local write    = tex.write
11863 local write_nl = texio.write_nl
11864 local utf8_char = utf8.char
11865 local package_loaded = package.loaded
11866 local package_searchers = package.searchers
11867 local table_concat = table.concat
11868
11869 local scan_int    = token.scan_int or token.scan_integer
11870 local scan_string = token.scan_string
11871 local scan_keyword = token.scan_keyword
11872 local put_next   = token.put_next
11873 local token_create = token.create
11874 local token_new   = token.new
11875 local set_macro   = token.set_macro
```

Since token.create only returns useful values after the tokens has been added to TeX's hash table, we define a variant which defines it first if necessary.

```
11876 local token_create_safe
11877 do
11878   local is_defined = token.is_defined
11879   local set_char   = token.set_char or tex.chardef
11880   local runtoks    = tex.runtoks
```

```

11881 local let_token = token_create'let'
11882
11883 function token_create_safe(s)
11884   local orig_token = token_create(s)
11885   if is_defined(s, true) then
11886     return orig_token
11887   end
11888   set_char(s, 0)
11889   local new_token = token_create(s)
11890   runtoks(function()
11891     put_next(let_token, new_token, orig_token)
11892   end)
11893   return new_token
11894 end
11895 end
11896
11897 local true_tok = token_create_safe'prg_return_true:'
11898 local false_tok = token_create_safe'prg_return_false:'

```

In ConTeXt `lmtx token.command_id` does not exist, but it can easily be emulated with ConTeXt's `tokens.commands`.

```

11899 local command_id = token.command_id
11900 if not command_id and tokens and tokens.commands then
11901   local id_map = tokens.commands
11902   function command_id(name)
11903     return id_map[name]
11904   end
11905 end

```

Deal with ConTeXt: doesn't use `kpse` library.

```

11906 local kpse_find = (resolvers and resolvers.findfile) or kpse.find_file

```

**escapehex** An internal auxiliary to convert a string to the matching hex escape. This works on a byte basis: extension to handled UTF-8 input is covered in `pdftexcmds` but is not currently required here.

```

11907 local function escapehex(str)
11908   return (gsub(str, ".",
11909     function (ch) return format("%02X", byte(ch)) end))
11910 end

```

*(End of definition for escapehex.)*

**ltx.utils.filedump** Similar comments here to the next function: read the file in binary mode to avoid any line-end weirdness.

```

11911 local function filedump(name,offset,length)
11912   local file = kpse_find(name,"tex",true)
11913   if not file then return end
11914   local f = open(file,"rb")
11915   if not f then return end
11916   if offset and offset > 0 then
11917     f:seek("set", offset)
11918   end
11919   local data = f:read(length or 'a')
11920   f:close()
11921   return escapehex(data)

```

```

11922 end
11923 ltxutils.filedump = filedump

```

(End of definition for `ltx.utils.filedump`. This function is documented on page 109.)

`md5.HEX` Hash a string and return the hash in uppercase hexadecimal format. In some engines, this is built-in. For traditional Lua<sub>T<sub>E</sub>X</sub>, the conversion to hexadecimal has to be done by us.

```

11924 local md5_HEX = md5.HEX
11925 if not md5_HEX then
11926   local md5_sum = md5.sum
11927   function md5_HEX(data)
11928     return escapehex(md5_sum(data))
11929   end
11930   md5.HEX = md5_HEX
11931 end

```

(End of definition for `md5.HEX`.)

`ltx.utils.filemd5sum` Read an entire file and hash it: the hash function itself is a built-in. As Lua is byte-based there is no work needed here in terms of UTF-8 (see `pdftexcmds` and how it handles strings that have passed through Lua<sub>T<sub>E</sub>X</sub>). The file is read in binary mode so that no line ending normalisation occurs.

```

11932 local function filemd5sum(name)
11933   local file = kpse_find(name, "tex", true) if not file then return end
11934   local f = open(file, "rb") if not f then return end
11935
11936   local data = f:read("*a")
11937   f:close()
11938   return md5_HEX(data)
11939 end
11940 ltxutils.filemd5sum = filemd5sum

```

(End of definition for `ltx.utils.filemd5sum`. This function is documented on page 109.)

`ltx.utils.filemoddate` There are two cases: If the C standard library is C99 compliant, we can use `%z` to get the timezone in almost the right format. We only have to add primes and replace a zero or missing offset with Z.

Of course this would be boring, so Windows does things differently. There we have to manually calculate the offset. See procedure `makepdftime` in `utils.c` of pdf<sub>T<sub>E</sub>X</sub>.

```

11941 local filemoddate
11942 if os_date'%z':match'^[+-%d%d%d%d$' then
11943   local pattern = lpeg.Cs(16 *
11944     (lpeg.Cg(lpeg.S'+-' * '0000' * lpeg.Cc'Z')
11945     + 3 * lpeg.Cc'"' * 2 * lpeg.Cc'"'
11946     + lpeg.Cc'Z')
11947     * -1)
11948   function filemoddate(name)
11949     local file = kpse_find(name, "tex", true)
11950     if not file then return end
11951     local date = lfs_attr(file, "modification")
11952     if not date then return end
11953     return pattern:match(os_date("D:%Y%m%d%H%M%S%z", date))
11954   end

```

```

11955 else
11956   local function filemoddate(name)
11957     local file = kpse_find(name, "tex", true)
11958     if not file then return end
11959     local date = lfs_attr(file, "modification")
11960     if not date then return end
11961     local d = os_date("*t", date)
11962     local u = os_date("!*t", date)
11963     local off = 60 * (d.hour - u.hour) + d.min - u.min
11964     if d.year ~= u.year then
11965       if d.year > u.year then
11966         off = off + 1440
11967       else
11968         off = off - 1440
11969       end
11970     elseif d.yday ~= u.yday then
11971       if d.yday > u.yday then
11972         off = off + 1440
11973       else
11974         off = off - 1440
11975       end
11976     end
11977     local timezone
11978     if off == 0 then
11979       timezone = "Z"
11980     else
11981       if off < 0 then
11982         timezone = "-"
11983         off = -off
11984       else
11985         timezone = "+"
11986       end
11987       timezone = format("%s%02d'%02d'", timezone, hours // 60, hours % 60)
11988     end
11989     return format("D:%04d%02d%02d%02d%02d%s",
11990       d.year, d.month, d.day, d.hour, d.min, d.sec, timezone)
11991   end
11992 end
11993 ltxutils.filemoddate = filemoddate

```

*(End of definition for ltx.utils.filemoddate. This function is documented on page 109.)*

**ltx.utils.filesize** A simple disk lookup.

```

11994 local function filesize(name)
11995   local file = kpse_find(name, "tex", true)
11996   if file then
11997     local size = lfs_attr(file, "size")
11998     if size then
11999       return size
12000     end
12001   end
12002 end
12003 ltxutils.filesize = filesize

```

*(End of definition for ltx.utils.filesize. This function is documented on page 110.)*

luacmd An internal function for defining control sequences from Lua which behave like primitives. This acts as a wrapper around `token.set_lua` which accepts a function instead of an index into the functions table.

```

12004 local luacmd do
12005   local set_lua = token.set_lua
12006   local undefined_cs = command_id'undefined_cs'
12007
12008   if not context and not luatexbase then require'ltluatex' end
12009   if luatexbase then
12010     local new_luafunction = luatexbase.new_luafunction
12011     local functions = lua.get_functions_table()
12012     function luacmd(name, func, ...)
12013       local id
12014       local tok = token_create(name)
12015       if tok.command == undefined_cs then
12016         id = new_luafunction(name)
12017         set_lua(name, id, ...)
12018       else
12019         id = tok.index or tok.mode
12020       end
12021       functions[id] = func
12022     end
12023   elseif context then
12024     local register = context.functions.register
12025     local functions = context.functions.known
12026     function luacmd(name, func, ...)
12027       local tok = token_create(name)
12028       if tok.command == undefined_cs then
12029         token.set_lua(name, register(func), ...)
12030       else
12031         functions[tok.index or tok.mode] = func
12032       end
12033     end
12034   end
12035 end

```

*(End of definition for luacmd.)*

try\_require Loads a Lua module. This function loads the module similarly to the standard Lua global function `require`, with a few differences. On success, `try_require` returns `true, module`. If the module cannot be found, it returns `false, err_msg`. If the module is found, but something goes wrong when loading it, the function throws an error.

```

12036 local function try_require(name)
12037   if package_loaded[name] then
12038     return true, package_loaded[name]
12039   end
12040
12041   local failure_details = {}
12042   for _, searcher in ipairs(package_searchers) do
12043     local loader, data = searcher(name)
12044     if type(loader) == 'function' then
12045       package_loaded[name] = loader(name, data) or true
12046       return true, package_loaded[name]
12047     elseif type(loader) == 'string' then

```

```

12048         failure_details[#failure_details + 1] = loader
12049     end
12050 end
12051
12052     return false, table_concat(failure_details, '\n')
12053 end

```

*(End of definition for try\_require.)*

`\__lua_load_module_p:n` Check to see if we can load a module using `require`. If we can load the module, then we load it immediately. Otherwise, we save the error message in `\l_@@_err_msg_str`.

```

12054 local char_given = command_id'char_given'
12055 local c_true_bool = token_create(1, char_given)
12056 local c_false_bool = token_create(0, char_given)
12057 local c_str_cctab = token_create('c_str_cctab').mode
12058
12059 luacmd('\__lua_load_module_p:n', function()
12060     local success, result = try_require(scan_string())
12061     if success then
12062         set_macro(c_str_cctab, 'l__lua_err_msg_str', '')
12063         put_next(c_true_bool)
12064     else
12065         set_macro(c_str_cctab, 'l__lua_err_msg_str', result)
12066         put_next(c_false_bool)
12067     end
12068 end)

```

*(End of definition for \\_\_lua\_load\_module\_p:n.)*

## 54.4 Preserving iniTeX Lua data for runs

The Lua state is not dumped when a format is written, therefore any Lua variables filled doing format building need to be restored in order to be accessible during normal runs.

We provide some kernel-internal helpers for this. They will only be available if `luatexbase` is available. This is not a big restriction though, because ConTeXt (which does not use `luatexbase`) does not load `expl3` in the format.

```

12069 local register_luaadata, get_luaadata
12070
12071 if luatexbase then
12072     local register = token_create'@expl@luaadata@bytecode'.index

```

`register_luaadata` `register_luaadata` is only available during format generation. It accept a string which uniquely identifies the data object and has to be provided to retrieve it later. Additionally it accepts a function which is called in the `pre_dump` callback and which has to return a string that evaluates to a valid Lua object to be preserved. Note that format generation does not necessarily mean the first run, because some packages such as `mylatexformat` generates a format based on an existing format.

```

12073     if status.ini_version then
12074         local luaadata, luaadata_order = {}, {}
12075
12076         function register_luaadata(name, func)
12077             if luaadata[name] then

```

```

12078         error(format("LaTeX error: data name %q already in use", name))
12079     end
12080     luadata[name] = func
12081     luadata_order[#luadata_order + 1] = func and name
12082 end

```

*(End of definition for register\_luadata.)*

The actual work is done in `pre_dump`. The `luadata_order` is used to ensure that the order is consistent over multiple runs.

```

12083     luatexbase.add_to_callback("pre_dump", function()
12084         if next(luadata) then
12085             local str = "return {"
12086             for i=1, #luadata_order do
12087                 local name = luadata_order[i]
12088                 str = format('%s[%q]=%s,', str, name, luadata[name]())
12089             end
12090             lua.bytecode[register] = assert(load(str .. "}"))
12091         end
12092     end, "ltx.luadata")
12093 end

```

`get_luadata` `get_luadata` is only available if data should be restored. It accept the identifier which was used when the data object was registered and returns the associated object. Every object can only be retrieved once. Note that it is possible for both `register_luadata` and `get_luadata` to be available, for example while compiling a precompiled preamble. In such a case, data must be registered again to be kept in the next run.

```

12094     local luadata = lua.bytecode[register]
12095     if luadata then
12096         lua.bytecode[register] = nil
12097         luadata = luadata()
12098         function get_luadata(name)
12099             if not luadata then return end
12100             local data = luadata[name]
12101             luadata[name] = nil
12102             return data
12103         end
12104     end
12105 end

```

*(End of definition for get\_luadata.)*

```

12106 </lua>

```

## Chapter 55

# 13legacy implementation

12107 `<*code>`

12108 `<@@=legacy>`

`\legacy_if_p:n` A friendly wrapper. We need to use the `\if:w` approach here, rather than testing against `\iftrue`/`\iffalse` as the latter approach fails for primitive conditionals such as `\ifmmode`. The `\reverse_if:N` here means that we get a slightly more useful error if the name is undefined.

`\legacy_if:nTF`

```
12109 \prg_new_conditional:Npnn \legacy_if:n #1 { p , T , F , TF }
12110 {
12111   \exp_after:wN \reverse_if:N
12112   \cs:w if#1 \cs_end:
12113   \prg_return_false:
12114   \else:
12115     \prg_return_true:
12116   \fi:
12117 }
```

*(End of definition for `\legacy_if:nTF`. This function is documented on page 111.)*

`\legacy_if_set_true:n` A friendly wrapper.

`\legacy_if_set_false:n`

`\legacy_if_gset_true:n`

`\legacy_if_gset_false:n`

```
12118 \cs_new_protected:Npn \legacy_if_set_true:n #1
12119 { \cs_set_eq:cN { if#1 } \if_true: }
12120 \cs_new_protected:Npn \legacy_if_set_false:n #1
12121 { \cs_set_eq:cN { if#1 } \if_false: }
12122 \cs_new_protected:Npn \legacy_if_gset_true:n #1
12123 { \cs_gset_eq:cN { if#1 } \if_true: }
12124 \cs_new_protected:Npn \legacy_if_gset_false:n #1
12125 { \cs_gset_eq:cN { if#1 } \if_false: }
```

*(End of definition for `\legacy_if_set_true:n` and others. These functions are documented on page 111.)*

`\legacy_if_set:nn` A more elaborate wrapper.

`\legacy_if_gset:nn`

```
12126 \cs_new_protected:Npn \legacy_if_set:nn #1#2
12127 {
12128   \bool_if:nTF {#2} \legacy_if_set_true:n \legacy_if_set_false:n
12129   {#1}
12130 }
```

```

12131 \cs_new_protected:Npn \legacy_if_gset:nn #1#2
12132 {
12133   \bool_if:nTF {#2} \legacy_if_gset_true:n \legacy_if_gset_false:n
12134   {#1}
12135 }

```

*(End of definition for \legacy\_if\_set:nn and \legacy\_if\_gset:nn. These functions are documented on page [111](#).)*

```

12136 \</code>

```

## Chapter 56

# l3tl implementation

```
12137 <*code>
```

```
12138 <@@=tl>
```

A token list variable is a  $\text{\TeX}$  macro that holds tokens. By using the  $\varepsilon\text{-TeX}$  primitive `\unexpanded` inside a  $\text{\TeX}$  `\edef` it is possible to store any tokens, including `#`, in this way.

### 56.1 Functions

`\__kernel_tl_set:Nx` These two are supplied to get better performance for macros which would otherwise use `\tl_set:Ne` or `\tl_gset:Ne` internally.

```
12139 \cs_new_eq:NN \__kernel_tl_set:Nx \cs_set_nopar:Npe
```

```
12140 \cs_new_eq:NN \__kernel_tl_gset:Nx \cs_gset_nopar:Npe
```

(End of definition for `\__kernel_tl_set:Nx` and `\__kernel_tl_gset:Nx`.)

**`\tl_new:N`** Creating new token list variables is a case of checking for an existing definition and doing the definition.

`\tl_new:c`

```
12141 \cs_new_protected:Npn \tl_new:N #1
```

```
12142 {
```

```
12143     \__kernel_chk_if_free_cs:N #1
```

```
12144     \cs_gset_eq:NN #1 \c_empty_tl
```

```
12145 }
```

```
12146 \cs_generate_variant:Nn \tl_new:N { c }
```

(End of definition for `\tl_new:N`. This function is documented on page 113.)

**`\tl_const:Nn`** Constants are also easy to generate. They use `\cs_gset_nopar:Npe` instead of `\__kernel_tl_gset:Nx` so that the correct scope checking for `c`, instead of for `g`, is applied when `\debug_on:n { check-declarations }` is used. Constant assignment functions are patched specially in `l3debug` to apply such checks.

`\tl_const:cn`

```
12147 \cs_new_protected:Npn \tl_const:Nn #1#2
```

`\tl_const:cV`

```
12148 {
```

`\tl_const:ce`

```
12149     \__kernel_chk_if_free_cs:N #1
```

`\tl_const:cx`

```
12150     \cs_gset_nopar:Npe #1 { \__kernel_exp_not:w {#2} }
```

```
12151 }
```

```
12152 \cs_generate_variant:Nn \tl_const:Nn { NV , Ne , c , cV , ce }
```

```
12153 \cs_generate_variant:Nn \tl_const:Nn { Nx , cx }
```

(End of definition for `\tl_const:Nn`. This function is documented on page 114.)

`\tl_clear:N` Clearing a token list variable means setting it to an empty value. Error checking is sorted out by the parent function.

```
\tl_clear:c
\tl_gclear:N
\tl_gclear:c
12154 \cs_new_protected:Npn \tl_clear:N #1
12155 { \tex_let:D #1 = ~ \c_empty_tl }
12156 \cs_new_protected:Npn \tl_gclear:N #1
12157 { \tex_global:D \tex_let:D #1 ~ \c_empty_tl }
12158 \cs_generate_variant:Nn \tl_clear:N { c }
12159 \cs_generate_variant:Nn \tl_gclear:N { c }
```

(End of definition for `\tl_clear:N` and `\tl_gclear:N`. These functions are documented on page 114.)

`\tl_clear_new:N` Clearing a token list variable means setting it to an empty value. Error checking is sorted out by the parent function.

```
\tl_clear_new:c
\tl_gclear_new:N
\tl_gclear_new:c
12160 \cs_new_protected:Npn \tl_clear_new:N #1
12161 { \tl_if_exist:NTF #1 { \tl_clear:N #1 } { \tl_new:N #1 } }
12162 \cs_new_protected:Npn \tl_gclear_new:N #1
12163 { \tl_if_exist:NTF #1 { \tl_gclear:N #1 } { \tl_new:N #1 } }
12164 \cs_generate_variant:Nn \tl_clear_new:N { c }
12165 \cs_generate_variant:Nn \tl_gclear_new:N { c }
```

(End of definition for `\tl_clear_new:N` and `\tl_gclear_new:N`. These functions are documented on page 114.)

`\tl_set_eq:NN` For setting token list variables equal to each other. To allow for patching, the arguments have to be explicit. In addition this ensures that a braced second argument will not cause problems.

```
\tl_set_eq:Nc
\tl_set_eq:cN
\tl_set_eq:cc
\tl_gset_eq:NN
12166 \cs_new_protected:Npn \tl_set_eq:NN #1#2
12167 { \tex_let:D #1 = ~ #2 }
\tl_gset_eq:Nc
12168 \cs_new_protected:Npn \tl_gset_eq:NN #1#2
\tl_gset_eq:cN
12169 { \tex_global:D \tex_let:D #1 = ~ #2 }
\tl_gset_eq:cc
12170 \cs_generate_variant:Nn \tl_set_eq:NN { cN, Nc, cc }
12171 \cs_generate_variant:Nn \tl_gset_eq:NN { cN, Nc, cc }
```

(End of definition for `\tl_set_eq:NN` and `\tl_gset_eq:NN`. These functions are documented on page 114.)

`\tl_concat:NNN` Concatenating token lists is easy. When checking is turned on, all three arguments must be checked: a token list #2 or #3 equal to `\scan_stop:` would lead to problems later on.

```
\tl_concat:ccc
\tl_gconcat:NNN
12172 \cs_new_protected:Npn \tl_concat:NNN #1#2#3
12173 {
12174   \__kernel_tl_set:Nx #1
12175   {
12176     \__kernel_exp_not:w \exp_after:wN {#2}
12177     \__kernel_exp_not:w \exp_after:wN {#3}
12178   }
12179 }
12180 \cs_new_protected:Npn \tl_gconcat:NNN #1#2#3
12181 {
12182   \__kernel_tl_gset:Nx #1
12183   {
12184     \__kernel_exp_not:w \exp_after:wN {#2}
12185     \__kernel_exp_not:w \exp_after:wN {#3}

```

```

12186     }
12187   }
12188   \cs_generate_variant:Nn \tl_concat:NNN { ccc }
12189   \cs_generate_variant:Nn \tl_gconcat:NNN { ccc }

```

(End of definition for `\tl_concat:NNN` and `\tl_gconcat:NNN`. These functions are documented on page 114.)

```

\tl_if_exist_p:N Copies of the cs functions defined in l3basics.
\tl_if_exist_p:c 12190 \prg_new_eq_conditional:NNn \tl_if_exist:N \cs_if_exist:N { TF , T , F , p }
\tl_if_exist:NTF 12191 \prg_new_eq_conditional:NNn \tl_if_exist:c \cs_if_exist:c { TF , T , F , p }
\tl_if_exist:cTF

```

(End of definition for `\tl_if_exist:NTF`. This function is documented on page 114.)

## 56.2 Constant token lists

`\c_empty_tl` Never full. We need to define that constant before using `\tl_new:N`.

```
12192 \tl_const:Nn \c_empty_tl { }
```

(End of definition for `\c_empty_tl`. This variable is documented on page 131.)

`\c_novalue_tl` A special marker: as we don't have `\char_generate:nn` yet, has to be created the old-fashioned way.

```

12193 \group_begin:
12194 \tex_catcode:D '- = 11 ~
12195 \tl_const:Ne \c_novalue_tl { - NoValue \token_to_str:N - }
12196 \group_end:

```

(End of definition for `\c_novalue_tl`. This variable is documented on page 131.)

`\c_space_tl` A space as a token list (as opposed to as a character).

```
12197 \tl_const:Nn \c_space_tl { ~ }
```

(End of definition for `\c_space_tl`. This variable is documented on page 131.)

## 56.3 Adding to token list variables

`\tl_set:Nn` By using `\exp_not:n` token list variables can contain # tokens, which makes the token list registers provided by T<sub>E</sub>X more or less redundant. The `\tl_set:No` version is done by hand as it is used quite a lot.

```

\tl_set:Nv 12198 \cs_new_protected:Npn \tl_set:Nn #1#2
\tl_set:Ne 12199 { \__kernel_tl_set:Nx #1 { \__kernel_exp_not:w {#2} } }
\tl_set:Nf 12200 \cs_new_protected:Npn \tl_set:No #1#2
\tl_set:Nx 12201 { \__kernel_tl_set:Nx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
\tl_set:cn 12202 \cs_new_protected:Npn \tl_gset:Nn #1#2
\tl_set:cV 12203 { \__kernel_tl_gset:Nx #1 { \__kernel_exp_not:w {#2} } }
\tl_set:cv 12204 \cs_new_protected:Npn \tl_gset:No #1#2
\tl_set:co 12205 { \__kernel_tl_gset:Nx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
\tl_set:ce 12206 \cs_generate_variant:Nn \tl_set:Nn { NV , Nv , Ne , Nf }
\tl_set:cf 12207 \cs_generate_variant:Nn \tl_set:Nn { c , cV , cv , ce , cf }
\tl_set:cx 12208 \cs_generate_variant:Nn \tl_set:No { c }
\tl_set:cx 12209 \cs_generate_variant:Nn \tl_set:Nn { Nx , cx }
\tl_gset:Nn 12210 \cs_generate_variant:Nn \tl_gset:Nn { NV , Nv , Ne , Nf }

```

```

\tl_gset:Nv
\tl_gset:Nv
\tl_gset:No
\tl_gset:Ne
\tl_gset:Nf
\tl_gset:Nx
\tl_gset:cn
\tl_gset:cV
\tl_gset:cv
\tl_gset:co

```

```

12211 \cs_generate_variant:Nn \tl_gset:Nn { c, cV , cv , ce , cf }
12212 \cs_generate_variant:Nn \tl_gset:No { c }
12213 \cs_generate_variant:Nn \tl_gset:Nn { Nx , cx }

```

(End of definition for `\tl_set:Nn` and `\tl_gset:Nn`. These functions are documented on page 114.)

```

\tl_put_left:Nn Adding to the left is done directly to gain a little performance.
\tl_put_left:NV 12214 \cs_new_protected:Npn \tl_put_left:Nn #1#2
\tl_put_left:Nv 12215 {
\tl_put_left:Ne 12216   \__kernel_tl_set:Nx #1

(End of definition for `\__tl_if_recursion_tail_break:nN` and `\__tl_if_recursion_tail_stop:nTF`.)

## 56.5 Reassigning token list category codes

`\c__tl_rescan_marker_tl` The rescanning code needs a special token list containing the same character (chosen here to be a colon) with two different category codes: it cannot appear in the tokens being rescanned since all colons have the same category code.

```

12363 \tl_const:Ne \c__tl_rescan_marker_tl { : \token_to_str:N : }

```

(End of definition for `\c__tl_rescan_marker_tl`.)

```

\tl_set_rescan:Nnn In a group, after some initial setup explained below and the user setup #3 (followed by
\tl_set_rescan:NnV \scan_stop: to be safe), there is a call to \__tl_set_rescan:nNN. This shared auxiliary
\tl_set_rescan:Nne defined later distinguishes single-line and multi-line “files”. In the simplest case of multi-
\tl_set_rescan:Nno line files, it calls (with the same arguments) \__tl_set_rescan_multi:nNN, whose code
\tl_set_rescan:Nnx is included here to help understand the approach. This function rescans its argument #1,
\tl_set_rescan:cnv closes the group, and performs the assignment.
\tl_set_rescan:cne
\tl_set_rescan:cno
\tl_set_rescan:cnx

```

One difficulty when rescanning is that `\scantokens` treats the argument as a file, and without the correct settings a TeX error occurs:

```
! File ended while scanning definition of ...
```

```

\tl_gset_rescan:Nnn A related minor issue is a warning due to opening a group before the \scantokens and
\tl_gset_rescan:NnV closing it inside that temporary file; we avoid that by setting \tracingnesting. The
\tl_gset_rescan:Nne standard solution to the “File ended” error is to grab the rescanned tokens as a delimited
\tl_gset_rescan:Nno argument of an auxiliary, here \__tl_rescan:NNw, that performs the assignment, then let
\tl_gset_rescan:Nnx TeX “execute” the end of file marker. As usual in delimited arguments we use \prg_do_
\tl_gset_rescan:cnv nothing: to avoid stripping an outer set braces: this is removed by using o-expanding
\tl_gset_rescan:cne assignments. The delimiter cannot appear within the rescanned token list because it
\tl_gset_rescan:cno contains twice the same character, with different catcodes.
\tl_gset_rescan:cnx

```

For `\tl_rescan:nn` we cannot simply call `\__tl_set_rescan:NNnn \prg_do_nothing: \use:n` because that would leave the end-of-file marker *after* the result of rescanning. If that rescanned result is code that looks further in the input stream for arguments, it would break.

For multi-line files the only subtlety is that `\newlinechar` should be equal to `\endlinechar` because `\newlinechar` characters become new lines and then become

```

\__tl_rescan_aux:
\__tl_set_rescan:NNnn
\__tl_set_rescan_multi:nNN
\__tl_rescan:NNw

```

`\endlinechar` characters when writing to an abstract file and reading back. This equality is ensured by setting `\newlinechar` equal to `\endlinechar`. Prior to this, `\endlinechar` is set to `-1` if it was `32` (in particular true after `\ExplSyntaxOn`) to avoid unreasonable line-breaks at every space for instance in error messages triggered by the user setup. Another side effect of reading back from the file is that spaces (catcode 10) are ignored at the beginning of lines, and spaces and tabs (character code 32 and 9) are ignored at the end of lines.

The two `\if_false: ... \fi:` are there to prevent alignment tabs to cause a change of tabular cell while rescanning. We put the “opening” one after `\group_begin:` so that if one accidentally f-expands `\tl_set_rescan:Nnn` braces remain balanced. This is essential in e-type arguments when `\expanded` is not available.

```

```

\__tl_set_rescan:nNN
\__tl_set_rescan_single:nnNN
\__tl_set_rescan_single_aux:nnnNN
\__tl_set_rescan_single_aux:w

```

The function `\__tl_set_rescan:nNN` calls `\__tl_set_rescan_multi:nNN` or `\__tl_set_rescan_single:nnNN { ' }` depending on whether its argument is a single-line fragment of code/data or is made of multiple lines by testing for the presence of a `\newlinechar` character. If `\newlinechar` is out of range, the argument is assumed to be a single line.

For a single line, no `\endlinechar` should be added, so it is set to `-1`, and spaces should not be removed. Trailing spaces and tabs are a difficult matter, as `TEX` removes these at a very low level. The only way to preserve them is to rescan not the argument but the argument followed by a character with a reasonable category code. Here, `11` (letter) and `12` (other) are accepted, as these are convenient, suitable for delimiting an argument, and it is very unlikely that none of the ASCII characters are in one of these categories. To avoid selecting one particular character to put at the end, whose category code may have been modified, there is a loop through characters from `'` (ASCII 39) to `~` (ASCII 127). The choice of starting point was made because this is the start of a very long range of characters whose standard category is letter or other, thus minimizing the number of steps needed by the loop (most often just a single one). If no valid character is found (very rare), fall-back on `\__tl_set_rescan_multi:nNN`.

Otherwise, once a valid character is found (let us use `'` in this explanation) run some code very similar to `\__tl_set_rescan_multi:nNN` but with `'` added at both ends of the input. Of course, we need to define the auxiliary `\__tl_set_rescan_single:NNww` on the fly to remove the additional `'` that is just before `::` (by which we mean `\c__tl_set_rescan_marker_tl`). Note that the argument must be delimited by `'` with the current catcode; this is done thanks to `\char_generate:nn`. Yet another issue is that the rescanned token list may contain a comment character, in which case the `'` we expected is not there. We fix this as follows: rather than just `::` we set `\everyeof to ::{<code1>}'::{<code2>}` `\s__tl_stop`. The auxiliary `\__tl_set_rescan_single:NNww` runs the `o`-expanding assignment, expanding either `<code1>` or `<code2>` before its the main argument `#3`. In the typical case without comment character, `<code1>` is expanded, removing the leading `'`. In the rarer case with comment character, `<code2>` is expanded, calling `\__tl_set_rescan_single_aux:w`, which removes the trailing `::{<code1>}` and the leading `'`.

If the `\scantextokens` is available, the above is not all required: in particular, in LuaMetaTeX there is no `\scantokens` so something different is needed. We keep as much of the shared code path, but in this case `\everyeof` is unused (and we do not have to worry about end-of-file errors). Getting the documented behaviour for single versus multiple line input requires a bit of work; for the latter we need to add back in the `\endlinechar` that is deliberately omitted. That is a bit awkward as the engine really doesn't want to do this!

## 56.6 Modifying token list variables

`\tl_replace_once:Nnn` All of the `replace` functions call `\__tl_replace:NnnNnn` with appropriate arguments. The first two arguments are explained later. The next controls whether the replacement function calls itself (`\__tl_replace_next:w`) or stops (`\__tl_replace_wrap:w`) after the first replacement. Next comes an e-type assignment function `\tl_set:Ne` or `\tl_gset:Ne` for local or global replacements. Finally, the three arguments `<tl var>` `{<pattern>}` `{<replacement>}` provided by the user. When describing the auxiliary functions below, we denote the contents of the `<tl var>` by `<token list>`.

```

(End of definition for `\tl_replace_once:Nnn` and others. These functions are documented on page 128.)

To implement the actual replacement auxiliary `\__tl_replace_auxii:NnnNnn` we need a `<delimiter>` with the following properties:

- all occurrences of the `<pattern>` #6 in “`<token list>` `<delimiter>`” belong to the `<token list>` and have no overlap with the `<delimiter>`,
- the first occurrence of the `<delimiter>` in “`<token list>` `<delimiter>`” is the trailing `<delimiter>`.

We first find the building blocks for the  $\langle \text{delimiter} \rangle$ , namely two tokens  $\langle A \rangle$  and  $\langle B \rangle$  such that  $\langle A \rangle$  does not appear in #6 and #6 is not  $\langle B \rangle$  (this condition is trivial if #6 has more than one token). Then we consider the delimiters “ $\langle A \rangle$ ” and “ $\langle A \rangle \langle A \rangle^n \langle B \rangle \langle A \rangle^n \langle B \rangle$ ”, for  $n \geq 1$ , where  $\langle A \rangle^n$  denotes  $n$  copies of  $\langle A \rangle$ , and we choose as our  $\langle \text{delimiter} \rangle$  the first one which is not in the  $\langle \text{token list} \rangle$ .

Every delimiter in the set obeys the first condition: #6 does not contain  $\langle A \rangle$  hence cannot be overlapping with the  $\langle \text{token list} \rangle$  and the  $\langle \text{delimiter} \rangle$ , and it cannot be within the  $\langle \text{delimiter} \rangle$  since it would have to be in one of the two  $\langle B \rangle$  hence be equal to this single token (or empty, but this is an error case filtered separately). Given the particular form of these delimiters, for which no prefix is also a suffix, the second condition is actually a consequence of the weaker condition that the  $\langle \text{delimiter} \rangle$  we choose does not appear in the  $\langle \text{token list} \rangle$ . Additionally, the set of delimiters is such that a  $\langle \text{token list} \rangle$  of  $n$  tokens can contain at most  $O(n^{1/2})$  of them, hence we find a  $\langle \text{delimiter} \rangle$  with at most  $O(n^{1/2})$  tokens in a time at most  $O(n^{3/2})$ . Bear in mind that these upper bounds are reached only in very contrived scenarios: we include the case “ $\langle A \rangle$ ” in the list of delimiters to try, so that the  $\langle \text{delimiter} \rangle$  is simply  $\backslash \text{q\_tl\_mark}$  in the most common situation where neither the  $\langle \text{token list} \rangle$  nor the  $\langle \text{pattern} \rangle$  contains  $\backslash \text{q\_tl\_mark}$ .

Let us now ahead, optimizing for this most common case. First, two special cases: an empty  $\langle \text{pattern} \rangle$  #6 is an error, and if #1 is absent from both the  $\langle \text{token list} \rangle$  #5 and the  $\langle \text{pattern} \rangle$  #6 then we can use it as the  $\langle \text{delimiter} \rangle$  through  $\backslash \text{tl\_replace\_auxii:nNNNnn} \{ \#1 \}$ . Otherwise, we end up calling  $\backslash \text{tl\_replace:NnNNNnn}$  repeatedly with the first two arguments  $\backslash \text{q\_tl\_mark} \{ ? \}$ ,  $\backslash ? \{ ?? \}$ ,  $\backslash ?? \{ ??? \}$ , and so on, until #6 does not contain the control sequence #1, which we take as our  $\langle A \rangle$ . The argument #2 only serves to collect ? characters for #1. Note that the order of the tests means that the first two are done every time, which is wasteful (for instance, we repeatedly test for the emptiness of #6). However, this is rare enough not to matter. Finally, choose  $\langle B \rangle$  to be  $\backslash \text{q\_tl\_nil}$  or  $\backslash \text{q\_tl\_stop}$  such that it is not equal to #6.

The  $\backslash \text{tl\_replace\_auxi:NnnNNNnn}$  auxiliary receives  $\{ \langle A \rangle \}$  and  $\{ \langle A \rangle^n \langle B \rangle \}$  as its arguments, initially with  $n = 1$ . If “ $\langle A \rangle \langle A \rangle^n \langle B \rangle \langle A \rangle^n \langle B \rangle$ ” is in the  $\langle \text{token list} \rangle$  then increase  $n$  and try again. Once it is not anymore in the  $\langle \text{token list} \rangle$  we take it as our  $\langle \text{delimiter} \rangle$  and pass this to the  $\text{auxii}$  auxiliary.

12579     { \__tl_replace_auxii:nNNNnn { #2 #3 #3 } }
12580   }

```

The auxiliary `\__tl_replace_auxii:nNNNnn` receives the following arguments:

```

{<delimiter>} <function> <assignment>
<tl var> {<pattern>} {<replacement>}

```

All of its work is done between `\group_align_safe_begin:` and `\group_align_safe_end:` to avoid issues in alignments. It does the actual replacement within `#3 #4 {...}`, an e-expanding `<assignment> #3` to the `<tl var> #4`. The auxiliary `\__tl_replace_next:w` is called, followed by the `<token list>`, some tokens including the `<delimiter> #1`, followed by the `<pattern> #5`. This auxiliary finds an argument delimited by `#5` (the presence of a trailing `#5` avoids runaway arguments) and calls `\__tl_replace_wrap:w` to test whether this `#5` is found within the `<token list>` or is the trailing one.

If on the one hand it is found within the `<token list>`, then `##1` cannot contain the `<delimiter> #1` that we worked so hard to obtain, thus `\__tl_replace_wrap:w` gets `##1` as its own argument `##1`, and protects it against the e-expanding assignment. It also finds `\exp_not:n` as `##2` and does nothing to it, thus letting through `\exp_not:n {<replacement>}` into the assignment. Note that `\__tl_replace_next:w` and `\__tl_replace_wrap:w` are always called followed by two empty brace groups. These are safe because no delimiter can match them. They prevent losing braces when grabbing delimited arguments, but require the use of `\exp_not:o` and `\use_none:nn`, rather than simply `\exp_not:n`. Afterwards, `\__tl_replace_next:w` is called to repeat the replacement, or `\__tl_replace_wrap:w` if we only want a single replacement. In this second case, `##1` is the `<remaining tokens>` in the `<token list>` and `##2` is some `<ending code>` which ends the assignment and removes the trailing tokens `#5` using some `\if_false: { \fi: }` trickery because `#5` may contain any delimiter.

If on the other hand the argument `##1` of `\__tl_replace_next:w` is delimited by the trailing `<pattern> #5`, then `##1` is “`{ } { } <token list> <delimiter> {<ending code>}`”, hence `\__tl_replace_wrap:w` finds “`{ } { } <token list>`” as `##1` and the `<ending code>` as `##2`. It leaves the `<token list>` into the assignment and unbraces the `<ending code>` which removes what remains (essentially the `<delimiter>` and `<replacement>`).

## 56.7 Token list conditionals

These functions check whether the token list in the argument is empty and execute the proper code from their argument(s).

```

\tl_if_empty:N 12654 \prg_new_conditional:Npnn \tl_if_empty:N #1 { p , T , F , TF }
\tl_if_empty:cx 12655 {
\tl_if_empty:N 12656 \if_meaning:w #1 \c_empty_tl
\tl_if_empty:cx 12657 \prg_return_true:
\tl_if_empty:N 12658 \else:
\tl_if_empty:cx 12659 \prg_return_false:
\tl_if_empty:N 12660 \fi:
\tl_if_empty:N 12661 }
\tl_if_empty:NTF 12662 \prg_generate_conditional_variant:Nnn \tl_if_empty:N
\tl_if_empty:cTF 12663 { c } { p , T , F , TF }

```

(End of definition for `\tl_if_empty:NTF`. This function is documented on page 115.)

`\tl_if_empty_p:n` The `\if:w` triggers the expansion of `\tl_to_str:n` which converts the argument to a string: this is empty if and only if the argument is. Then `\if:w \scan_stop: ... \scan_stop:` is true if and only if the string ... is empty. It could be tempting to use `\if:w \scan_stop: #1 \scan_stop:` directly. But this fails on a token list expanding to anything starting with `\scan_stop:` leaving everything that follows in the input stream.

```

12664 \prg_new_conditional:Npnn \tl_if_empty:n #1 { p , TF , T , F }
12665 {
12666 \if:w \scan_stop: \tl_to_str:n {#1} \scan_stop:

12673 { V , e } { p , TF , T , F }

```

(End of definition for `\tl_if_empty:nTF`. This function is documented on page 115.)

`\tl_if_empty_p:o`  
`\tl_if_empty:oTF`  
`\__tl_if_empty_if:o`

The auxiliary function `\__tl_if_empty_if:o` is for use in various token list conditionals which reduce to testing if a given token list is empty after applying a simple function to it. The test for emptiness is based on `\tl_if_empty:nTF`, but the expansion is hard-coded for efficiency, as this auxiliary function is used in several places. We don't put `\prg_return_true:` and so on in the definition of the auxiliary, because that would prevent an optimization applied to conditionals that end with this code. Also the `\@@_if_empty_if:o` is expanded once in `\tl_if_empty:oTF` for efficiency as well (and to reduce code doubling).

```

12674 \cs_new:Npn \__tl_if_empty_if:o #1
12675 {
12676   \if:w \scan_stop: \__kernel_tl_to_str:w \exp_after:wN {#1} \scan_stop:
12677 }
12678 \exp_args:Nno \use:n
12679 { \prg_new_conditional:Npnn \tl_if_empty:o #1 { p , TF , T , F } }
12680 {
12681   \__tl_if_empty_if:o {#1}

12726 `\prg_return_false:`  
12727 `\fi:`  
12728 `}`  
12729 `\prg_generate_conditional_variant:Nnn \tl_if_eq:nn`  
12730 `{ nV , ne , nx , V , e , ee , x , xx }`  
12731 `{ TF , T , F }`

(End of definition for `\tl_if_eq:nnTF`. This function is documented on page 116.)

**`\tl_if_in:NnTF`** See `\tl_if_in:nnTF` for further comments. Here we simply expand the token list variable and pass it to `\tl_if_in:nnTF`.

`\tl_if_in:NvTF` 12732 `\cs_new_protected:Npn \tl_if_in:NnT { \exp_args:No \tl_if_in:nnT }`  
`\tl_if_in:cnTF` 12733 `\cs_new_protected:Npn \tl_if_in:NnF { \exp_args:No \tl_if_in:nnF }`  
`\tl_if_in:cVTF` 12734 `\cs_new_protected:Npn \tl_if_in:NnTF { \exp_args:No \tl_if_in:nnTF }`  
`\tl_if_in:coTF` 12735 `\prg_generate_conditional_variant:Nnn \tl_if_in:Nn`  
12736 `{ NV , No , c , cV , co } { T , F , TF }`

(End of definition for `\tl_if_in:NnTF`. This function is documented on page 116.)

`\tl_if_in:nnTF` Once more, the test relies on the emptiness test for robustness. The function `\__tl_tmp:w` removes tokens until the first occurrence of #2. If this does not appear in #1, then the final #2 is removed, leaving an empty token list. Otherwise some tokens remain, and the test is false. See `\tl_if_empty:nTF` for details on the emptiness test.

Treating correctly cases like `\tl_if_in:nnTF {a state}{states}`, where #1#2 contains #2 before the end, requires special care. To cater for this case, we insert `{ }{ }` between the two token lists. This marker may not appear in #2 because of T<sub>E</sub>X limitations on what can delimit a parameter, hence we are safe. Using two brace groups makes the test work also for empty arguments. The `\if_false:` constructions are a faster way to do `\group_align_safe_begin:` and `\group_align_safe_end:`. The `\scan_stop:` ensures that f-expanding `\tl_if_in:nnTF` does not lead to unbalanced braces.

```

12737 \prg_new_protected_conditional:Npnn \tl_if_in:nn #1#2 { T , F , TF }
12738 {
12739   \scan_stop:
12740   \if_false: { \fi:
12741     \cs_set:Npn \__tl_tmp:w ##1 #2 { }
12742     \tl_if_empty:oTF { \__tl_tmp:w #1 {} {} #2 }
12743     { \prg_return_false: } { \prg_return_true: }
12744     \if_false: } \fi:
12745   }
12746   \prg_generate_conditional_variant:Nnn \tl_if_in:nn
12747   { V , VV , o , oo , nV , no } { T , F , TF }

```

(End of definition for `\tl_if_in:nnTF`. This function is documented on page 116.)

`\tl_if_novalue_p:n` Tests whether ##1 matches -NoValue- exactly (with suitable catcodes): this is similar  
`\tl_if_novalue:nTF` to `\quark_if_nil:nTF`. The first argument of `\__tl_if_novalue:w` is empty if and  
`\__tl_if_novalue:w` only if ##1 starts with -NoValue-, while the second argument is empty if ##1 is exactly -NoValue- or if it has a question mark just following -NoValue-. In this second case, however, the material after the first ?! remains and makes the emptiness test return false.

```

12748 \cs_set_protected:Npn \__tl_tmp:w #1
12749 {
12750   \prg_new_conditional:Npnn \tl_if_novalue:n ##1
12751   { p , T , F , TF }
12752   {
12753     \__tl_if_empty_if:o { \__tl_if_novalue:w {} ##1 {} ? ! #1 ? ? ! }
12754     \prg_return_true:
12755     \else:
12756     \prg_return_false:
12757     \fi:
12758   }
12759   \cs_new:Npn \__tl_if_novalue:w ##1 #1 ##2 ? ##3 ? ! { ##1 ##2 }
12760 }
12761 \exp_args:No \__tl_tmp:w { \c_novalue_tl }

```

(End of definition for `\tl_if_novalue:nTF` and `\__tl_if_novalue:w`. This function is documented on page 116.)

`\tl_if_single_p:N` Expand the token list and feed it to `\tl_if_single:nTF`.  
`\tl_if_single_p:c` 12762 \cs\_new:Npn \tl\_if\_single\_p:N { \exp\_args:No \tl\_if\_single\_p:n }  
`\tl_if_single:nTF` 12763 \cs\_new:Npn \tl\_if\_single:NT { \exp\_args:No \tl\_if\_single:nT }  
`\tl_if_single:cTF` 12764 \cs\_new:Npn \tl\_if\_single:NF { \exp\_args:No \tl\_if\_single:nF }

```

12765 \cs_new:Npn \tl_if_single:NTF { \exp_args:No \tl_if_single:nTF }
12766 \prg_generate_conditional_variant:Nnn \tl_if_single:N {c} { p , T , F , TF }

```

(End of definition for `\tl_if_single:NTF`. This function is documented on page 116.)

`\tl_if_single_p:n`  
`\tl_if_single:nTF`  
`\__tl_if_single:nnw`

This test is similar to `\tl_if_empty:nTF`. Expanding `\use_none:nn #1 ??` once yields an empty result if `#1` is blank, a single `?` if `#1` has a single item, and otherwise yields some tokens ending with `??`. Then, `\__kernel_tl_to_str:w` makes sure there are no odd category codes. An earlier version would compare the result to a single `?` using string comparison, but the Lua call is slow in LuaTeX. Instead, `\__tl_if_single:nnw` picks the second token in front of it. If `#1` is empty, this token is the trailing `?` and the `\if:w` test yields `false`. If `#1` has a single item, the token is `\scan_stop:` and the `\if:w` test yields `true`. Otherwise, it is one of the characters resulting from `\tl_to_str:n`, and the `\if:w` test yields `false`. Note that `\if:w` and `\__kernel_tl_to_str:w` are primitives that take care of expansion.

```

12767 \prg_new_conditional:Npnn \tl_if_single:n #1 { p , T , F , TF }
12768 {
12769   \if:w \scan_stop: \exp_after:wN \__tl_if_single:nnw
12770     \__kernel_tl_to_str:w
12771     \exp_after:wN { \use_none:nn #1 ?? } \scan_stop: ? \s__tl_stop
12772   \prg_return_true:
12773   \else:
12774     \prg_return_false:
12775   \fi:
12776 }
12777 \cs_new:Npn \__tl_if_single:nnw #1#2#3 \s__tl_stop {#2}

```

(End of definition for `\tl_if_single:nTF` and `\__tl_if_single:nnw`. This function is documented on page 116.)

`\tl_if_single_token_p:n`  
`\tl_if_single_token:nTF`

There are four cases: empty token list, token list starting with a normal token, with a brace group, or with a space token. If the token list starts with a normal token, remove it and check for emptiness. For the next case, an empty token list is not a single token. Finally, we have a non-empty token list starting with a space or a brace group. Applying f-expansion yields an empty result if and only if the token list is a single space.

```

12778 \prg_new_conditional:Npnn \tl_if_single_token:n #1 { p , T , F , TF }
12779 {
12780   \tl_if_head_is_N_type:nTF {#1}
12781   { \__tl_if_empty_if:o { \use_none:n #1 } }
12782   {
12783     \tl_if_empty:nTF {#1}
12784     { \if_false: }
12785     { \__tl_if_empty_if:o { \exp:w \exp_end_continue_f:w #1 } }
12786   }
12787   \prg_return_true:
12788   \else:
12789     \prg_return_false:
12790   \fi:
12791 }

```

(End of definition for `\tl_if_single_token:nTF`. This function is documented on page 116.)

```

12805 { V } { TF , T , F }

```

(End of definition for `\tl_if_regex_match:nn` and `\tl_if_regex_match:nN`. These functions are documented on page ??.)

## 56.8 Mapping over token lists

`\tl_map_function:nN` Expandable loop macro for token lists. We use the internal scan mark `\s__tl_stop` (defined later), which is not allowed to show up in the token list #1 since it is internal to `l3tl`. This allows us a very fast test of whether some `<item>` is the end-marker `\s__tl_stop`, namely call `\__tl_use_none_delimit_by_s_stop:w <item> <function> \s__tl_stop`, which calls `<function>` if the `<item>` is the end-marker. To speed up the loop even more, only test one out of eight items, and once we hit one of the eight end-markers, go more slowly through the last few items of the list using `\__tl_map_function_end:w`.

```

12806 \cs_new:Npn \tl_map_function:nN #1#2
12807 {
12808     \__tl_map_function:Nnnnnnnnn #2 #1
12809     \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12810     \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12811     \prg_break_point:Nn \tl_map_break: { }
12812 }
12813 \cs_generate_variant:Nn \tl_map_function:nN { e }
12814 \cs_new:Npn \tl_map_function:NN
12815 { \exp_args:No \tl_map_function:nN }
12816 \cs_generate_variant:Nn \tl_map_function:NN { c }
12817 \cs_new:Npn \__tl_map_function:Nnnnnnnnn #1#2#3#4#5#6#7#8#9
12818 {
12819     \__tl_use_none_delimit_by_s_stop:w
12820     #9 \__tl_map_function_end:w \s__tl_stop
12821     #1 {#2} #1 {#3} #1 {#4} #1 {#5} #1 {#6} #1 {#7} #1 {#8} #1 {#9}
12822     \__tl_map_function:Nnnnnnnnn #1
12823 }
12824 \cs_new:Npn \__tl_map_function_end:w \s__tl_stop #1#2
12825 {
12826     \__tl_use_none_delimit_by_s_stop:w #2 \tl_map_break: \s__tl_stop
12827     #1 {#2}
12828     \__tl_map_function_end:w \s__tl_stop
12829 }
12830 \cs_new:Npn \__tl_use_none_delimit_by_s_stop:w #1 \s__tl_stop { }

```

(End of definition for `\tl_map_function:nN` and others. These functions are documented on page 122.)

`\tl_map_inline:nn` The inline functions are straight forward by now. We use a little trick with the counter  
`\tl_map_inline:Nn` `\g__kernel_prg_map_int` to make them nestable. We can also make use of `\__tl_-`  
`\tl_map_inline:cn` `map_function:Nnnnnnnnn` from before.

```

12831 \cs_new_protected:Npn \tl_map_inline:nn #1#2
12832 {
12833   \int_gincr:N \g__kernel_prg_map_int
12834   \cs_gset_protected:cpn
12835     { \__tl_map_ \int_use:N \g__kernel_prg_map_int :w } ##1 {#2}
12836   \exp_args:Nc \__tl_map_function:Nnnnnnnnn
12837     { \__tl_map_ \int_use:N \g__kernel_prg_map_int :w }
12838     #1
12839     \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12840     \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12841     \prg_break_point:Nn \tl_map_break:
12842     { \int_gdecr:N \g__kernel_prg_map_int }
12843 }
12844 \cs_new_protected:Npn \tl_map_inline:Nn
12845   { \exp_args:No \tl_map_inline:nn }
12846 \cs_generate_variant:Nn \tl_map_inline:Nn { c }

```

(End of definition for `\tl_map_inline:nn` and `\tl_map_inline:Nn`. These functions are documented on page 122.)

`\tl_map_tokens:nn` Much like the function mapping.

`\tl_map_tokens:Nn`

`\tl_map_tokens:cn`

`\__tl_map_tokens:nnnnnnnnnn`

`\__tl_map_tokens_end:w`

```

12847 \cs_new:Npn \tl_map_tokens:nn #1#2
12848 {
12849   \__tl_map_tokens:nnnnnnnnnn {#2} #1
12850   \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12851   \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12852   \prg_break_point:Nn \tl_map_break: { }
12853 }
12854 \cs_new:Npn \tl_map_tokens:Nn
12855   { \exp_args:No \tl_map_tokens:nn }
12856 \cs_generate_variant:Nn \tl_map_tokens:Nn { c }
12857 \cs_new:Npn \__tl_map_tokens:nnnnnnnnnn #1#2#3#4#5#6#7#8#9
12858 {
12859   \__tl_use_none_delimit_by_s_stop:w
12860   #9 \__tl_map_tokens_end:w \s__tl_stop
12861   \use:n {#1} {#2} \use:n {#1} {#3} \use:n {#1} {#4} \use:n {#1} {#5}
12862   \use:n {#1} {#6} \use:n {#1} {#7} \use:n {#1} {#8} \use:n {#1} {#9}
12863   \__tl_map_tokens:nnnnnnnnnn {#1}
12864 }
12865 \cs_new:Npn \__tl_map_tokens_end:w \s__tl_stop \use:n #1#2
12866 {
12867   \__tl_use_none_delimit_by_s_stop:w #2 \tl_map_break: \s__tl_stop
12868   #1 {#2}
12869   \__tl_map_tokens_end:w \s__tl_stop
12870 }

```

(End of definition for `\tl_map_tokens:nn` and others. These functions are documented on page 122.)

`\tl_map_variable:nNn` `\tl_map_variable:NNn` `\tl_map_variable:cNn` `\_tl_map_variable:Nnn` `\tl_map_variable:nNn`  $\langle token\ list \rangle$   $\langle tl\ var \rangle$   $\langle action \rangle$  assigns  $\langle tl\ var \rangle$  to each element and executes  $\langle action \rangle$ . The assignment to  $\langle tl\ var \rangle$  is done after the quark test so that this variable does not get set to a quark.

```

12871 \cs_new_protected:Npn \tl_map_variable:nNn #1#2#3
12872   { \tl_map_tokens:nn {#1} { \_tl_map_variable:Nnn #2 {#3} } }
12873 \cs_new_protected:Npn \_tl_map_variable:Nnn #1#2#3
12874   { \tl_set:Nn #1 {#3} #2 }
12875 \cs_new_protected:Npn \tl_map_variable:NNn
12876   { \exp_args:No \tl_map_variable:nNn }
12877 \cs_generate_variant:Nn \tl_map_variable:NNn { c }

```

(End of definition for `\tl_map_variable:nNn`, `\tl_map_variable:NNn`, and `\_tl_map_variable:Nnn`. These functions are documented on page 123.)

`\tl_map_break:` The break statements use the general `\prg_map_break:Nn`.  
`\tl_map_break:n`

```

12878 \cs_new:Npn \tl_map_break:
12879   { \prg_map_break:Nn \tl_map_break: { } }
12880 \cs_new:Npn \tl_map_break:n
12881   { \prg_map_break:Nn \tl_map_break: }

```

(End of definition for `\tl_map_break:` and `\tl_map_break:n`. These functions are documented on page 123.)

## 56.9 Using token lists

`\tl_to_str:n` Another name for a primitive: defined in `l3basics`.

```

12882 \cs_generate_variant:Nn \tl_to_str:n { o , V , v , e }

```

`\tl_to_str:o` `\tl_to_str:V` `\tl_to_str:v` (End of definition for `\tl_to_str:n`. This function is documented on page 118.)

`\tl_to_str:e` `\tl_to_str:N` These functions return the replacement text of a token list as a string.

```

12883 \cs_new:Npn \tl_to_str:N #1 { \_kernel_tl_to_str:w \exp_after:wN {#1} }
12884 \cs_generate_variant:Nn \tl_to_str:N { c }

```

(End of definition for `\tl_to_str:N`. This function is documented on page 119.)

`\tl_use:N` Token lists which are simply not defined give a clear T<sub>E</sub>X error here. No such luck for  
`\tl_use:c` ones equal to `\scan_stop:` so instead a test is made and if there is an issue an error is forced.

```

12885 \cs_new:Npn \tl_use:N #1
12886   {
12887     \tl_if_exist:NTF #1 {#1}
12888     {
12889       \msg_expandable_error:nnn
12890         { kernel } { bad-variable } {#1}
12891     }
12892   }
12893 \cs_generate_variant:Nn \tl_use:N { c }

```

(End of definition for `\tl_use:N`. This function is documented on page 119.)

## 56.10 Working with the contents of token lists

**\tl\_count:n** Count number of elements within a token list or token list variable. Brace groups within the list are read as a single element. Spaces are ignored. **\\_\_tl\_count:n** grabs the element and replaces it by +1. The 0 ensures that it works on an empty list.

```

\tl_count:V 12894 \cs_new:Npn \tl_count:n #1
\tl_count:v 12895 {
\tl_count:e 12896   \int_eval:n
\tl_count:o 12897   { 0 \tl_map_function:nN {#1} \__tl_count:n }
\tl_count:N 12898 }
\tl_count:c 12899 \cs_new:Npn \tl_count:N #1
\__tl_count:n 12900 {
12901   \int_eval:n
12902   { 0 \tl_map_function:NN #1 \__tl_count:n }
12903 }
12904 \cs_new:Npn \__tl_count:n #1 { + 1 }
12905 \cs_generate_variant:Nn \tl_count:n { V , v , e , o }
12906 \cs_generate_variant:Nn \tl_count:N { c }

```

(End of definition for **\tl\_count:n**, **\tl\_count:N**, and **\\_\_tl\_count:n**. These functions are documented on page 119.)

**\tl\_count\_tokens:n** The token count is computed through an **\int\_eval:n** construction. Each 1+ is output to the *left*, into the integer expression, and the sum is ended by the **\exp\_end:** inserted by **\\_\_tl\_act\_end:wn** (which is technically implemented as **\c\_zero\_int**). Somewhat a hack!

```

12907 \cs_new:Npn \tl_count_tokens:n #1
12908 {
12909   \int_eval:n
12910   {
12911     \__tl_act:NNNn
12912     \__tl_act_count_normal:N
12913     \__tl_act_count_group:n
12914     \__tl_act_count_space:
12915     {#1}
12916   }
12917 }
12918 \cs_new:Npn \__tl_act_count_normal:N #1 { 1 + }
12919 \cs_new:Npn \__tl_act_count_space: { 1 + }
12920 \cs_new:Npn \__tl_act_count_group:n #1 { 2 + \tl_count_tokens:n {#1} + }

```

(End of definition for **\tl\_count\_tokens:n** and others. This function is documented on page 119.)

**\tl\_reverse\_items:n** Reversal of a token list is done by taking one item at a time and putting it after **\s\_\_tl\_stop**.

```

\__tl_reverse_items:nwNwn 12921 \cs_new:Npn \tl_reverse_items:n #1
\__tl_reverse_items:wn 12922 {
12923   \__tl_reverse_items:nwNwn #1 ?
12924   \s__tl_mark \__tl_reverse_items:nwNwn
12925   \s__tl_mark \__tl_reverse_items:wn
12926   \s__tl_stop { }
12927 }
12928 \cs_new:Npn \__tl_reverse_items:nwNwn #1 #2 \s__tl_mark #3 #4 \s__tl_stop #5
12929 {

```

```

12930      #3 #2
12931      \s__tl_mark \__tl_reverse_items:nwNwn
12932      \s__tl_mark \__tl_reverse_items:wn
12933      \s__tl_stop { {#1} #5 }
12934    }
12935    \cs_new:Npn \__tl_reverse_items:wn #1 \s__tl_stop #2
12936    { \__kernel_exp_not:w \exp_after:wN { \use_none:nn #2 } }

```

(End of definition for `\tl_reverse_items:n`, `\__tl_reverse_items:nwNwn`, and `\__tl_reverse_items:wn`. This function is documented on page 120.)

`\tl_trim_spaces:n` Trimming spaces from around the input is deferred to an internal function whose first argument is the token list to trim, and whose second argument is a *<continuation>*, which receives as a braced argument `\__tl_trim_mark: <trimmed token list>`. The control sequence `\__tl_trim_mark:` expands to nothing in a single expansion. In the case at hand, we take `\__kernel_exp_not:w \exp_after:wN` as our continuation, so that space trimming behaves correctly within an e-type or x-type expansion.

```

Trimming spaces from around the input is done using delimited arguments and `\__tl_trim_spaces:nn`, and to get spaces at odd places in the definitions, we nest those in `\__tl_tmp:w`, which then receives a single space as its argument: `#1` is `␣`. Removing leading spaces is done with `\__tl_trim_spaces_auxi:w`, which loops until `\__tl_trim_mark:␣` matches the end of the token list: then `##1` is the token list and `##3` is `\__tl_trim_spaces_auxii:w`. This hands the relevant tokens to the loop `\__tl_trim_spaces_auxiii:w`, responsible for trimming trailing spaces. The end is reached when `␣\s__tl_nil` matches the one present in the definition of `\tl_trim_spaces:n`. Then `\__tl_trim_spaces_auxiv:w` puts the token list into a group, with a lingering `\__tl_trim_mark:` at the start (which will expand to nothing in one step of expansion), and feeds this to the *<continuation>*.

Trimming just leading spaces (see `\__tl_trim_left_spaces:nn`) also starts with `\__tl_trim_spaces_auxi:w`, but when it loops until `\__tl_trim_mark:␣` matches the end of the token list, `##1` is the token list *but* `##3` is `\__tl_trim_spaces_auxv:w`. Like `\__tl_trim_spaces_auxiv:w`, this directly hands the relevant tokens to the exit *<continuation>*. Trimming just trailing spaces (see `\__tl_trim_right_spaces:nn`) starts with the (second) loop `\__tl_trim_spaces_auxiii:w`.

`\tl_sort:nN`

## 56.11 The first token from a token list

`\tl_head:N` Finding the head of a token list expandably always strips braces, which is fine as this is consistent with for example mapping over a list. The empty brace groups in `\tl_head:n` ensure that a blank argument gives an empty result. The result is returned within the `\unexpanded` primitive. The approach here is to use `\if_false:` to allow us to use `}` as the closing delimiter: this is the only safe choice, as any other token would not be able to parse its own code. More detail in <http://tex.stackexchange.com/a/70168>.

```

\__tl_head_auxi:nw 13026 \cs_new:Npn \tl_head:n #1
\__tl_head_auxii:n 13027 {
\__tl_head:w 13028   \tl_head:w
\__tl_head:w 13029   \__kernel_exp_not:w \tex_expanded:D
\__tl_head:w 13029   { { \if_false: { \fi: \__tl_head_aux:n #1 { } } } }
\__tl_head:w 13030 }
\__tl_head:w 13031 \cs_new:Npn \tl_head:n #1
\__tl_head:w 13032 {
\__tl_head:w 13033   \__kernel_exp_not:w {#1}
\__tl_head:w 13034   \exp_after:wN \use_none:n \exp_after:wN { \if_false: } \fi:
\__tl_head:w 13035 }
\__tl_head:w 13036 \cs_generate_variant:Nn \tl_head:n { V , v , f , e }
\__tl_head:w 13037 \cs_new:Npn \tl_head:w #1#2 \q_stop {#1}
\__tl_head:w 13038 \cs_new:Npn \tl_head:w #1#2 \s__tl_stop {#1}
\__tl_head:w 13039 \cs_new:Npn \tl_head:N { \exp_args:No \tl_head:n }

```

To correctly leave the tail of a token list, it's important *not* to absorb any of the tail part as an argument. For example, the simple definition

```

\cs_new:Npn \tl_tail:n #1 { \tl_tail:w #1 \q_stop }
\cs_new:Npn \tl_tail:w #1#2 \q_stop

```

would give the wrong result for `\tl_tail:n { a { bc } }` (the braces would be stripped). Thus the only safe way to proceed is to first check that there is an item to grab (i.e., that the argument is not blank) and assuming there is to dispose of the first item. As with `\tl_head:n`, the result is protected from further expansion by `\unexpanded`. While we could optimise the test here, this would leave some tokens “banned” in the input, which we do not have with this definition.

```

13040 \exp_args:Nno \use:n { \cs_new:Npn \tl_tail:n #1 }
13041 {
13042   \exp_after:wN \__kernel_exp_not:w
13043   \tl_if_blank:nTF {#1}
13044     { { } }
13045     { \exp_after:wN { \use_none:n #1 } }
13046 }
13047 \cs_generate_variant:Nn \tl_tail:n { V , v , f , e }
13048 \cs_new:Npn \tl_tail:N { \exp_args:No \tl_tail:n }

```

  \__tl_head_exp_not:w
  \__tl_if_head_eq_empty_arg:w

```

Accessing the first token of a token list is tricky in three cases: when it has category code 1 (begin-group token), when it is an explicit space, with category code 10 and character code 32, or when the token list is empty (obviously).

Forgetting temporarily about this issue we would use the following test in `\tl_if_head_eq_charcode:nN`. Here, `\tl_head:w` yields the first token of the token list, then passed to `\exp_not:N`.

```

\tl_if_head_eq_charcode:nN
\tl_if_head_eq_charcode_p:nN
\tl_if_head_eq_charcode_p:VN
\tl_if_head_eq_charcode_p:eN
\tl_if_head_eq_charcode_p:fN
\tl_if_head_eq_charcode:nNTF
\tl_if_head_eq_charcode:VNTF
\tl_if_head_eq_charcode:eNTF
\tl_if_head_eq_charcode:fNTF
\tl_if_head_eq_catcode_p:nN
\tl_if_head_eq_catcode_p:VN
\tl_if_head_eq_catcode_p:eN
\tl_if_head_eq_catcode_p:oN
\tl_if_head_eq_catcode:nNTF
\tl_if_head_eq_catcode:VNTF
\tl_if_head_eq_catcode:eNTF
\tl_if_head_eq_catcode:oNTF
  \__tl_head_exp_not:w
  \__tl_if_head_eq_empty_arg:w

```

The two first special cases are detected by testing if the token list starts with an N-type token (the extra ? sends empty token lists to the `true` branch of this test). In those cases, the first token is a character, and since we only care about its character code, we can use `\str_head:n` to access it (this works even if it is a space character). An empty argument results in `\tl_head:w` leaving two tokens: `^` and `\__tl_if_head_eq_empty_arg:w` which will result in the `\if_charcode:w` test being false and remove `\exp_not:N` and `#2`.

```

13049 \prg_new_conditional:Npnn \tl_if_head_eq_charcode:nN #1#2 { p , T , F , TF }
13050 {
13051   \if_charcode:w
13052     \tl_if_head_is_N_type:nTF { #1 ? }
13053     { \__tl_head_exp_not:w #1 { ^ \__tl_if_head_eq_empty_arg:w } \s__tl_stop }
13054     { \str_head:n {#1} }
13055     \exp_not:N #2
13056     \prg_return_true:
13057   \else:
13058     \prg_return_false:
13059   \fi:
13060 }
13061 \prg_generate_conditional_variant:Nnn \tl_if_head_eq_charcode:nN
13062 { V , e , f } { p , TF , T , F }

```

For `\tl_if_head_eq_catcode:nN`, again we detect special cases with a `\tl_if_head_is_N_type:n`. Then we need to test if the first token is a begin-group token or an explicit space token, and produce the relevant token, either `\c_group_begin_token` or

`\c_space_token`. Again, for an empty argument, a hack is used, removing the token given by the user and leaving two tokens in the input stream which will make the `\if_catcode:w` test return false.

```

13063 \prg_new_conditional:Npnn \tl_if_head_eq_catcode:nN #1 #2 { p , T , F , TF }
13064 {
13065   \if_catcode:w
13066     \tl_if_head_is_N_type:nTF { #1 ? }
13067     { \__tl_head_exp_not:w #1 { ^ \__tl_if_head_eq_empty_arg:w } \s__tl_stop }
13068     {
13069       \tl_if_head_is_group:nTF {#1}
13070       \c_group_begin_token
13071       \c_space_token
13072     }
13073     \exp_not:N #2
13074     \prg_return_true:
13075   \else:
13076     \prg_return_false:
13077   \fi:
13078 }
13079 \prg_generate_conditional_variant:Nnn \tl_if_head_eq_catcode:nN
13080 { V , e , o } { p , TF , T , F }

```

For `\tl_if_head_eq_meaning:nN`, again, detect special cases. In the normal case, use `\tl_head:w`, with no `\exp_not:N` this time, since `\if_meaning:w` causes no expansion. With an empty argument, the test is true, and `\use_none:nnn` removes #2 and `\prg_return_true:` and `\else:` (it is safe this way here as in this case `\prg_new_conditional:Npnn` didn't optimize these two away). In the special cases, we know that the first token is a character, hence `\if_charcode:w` and `\if_catcode:w` together are enough. We combine them in some order, hopefully faster than the reverse. Tests are not nested because the arguments may contain unmatched primitive conditionals.

```

13081 \prg_new_conditional:Npnn \tl_if_head_eq_meaning:nN #1#2 { p , T , F , TF }
13082 {
13083   \tl_if_head_is_N_type:nTF { #1 ? }

13116 }
13117 }

```

Both `\tl_if_head_eq_charcode:nN` and `\tl_if_head_eq_catcode:nN` will need to get the first token of their argument and apply `\exp_not:N` to it. `\__tl_head_exp_not:w` does exactly that.

```

13118 \cs_new:Npn \__tl_head_exp_not:w #1 #2 \s__tl_stop
13119 { \exp_not:N #1 }

```

If the argument of `\tl_if_head_eq_charcode:nN` and `\tl_if_head_eq_catcode:nN` was empty `\__tl_if_head_eq_empty_arg:w` will be left in the input stream. This macro has to remove `\exp_not:N` and the following token from the input stream to make sure no unbalanced if-construct is created and leave tokens there which make the two tests return false.

```

13120 \cs_new:Npn \__tl_if_head_eq_empty_arg:w \exp_not:N #1
13121 { ? }

```

*(End of definition for `\tl_if_head_eq_meaning:nNTF` and others. These functions are documented on page 117.)*

```

\tl_if_head_is_N_type_p:n
\tl_if_head_is_N_type:nTF
  \__tl_if_head_is_N_type_auxi:w
  \__tl_if_head_is_N_type_auxii:n

```

A token list can be empty, can start with an explicit space character (catcode 10 and charcode 32), can start with a begin-group token (catcode 1), or start with an N-type argument. In the first two cases, and when `#1~` starts with `{}`~, `\__tl_if_head_is_N_type_auxi:w` receives an empty argument hence produces `f` and removes everything before the first `\scan_stop:.` In the third case (except when `#1~` starts with `{}`~), the second auxiliary removes the first copy of `#1` that was used for the space test, then expands `\token_to_str:N` which hits the leading begin-group token, leaving a single closing brace to be compared with `\scan_stop:.` In the last case, `\token_to_str:N` does not change the brace balance so that only `\scan_stop: \scan_stop:` remain, making the character code test true. One cannot optimize by moving one of the `\scan_stop:` to the beginning: if `#1` contains primitive conditionals, all of its occurrences must be dealt with before the `\if:w` tries to skip the true branch of the conditional.

```

13122 \prg_new_conditional:Npnn \tl_if_head_is_N_type:n #1 { p , T , F , TF }
13123 {
13124     \if:w

`\tl_if_head_is_group_p:n` Pass the first token of #1 through `\token_to_str:N`, then check for the brace balance.  
`\tl_if_head_is_group:nTF` The extra ? caters for an empty argument. This could be made faster, but we need all  
`\__tl_if_head_is_group_fi_false:w` brace tricks to happen in one step of expansion, keeping the token list brace balanced at all times.

```

13142 \prg_new_conditional:Npnn \tl_if_head_is_group:n #1 { p , T , F , TF }
13143 {

13154   \fi:
13155 }
13156 \cs_new:Npn \__tl_if_head_is_group_fi_false:w \fi: \if_true: { \fi: \if_false: }

```

(End of definition for `\tl_if_head_is_group:nTF` and `\__tl_if_head_is_group_fi_false:w`. This function is documented on page 117.)

`\tl_if_head_is_space_p:n` The auxiliary's argument is all that is before the first explicit space in `\prg_do_nothing:#1?~`.  
`\tl_if_head_is_space:nTF` If that is a single `\prg_do_nothing:` the test yields true. Otherwise, that is more  
`\__tl_if_head_is_space:w` than one token, and the test yields false. The work is done within braces (with an `\if_false: { \fi: ... }` construction) both to hide potential alignment tab characters from TeX in a table, and to allow for removing what remains of the token list after its first space. The use of `\if:w` ensures that the result of a single step of expansion directly yields a balanced token list (no trailing closing brace).

```

13157 \prg_new_conditional:Npnn \tl_if_head_is_space:n #1 { p , T , F , TF }
13158 {
13159   \if:w

13171 }

```

(End of definition for `\tl_if_head_is_space:nTF` and `\__tl_if_head_is_space:w`. This function is documented on page 118.)

## 56.12 Token by token changes

`\s__tl_act_stop` The `\__tl_act...` functions may be applied to any token list. Hence, we use a private quark, to allow any token, even quarks, in the token list. Only `\s__tl_act_stop` may not appear in the token lists manipulated by `\__tl_act:NNNn` functions.

```

13172 \scan_new:N \s__tl_act_stop

```

(End of definition for `\s__tl_act_stop`.)

```

\__tl_act:NNNn To help control the expansion, \__tl_act:NNNn should always be preceded by \exp:w
\__tl_act_output:n and ends by producing \exp_end: once the result has been obtained. This way no internal
\__tl_act_reverse_output:n token of it can be accidentally end up in the input stream. Because \s__tl_act_stop
\__tl_act_loop:w can't appear without braces around it in the argument #1 of \__tl_act_loop:w, we can
\__tl_act_normal:NwNNN use this marker to set up a fast test for leading spaces.
\__tl_act_group:nwNNN
\__tl_act_space:wwNNN
\__tl_act_end:wn
\__tl_act_if_head_is_space:nTF
\__tl_act_if_head_is_space:w
\__tl_act_if_head_is_space_true:w
\__tl_use_none_delimit_by_q_act_stop:w

```

```

13173 \cs_set_protected:Npn \__tl_tmp:w #1

13175   \cs_new:Npn \__tl_act_if_head_is_space:nTF ##1
13176   {
13177     \__tl_act_if_head_is_space:w
13178     \s__tl_act_stop ##1 \s__tl_act_stop \__tl_act_if_head_is_space_true:w
13179     \s__tl_act_stop #1 \s__tl_act_stop \use_ii:nn
13180   }
13181   \cs_new:Npn \__tl_act_if_head_is_space:w
13182   ##1 \s__tl_act_stop #1 ##2 \s__tl_act_stop
13183   {}
13184   \cs_new:Npn \__tl_act_if_head_is_space_true:w
13185   \s__tl_act_stop #1 \s__tl_act_stop \use_ii:nn ##1 ##2
13186   {##1}
13187 }
13188 \__tl_tmp:w { ~ }

```

(We expand the definition `\__tl_act_if_head_is_space:nTF` when setting up `\__tl_act_loop:w`, so we can then undefine the auxiliary.) In the loop, we check how the token list begins and act accordingly. In the “group” case, we may have reached `\s__tl_act_stop`, the end of the list. Then leave `\exp_end:` and the result in the input stream, to terminate the expansion of `\exp:w`. Otherwise, apply the relevant function to the “arguments”, #3 and to the head of the token list. Then repeat the loop. The scheme is the same if the token list starts with an N-type or with a space, making sure that `\__tl_act_space:wwNNN` gobbles the space.

```

13189 \exp_args:Nne \use:n { \cs_new:Npn \__tl_act_loop:w #1 \s__tl_act_stop }

13221     \__tl_act_loop:w #1 \s__tl_act_stop
13222     #2 #3
13223 }

```

\\_\_tl\_act:NNNn loops over tokens, groups, and spaces in #4. {\s\_@@\_act\_stop} serves as the end of token list marker, the ? after it avoids losing outer braces. The result is stored as an argument for the dummy function \\_\_tl\_act\_result:n.

```

13224 \cs_new:Npn \__tl_act:NNNn #1#2#3#4
13225 {
13226     \group_align_safe_begin:
13227     \__tl_act_loop:w #4 { \s__tl_act_stop } ? \s__tl_act_stop
13228     #1 #3 #2
13229     \__tl_act_result:n { }
13230 }

```

Typically, the output is done to the right of what was already output, using \\_\_tl\_act\_output:n, but for the \\_\_tl\_act\_reverse functions, it should be done to the left.

```

13231 \cs_new:Npn \__tl_act_output:n #1 #2 \__tl_act_result:n #3
13232 { #2 \__tl_act_result:n { #3 #1 } }
13233 \cs_new:Npn \__tl_act_reverse_output:n #1 #2 \__tl_act_result:n #3
13234 { #2 \__tl_act_result:n { #1 #3 } }

```

(End of definition for \\_\_tl\_act:NNNn and others.)

**\tl\_reverse:n** The goal here is to reverse without losing spaces nor braces. This is done using the  
**\tl\_reverse:o** general internal function \\_\_tl\_act:NNNn. Spaces and “normal” tokens are output on  
**\tl\_reverse:V** the left of the current output. Grouped tokens are output to the left but without any  
**\tl\_reverse:f** reversal within the group.  
**\tl\_reverse:e**

```

\__tl_reverse_normal:nN
\__tl_reverse_group_preserve:nn
\__tl_reverse_space:n

```

```

13235 \cs_new:Npn \tl_reverse:n #1
13236 {
13237   \__kernel_exp_not:w \exp_after:wN
13238   {
13239     \exp:w
13240     \__tl_act:NNNn
13241     \__tl_reverse_normal:N
13242     \__tl_reverse_group_preserve:n
13243     \__tl_reverse_space:
13244     {#1}
13245   }
13246 }
13247 \cs_generate_variant:Nn \tl_reverse:n { o , V , f , e }
13248 \cs_new:Npn \__tl_reverse_normal:N
13249 { \__tl_act_reverse_output:n }
13250 \cs_new:Npn \__tl_reverse_group_preserve:n #1
13251 { \__tl_act_reverse_output:n { {#1} } }
13252 \cs_new:Npn \__tl_reverse_space:
13253 { \__tl_act_reverse_output:n { ~ } }

```

(End of definition for `\tl_reverse:n` and others. This function is documented on page 119.)

**`\tl_reverse:N`** This reverses the list, leaving `\exp_stop_f:` in front, which stops the f-expansion.

```

\tl_reverse:c 13254 \cs_new_protected:Npn \tl_reverse:N #1
\tl_greverse:N 13255 { \__kernel_tl_set:Nx #1 { \exp_args:No \tl_reverse:n { #1 } } }
\tl_greverse:c 13256 \cs_new_protected:Npn \tl_greverse:N #1
13257 { \__kernel_tl_gset:Nx #1 { \exp_args:No \tl_reverse:n { #1 } } }
13258 \cs_generate_variant:Nn \tl_reverse:N { c }
13259 \cs_generate_variant:Nn \tl_greverse:N { c }

```

(End of definition for `\tl_reverse:N` and `\tl_greverse:N`. These functions are documented on page 120.)

## 56.13 Using a single item

**`\tl_item:nn`** The idea here is to find the offset of the item from the left, then use a loop to grab the correct item. If the resulting offset is too large, then `\__tl_if_recursion_tail_break:nN` terminates the loop, and returns nothing at all.

```

\tl_item:cn 13260 \cs_new:Npn \tl_item:nn #1#2
\tl_item:nn 13261 {
13262   \exp_args:Nf \__tl_item:nn
13263   { \exp_args:Nf \__tl_item_aux:nn { \int_eval:n {#2} } {#1} }
13264   #1
13265   \q__tl_recursion_tail
13266   \prg_break_point:
13267 }
13268 \cs_new:Npn \__tl_item_aux:nn #1#2
13269 {
13270   \int_compare:nNnTF {#1} < 0
13271   { \int_eval:n { \tl_count:n {#2} + 1 + #1 } }
13272   {#1}
13273 }
13274 \cs_new:Npn \__tl_item:nn #1#2

```

```

13275 {
13276   \__tl_if_recursion_tail_break:nN {#2} \prg_break:
13277   \int_compare:nNnTF {#1} = 1
13278     { \prg_break:n { \exp_not:n {#2} } }
13279     { \exp_args:Nf \__tl_item:nn { \int_eval:n { #1 - 1 } } }
13280 }
13281 \cs_new:Npn \tl_item:Nn { \exp_args:No \tl_item:nn }
13282 \cs_generate_variant:Nn \tl_item:Nn { c }

```

(End of definition for `\tl_item:nn` and others. These functions are documented on page 125.)

`\tl_rand_item:n` Importantly `\tl_item:nn` only evaluates its argument once.

```

\__tl_rand_item:Nn 13283 \cs_new:Npn \tl_rand_item:n #1
\__tl_rand_item:Nn 13284 {
\__tl_rand_item:Nn 13285   \tl_if_blank:nF {#1}
\__tl_rand_item:Nn 13286     { \tl_item:nn {#1} { \int_rand:nn { 1 } { \tl_count:n {#1} } } }
\__tl_rand_item:Nn 13287   }
\__tl_rand_item:Nn 13288 \cs_new:Npn \tl_rand_item:N { \exp_args:No \tl_rand_item:n }
\__tl_rand_item:Nn 13289 \cs_generate_variant:Nn \tl_rand_item:N { c }

```

(End of definition for `\tl_rand_item:n` and `\tl_rand_item:N`. These functions are documented on page 126.)

`\__kernel_int_sep:` See comments in the kernel functions file: has to be set up here as this is the first module where it is needed.

```

13290 \cs_new_eq:NN \__kernel_int_sep: \tex_right:D

```

(End of definition for `\__kernel_int_sep:.`)

`\__tl_sep:`

```

13291 \cs_new_eq:NN \__tl_sep: \__kernel_int_sep:

```

(End of definition for `\__tl_sep:.`)

`\tl_range:Nnn` To avoid checking for the end of the token list at every step, start by counting the number  
`\tl_range:cnn`  $l$  of items and “normalizing” the bounds, namely clamping them to the interval  $[0, l]$  and  
`\tl_range:nnn` dealing with negative indices. More precisely, `\__tl_range_items:nnNn` receives the  
`\__tl_range:Nnnn` number of items to skip at the beginning of the token list, the index of the last item  
`\__tl_range:nnnNn` to keep, a function which is either `\__tl_range:w` or the token list itself. If nothing  
`\__tl_range:nnNn` should be kept, leave `{}`: this stops the `f`-expansion of `\tl_head:f` and that function  
`\__tl_range_skip:w` produces an empty result. Otherwise, repeatedly call `\__tl_range_skip:w` to delete `#1`  
`\__tl_range:w` items from the input stream (the extra brace group avoids an off-by-one shift). For the  
`\__tl_range_skip_spaces:n` braced version `\__tl_range_braced:w` sets up `\__tl_range_collect_braced:w` which  
`\__tl_range_collect:nn` stores items one by one in an argument after the `\__tl_sep:.` Depending on the first  
`\__tl_range_collect:ff` token of the tail, either just move it (if it is a space) or also decrement the number of  
`\__tl_range_collect_space:nw` items left to find. Eventually, the result is a brace group followed by the rest of the token  
`\__tl_range_collect_N:nN` list, and `\tl_head:f` cleans up and gives the result in `\exp_not:n`.  
`\__tl_range_collect_group:nN`

13364     }
13365 }
13366 }
13367 \cs_new:Npn \_tl_range_collect_space:nw #1 ~ { { #1 ~ } }
13368 \cs_new:Npn \_tl_range_collect_N:nN #1#2 { { #1 #2 } }
13369 \cs_new:Npn \_tl_range_collect_group:nn #1#2 { { #1 {#2} } }
13370 \cs_generate_variant:Nn \_tl_range_collect:nn { ff }

```

(End of definition for `\tl_range:Nnn` and others. These functions are documented on page 127.)

`\_tl_range_normalize:nn` This function converts an  $\langle index \rangle$  argument into an explicit position in the token list (a result of 0 denoting “out of bounds”). Expects two explicit integer arguments: the  $\langle index \rangle$  #1 and the string count #2. If #1 is negative, replace it by #1 + #2 + 1, then limit to the range [0, #2].

```

13371 \cs_new:Npn \_tl_range_normalize:nn #1#2
13372 {
13373     \int_eval:n
13374     {
13375         \if_int_compare:w #1 < \c_zero_int
13376         \if_int_compare:w #1 < -#2 \exp_stop_f:
13377             0
13378         \else:
13379             #1 + #2 + 1
13380         \fi:
13381     \else:
13382         \if_int_compare:w #1 < #2 \exp_stop_f:
13383             #1
13384         \else:
13385             #2
13386         \fi:
13387     \fi:
13388 }
13389 }

```

(End of definition for `\_tl_range_normalize:nn`.)

## 56.14 Viewing token lists

`\tl_show:N` Showing token list variables is done after checking that the variable is defined (see `\_kernel_register_show:N`).

`\tl_log:N` `\tl_log:c` `\_tl_show:NN` `\tl_show:n` `\cs_new_protected:Npn` `\tl_show:N` `\_tl_show:NN` `\tl_show:n` `\cs_generate_variant:Nn` `\tl_show:N` `c`

```

13392 \cs_new_protected:Npn \tl_log:N { \__tl_show:NN \tl_log:n }
13393 \cs_generate_variant:Nn \tl_log:N { c }
13394 \cs_new_protected:Npn \__tl_show:NN #1#2
13395 {
13396   \__kernel_chk_defined:NT #2
13397   {
13398     \exp_args:Nf \tl_if_empty:nTF
13399       { \cs_prefix_spec:N #2 \cs_parameter_spec:N #2 }
13400       {
13401         \exp_args:Ne #1
13402         { \token_to_str:N #2 = \__kernel_exp_not:w \exp_after:wN {#2} }
13403       }
13404       {
13405         \msg_error:nneee { kernel } { bad-type }
13406         { \token_to_str:N #2 } { \token_to_meaning:N #2 } { tl }
13407       }
13408   }
13409 }

```

(End of definition for `\tl_show:N`, `\tl_log:N`, and `\__tl_show:NN`. These functions are documented on page 121.)

**`\tl_show:n`** Many show functions are based on `\tl_show:n`. The argument of `\tl_show:n` is line-wrapped using `\iow_wrap:nnnN` but with a leading `>~` and trailing period, both removed before passing the wrapped text to the `\showtokens` primitive. This primitive shows the result with a leading `>~` and trailing period.

**`\tl_show:e`** The token list `\l__tl_tmpa_tl` containing the result of all these manipulations is displayed to the terminal using `\tex_showtokens:D` and an odd `\exp_after:wN` which expand the closing brace to improve the output slightly. The calls to `\__kernel_iow_with:Nnn` ensure that the `\newlinechar` is set to 10 so that the `\iow_newline:` inserted by the line-wrapping code are correctly recognized by T<sub>E</sub>X, and that `\errorcontextlines` is `-1` to avoid printing irrelevant context.

```

13410 \cs_new_protected:Npn \tl_show:n #1
13411 { \iow_wrap:nnnN { >~ \tl_to_str:n {#1} . } { } { } \__tl_show:n }
13412 \cs_generate_variant:Nn \tl_show:n { e , x }
13413 \cs_new_protected:Npn \__tl_show:n #1
13414 {
13415   \tl_set:Nf \l__tl_tmpa_tl { \__tl_show:w #1 \s__tl_stop }
13416   \__kernel_iow_with:Nnn \tex_newlinechar:D { 10 }
13417   {
13418     \__kernel_iow_with:Nnn \tex_errorcontextlines:D { -1 }
13419     {
13420       \tex_showtokens:D \exp_after:wN \exp_after:wN \exp_after:wN
13421       { \exp_after:wN \l__tl_tmpa_tl }
13422     }
13423   }
13424 }
13425 \cs_new:Npn \__tl_show:w #1 > #2 . \s__tl_stop {#2}

```

(End of definition for `\tl_show:n`, `\__tl_show:n`, and `\__tl_show:w`. This function is documented on page 121.)

**`\tl_log:n`** Logging is much easier, simply line-wrap. The `>~` and trailing period is there to match the output of `\tl_show:n`.

**`\tl_log:e`**

**`\tl_log:x`**

```

13426 \cs_new_protected:Npn \tl_log:n #1
13427 { \iow_wrap:nnnN { > ~ \tl_to_str:n {#1} . } { } { } \iow_log:n }
13428 \cs_generate_variant:Nn \tl_log:n { e , x }

```

(End of definition for `\tl_log:n`. This function is documented on page 122.)

`\__kernel_chk_tl_type:NnnT` Helper for checking that #1 has the correct internal structure to be of a certain type. Make sure that it is defined and that it is a token list, namely a macro with no `\long` nor `\protected` prefix. Then compare #1 to an attempt at reconstructing a valid structure of the given type using #2 (see implementation of `\seq_show:N` for instance). If that is successful run the requested code #4.

```

13429 \cs_new_protected:Npn \__kernel_chk_tl_type:NnnT #1#2#3#4
13430 {
13431   \__kernel_chk_defined:NT #1
13432   {
13433     \exp_args:Nf \tl_if_empty:nTF
13434       { \cs_prefix_spec:N #1 \cs_parameter_spec:N #1 }
13435       {
13436         \tl_set:Ne \l__tl_tpa_tl {#3}
13437         \tl_if_eq:NNTF #1 \l__tl_tpa_tl
13438           {#4}
13439           {
13440             \msg_error:nneeee { kernel } { bad-type }
13441             { \token_to_str:N #1 } { \tl_to_str:N #1 }
13442             {#2} { \tl_to_str:N \l__tl_tpa_tl }
13443           }
13444       }
13445       {
13446         \msg_error:nneeee { kernel } { bad-type }
13447         { \token_to_str:N #1 } { \token_to_meaning:N #1 } {#2}
13448       }
13449   }
13450 }

```

(End of definition for `\__kernel_chk_tl_type:NnnT`.)

## 56.15 Internal scan marks

`\s__tl_nil` Internal scan marks. These are defined here at the end because the code for `\scan_new:N` depends on some `|3tl` functions.

```

\s__tl_mark
\s__tl_stop
13451 \scan_new:N \s__tl_nil
13452 \scan_new:N \s__tl_mark
13453 \scan_new:N \s__tl_stop

```

(End of definition for `\s__tl_nil`, `\s__tl_mark`, and `\s__tl_stop`.)

## 56.16 Scratch token lists

`\g_tmpa_tl` Global temporary token list variables. They are supposed to be set and used immediately, with no delay between the definition and the use because you can't count on other macros not to redefine them from under you.

```

13454 \tl_new:N \g_tmpa_tl
13455 \tl_new:N \g_tmpb_tl

```

*(End of definition for `\g_tmpa_tl` and `\g_tmpb_tl`. These variables are documented on page 132.)*

`\l_tmpa_tl` These are local temporary token list variables. Be sure not to assume that the value you  
`\l_tmpb_tl` put into them will survive for long—see discussion above.

```
13456 \tl_new:N \l_tmpa_tl
```

```
13457 \tl_new:N \l_tmpb_tl
```

*(End of definition for `\l_tmpa_tl` and `\l_tmpb_tl`. These variables are documented on page 131.)*

We finally clean up a temporary control sequence that we have used at various points to set up some definitions.

```
13458 \cs_undefine:N \__tl_tmp:w
```

```
13459 \code
```

## Chapter 57

# l3tl-build implementation

```
13460 <*code>
```

```
13461 <@@=tl>
```

Between `\tl_build_begin:N <tl var>` and `\tl_build_end:N <tl var>`, the `<tl var>` has the structure

```
\exp_end: ... \exp_end: \_tl_build_last:NNn <assignment> <next tl>
{<left>} <right>
```

where `<right>` is not braced. The “data” it represents is `<left>` followed by the “data” of `<next tl>` followed by `<right>`. The `<next tl>` is a token list variable whose name is that of `<tl var>` followed by `'`. There are between 0 and 4 `\exp_end:` to keep track of when `<left>` and `<right>` should be put into the `<next tl>`. The `<assignment>` is `\cs_set_nopar:Npe` if the variable is local, and `\cs_gset_nopar:Npe` if it is global.

```
\tl_build_begin:N
\tl_build_gbegin:N
\_tl_build_begin:NN
\_tl_build_begin:NNN
```

First construct the `<next tl>`: using a prime here conflicts with the usual `expl3` convention but we need a name that can be derived from `#1` without any external data such as a counter. Empty that `<next tl>` and setup the structure. The local and global versions only differ by a single function `\cs_(g)set_nopar:Npe` used for all assignments: this is important because only that function is stored in the `<tl var>` and `<next tl>` for subsequent assignments. In principle `\_tl_build_begin:NNN` could use `\tl_(g)clear_new:N` to empty `#1` and make sure it is defined, but logging the definition does not seem useful so we just do `#3 #1 {}` to clear it locally or globally as appropriate.

```
13462 \cs_new_protected:Npn \tl_build_begin:N #1
13463 { \_tl_build_begin:NN \cs_set_nopar:Npe #1 }
13464 \cs_new_protected:Npn \tl_build_gbegin:N #1
13465 { \_tl_build_begin:NN \cs_gset_nopar:Npe #1 }
13466 \cs_new_protected:Npn \_tl_build_begin:NN #1#2
13467 { \exp_args:Nc \_tl_build_begin:NNN { \cs_to_str:N #2 ' } #2 #1 }
13468 \cs_new_protected:Npn \_tl_build_begin:NNN #1#2#3
13469 {
13470   #3 #1 { }
13471   #3 #2
13472   {
13473     \exp_not:n { \exp_end: \exp_end: \exp_end: \exp_end: }
13474     \exp_not:n { \_tl_build_last:NNn #3 #1 { } }
13475   }
13476 }
```

(End of definition for `\tl_build_begin:N` and others. These functions are documented on page 133.)

`\tl_build_put_right:Nn` Similar to `\tl_put_right:Nn`, but apply `\exp:w` to #1. Most of the time this just removes one `\exp_end:`. When there are none left, `\__tl_build_last:NNn` is expanded instead.

`\tl_build_put_right:Ne` It resets the definition of the `\tl var` by ending the `\exp_not:n` and the definition

`\tl_build_put_right:Nx` early. Then it makes sure the `\next tl` (its argument #1) is set-up and starts a new

`\tl_build_gput_right:Nn` definition. Then `\__tl_build_put:nn` and `\__tl_build_put:nw` place the `\left` part

`\tl_build_gput_right:Ne` of the original `\tl var` as appropriate for the definition of the `\next tl` (the `\right`)

`\tl_build_gput_right:Nx` part is left in the right place without ever becoming a macro argument). We use `\exp_`

`\__tl_build_last:NNn` `after:wN` rather than some `\exp_args:No` to avoid reading arguments that are likely

`\__tl_build_put:nn` very long token lists. We use `\cs_(g)set_nopar:Npe` rather than `\tl_(g)set:Ne` partly

`\__tl_build_put:nw` for the same reason and partly because the assignments are interrupted by brace tricks, which implies that the assignment does not simply set the token list to an e-expansion of the second argument.

```

13477 \cs_new_protected:Npn \tl_build_put_right:Nn #1#2
13478 {
13479   \cs_set_nopar:Npe #1
13480   { \__kernel_exp_not:w \exp_after:wN { \exp:w #1 #2 } }
13481 }
13482 \cs_generate_variant:Nn \tl_build_put_right:Nn { Ne , Nx }
13483 \cs_new_protected:Npn \tl_build_gput_right:Nn #1#2
13484 {
13485   \cs_gset_nopar:Npe #1
13486   { \__kernel_exp_not:w \exp_after:wN { \exp:w #1 #2 } }
13487 }
13488 \cs_generate_variant:Nn \tl_build_gput_right:Nn { Ne , Nx }
13489 \cs_new_protected:Npn \__tl_build_last:NNn #1#2
13490 {
13491   \if_false: { { \fi:
13492     \exp_end: \exp_end: \exp_end: \exp_end: \exp_end:
13493     \__tl_build_last:NNn #1 #2 { }
13494   }
13495 }
13496 \if_meaning:w \c_empty_tl #2
13497   \__tl_build_begin:NN #1 #2
13498 \fi:
13499 #1 #2
13500 {
13501   \__kernel_exp_not:w \exp_after:wN
13502   {
13503     \exp:w \if_false: } } \fi:
13504     \exp_after:wN \__tl_build_put:nn \exp_after:wN {#2}
13505 }
13506 \cs_new_protected:Npn \__tl_build_put:nn #1#2 { \__tl_build_put:nw {#2} #1 }
13507 \cs_new_protected:Npn \__tl_build_put:nw #1#2 \__tl_build_last:NNn #3#4#5
13508   { #2 \__tl_build_last:NNn #3 #4 { #1 #5 } }

```

(End of definition for `\tl_build_put_right:Nn` and others. These functions are documented on page 133.)

`\tl_build_put_left:Nn` See `\tl_build_put_right:Nn` for all the machinery. We could easily provide `\tl_`

`\tl_build_put_left:Ne` `build_put_left_right:NNn`, by just adding the `\right` material after the `\left` in

`\tl_build_put_left:Nx` the e-expanding assignment.

`\tl_build_gput_left:Nn`

`\tl_build_gput_left:Ne`

`\tl_build_gput_left:Nx`

`\__tl_build_put_left:NNn`

```

13509 \cs_new_protected:Npn \tl_build_put_left:Nn #1
13510 { \__tl_build_put_left:NNn \cs_set_nopar:Npe #1 }
13511 \cs_generate_variant:Nn \tl_build_put_left:Nn { Ne , Nx }
13512 \cs_new_protected:Npn \tl_build_gput_left:Nn #1
13513 { \__tl_build_put_left:NNn \cs_gset_nopar:Npe #1 }
13514 \cs_generate_variant:Nn \tl_build_gput_left:Nn { Ne , Nx }
13515 \cs_new_protected:Npn \__tl_build_put_left:NNn #1#2#3
13516 {
13517     #1 #2
13518     {
13519         \__kernel_exp_not:w \exp_after:wN
13520         {
13521             \exp:w \exp_after:wN \__tl_build_put:nn
13522             \exp_after:wN {#2} {#3}
13523         }
13524     }
13525 }

```

(End of definition for `\tl_build_put_left:Nn`, `\tl_build_gput_left:Nn`, and `\__tl_build_put_left:NNn`. These functions are documented on page 133.)

`\tl_build_end:N` Get the data then clear the `<next tl>` recursively until finding an empty one. It is perhaps wasteful to repeatedly use `\cs_to_str:N`. The local/global scope is checked by `\tl_set:Ne` or `\tl_gset:Ne`.

`\tl_build_gend:N`

`\__tl_build_end_loop:NN`

```

13526 \cs_new_protected:Npn \tl_build_end:N #1
13527 {
13528     \__tl_build_get:NNN \__kernel_tl_set:Nx #1 #1
13529     \exp_args:Nc \__tl_build_end_loop:NN { \cs_to_str:N #1 ' } \tl_clear:N
13530 }
13531 \cs_new_protected:Npn \tl_build_gend:N #1
13532 {
13533     \__tl_build_get:NNN \__kernel_tl_gset:Nx #1 #1
13534     \exp_args:Nc \__tl_build_end_loop:NN { \cs_to_str:N #1 ' } \tl_gclear:N
13535 }
13536 \cs_new_protected:Npn \__tl_build_end_loop:NN #1#2
13537 {
13538     \if_meaning:w \c_empty_tl #1
13539     \exp_after:wN \use_none:nnnnnn
13540     \fi:
13541     #2 #1
13542     \exp_args:Nc \__tl_build_end_loop:NN { \cs_to_str:N #1 ' } #2
13543 }

```

(End of definition for `\tl_build_end:N`, `\tl_build_gend:N`, and `\__tl_build_end_loop:NN`. These functions are documented on page 134.)

`\tl_build_get_intermediate:NN`

```

13544 \cs_new_protected:Npn \tl_build_get_intermediate:NN
13545 { \__tl_build_get:NNN \__kernel_tl_set:Nx }

```

(End of definition for `\tl_build_get_intermediate:NN`. This function is documented on page 134.)

`\__tl_build_get:NNN` The idea is to expand the `<tl var>` then the `<next tl>` and so on, all within an expanding assignment, and wrap as appropriate in `\exp_not:n`. The various `<left>` parts are left in the assignment as we go, which enables us to expand the `<next tl>` at

`\__tl_build_get:w`

`\__tl_build_get_end:w`

the right place. The various *⟨right⟩* parts are eventually picked up in one last `\exp_not:n`, with a brace trick to wrap all the *⟨right⟩* parts together.

```

13546 \cs_new_protected:Npn \__tl_build_get:NNN #1#2#3
13547   { #1 #3 { \if_false: { \fi: \exp_after:wN \__tl_build_get:w #2 } } }
13548 \cs_new:Npn \__tl_build_get:w #1 \__tl_build_last:NNn #2#3#4
13549   {
13550     \exp_not:n {#4}
13551     \if_meaning:w \c_empty_tl #3
13552       \exp_after:wN \__tl_build_get_end:w
13553     \fi:
13554     \exp_after:wN \__tl_build_get:w #3
13555   }
13556 \cs_new:Npn \__tl_build_get_end:w #1#2#3
13557   { \__kernel_exp_not:w \exp_after:wN { \if_false: } \fi: }

```

*(End of definition for `\__tl_build_get:NNN`, `\__tl_build_get:w`, and `\__tl_build_get_end:w`.)*

```

13558 </code>

```

(End of definition for `\str_new:N` and others. These functions are documented on page 136.)

**\str\_set:Nn** Similar to corresponding `l3tl` base functions, except that `\__kernel_exp_not:w` is replaced with `\__kernel_tl_to_str:w`. Just like token list, string constants use `\cs_gset_nopar:Npe` instead of `\__kernel_tl_gset:Nx` so that the scope checking for `c` is applied when `l3debug` is used. To maintain backward compatibility, in `\str_(g)put_left:Nn` and `\str_(g)put_right:Nn`, contents of string variables are wrapped in `\__kernel_exp_not:w` to prevent further expansion.

## 58.3 Modifying string variables

<pre> \str_replace_all:Nnn \str_replace_all:cnn \str_greplace_all:Nnn \str_greplace_all:cnn \str_replace_once:Nnn \str_replace_once:cnn \str_greplace_once:Nnn \str_greplace_once:cnn \__str_replace:NNNnn \__str_replace_aux:NNNnnn \__str_replace_next:w </pre>	<p>Start by applying <code>\tl_to_str:n</code> to convert the old and new token lists to strings, and also apply <code>\tl_to_str:N</code> to avoid any issues if we are fed a token list variable. Then the code is a much simplified version of the token list code because neither the delimiter nor the replacement can contain macro parameters or braces. The delimiter <code>\s__str_</code> cannot appear in the string to edit so it is used in all cases. Some e-expansion is unnecessary. There is no need to avoid losing braces nor to protect against expansion. The ending code is much simplified and does not need to hide in braces.</p> <pre> 13632 \cs_new_protected:Npn \str_replace_once:Nnn 13633 { \__str_replace:NNNnn \prg_do_nothing: \__kernel_tl_set:Nx } 13634 \cs_new_protected:Npn \str_greplace_once:Nnn 13635 { \__str_replace:NNNnn \prg_do_nothing: \__kernel_tl_gset:Nx } 13636 \cs_new_protected:Npn \str_replace_all:Nnn 13637 { \__str_replace:NNNnn \__str_replace_next:w \__kernel_tl_set:Nx } 13638 \cs_new_protected:Npn \str_greplace_all:Nnn 13639 { \__str_replace:NNNnn \__str_replace_next:w \__kernel_tl_gset:Nx } 13640 \cs_generate_variant:Nn \str_replace_once:Nnn { c } 13641 \cs_generate_variant:Nn \str_greplace_once:Nnn { c } 13642 \cs_generate_variant:Nn \str_replace_all:Nnn { c } 13643 \cs_generate_variant:Nn \str_greplace_all:Nnn { c } 13644 \cs_new_protected:Npn \__str_replace:NNNnn #1#2#3#4#5 13645 { 13646     \tl_if_empty:nTF {#4} 13647     { 13648         \msg_error:nne { kernel } { empty-search-pattern } {#5} 13649     } 13650     { </pre>

13684 \prg_new_eq_conditional:NNn \str_if_exist:N \tl_if_exist:N
13685 { p , T , F , TF }
13686 \prg_new_eq_conditional:NNn \str_if_exist:c \tl_if_exist:c
13687 { p , T , F , TF }
13688 \prg_new_eq_conditional:NNn \str_if_empty:N \tl_if_empty:N

```

```

13689 { p , T , F , TF }
13690 \prg_new_eq_conditional:NNn \str_if_empty:c \tl_if_empty:c
13691 { p , T , F , TF }
13692 \prg_new_eq_conditional:NNn \str_if_empty:n \tl_if_empty:n
13693 { p , T , F , TF }

```

(End of definition for `\str_if_empty:NTF`, `\str_if_empty:nTF`, and `\str_if_exist:NTF`. These functions are documented on page 137.)

`\__str_if_eq:nn` String comparisons rely on the primitive `\(pdf)strcmp`, so we define a new name for it.

```

13694 \cs_new_eq:NN \__str_if_eq:nn \tex_strcmp:D

```

(End of definition for `\__str_if_eq:nn`.)

`\str_compare_p:nNn` Simply rely on `\__str_if_eq:nn`, which expands to -1, 0 or 1. The `ee` version is created directly because it is more efficient.

`\str_compare_p:eNe`  
`\str_compare:nNnTF`  
`\str_compare:eNeTF`

```

13695 \prg_new_conditional:Npnn \str_compare:nNn #1#2#3 { p , T , F , TF }
13696 {
13697   \if_int_compare:w
13698     \__str_if_eq:nn { \exp_not:n {#1} } { \exp_not:n {#3} }
13699     #2 \c_zero_int
13700     \prg_return_true: \else: \prg_return_false: \fi:
13701 }
13702 \prg_new_conditional:Npnn \str_compare:eNe #1#2#3 { p , T , F , TF }
13703 {
13704   \if_int_compare:w \__str_if_eq:nn {#1} {#3} #2 \c_zero_int
13705   \prg_return_true: \else: \prg_return_false: \fi:
13706 }

```

(End of definition for `\str_compare:nNnTF`. This function is documented on page 139.)

`\str_if_eq_p:nn` Modern engines provide a direct way of comparing two token lists, but returning a number. This set of conditionals therefore makes life a bit clearer. The `nn` and `ee` versions are created directly as this is most efficient. Since `\__str_if_eq:nn` will expand to 0 as an explicit character with category 12 if the two lists match (and either -1 or 1 if they don't) we can use `\if:w` here which is faster than using `\if_int_compare:w`.

```

13707 \prg_new_conditional:Npnn \str_if_eq:nn #1#2 { p , T , F , TF }
13708 {
13709   \if:w 0 \__str_if_eq:nn { \exp_not:n {#1} } { \exp_not:n {#2} }
13710   \prg_return_true: \else: \prg_return_false: \fi:
13711 }
13712 \prg_generate_conditional_variant:Nnn \str_if_eq:nn
13713 { V , v , o , nV , no , VV , nv } { p , T , F , TF }
13714 \prg_new_conditional:Npnn \str_if_eq:ee #1#2 { p , T , F , TF }
13715 {
13716   \if:w 0 \__str_if_eq:nn {#1} {#2}
13717   \prg_return_true: \else: \prg_return_false: \fi:
13718 }

```

(End of definition for `\str_if_eq:nnTF`. This function is documented on page 138.)

`\str_if_eq_p:NN` Note that `\str_if_eq:NNTF` is different from `\tl_if_eq:NNTF` because it needs to ignore category codes.

`\str_if_eq_p:Nc`  
`\str_if_eq_p:cN`  
`\str_if_eq_p:cc`  
`\str_if_eq:NNTF`  
`\str_if_eq:NcTF`  
`\str_if_eq:cNTF`  
`\str_if_eq:ccTF`

```

13719 \prg_new_conditional:Npnn \str_if_eq:NN #1#2 { p , TF , T , F }
13720 {

```

```

13721     \if:w 0 \__str_if_eq:nn { \tl_to_str:N #1 } { \tl_to_str:N #2 }
13722     \prg_return_true: \else: \prg_return_false: \fi:
13723   }
13724   \prg_generate_conditional_variant:Nnn \str_if_eq:NN
13725   { c , Nc , cc } { T , F , TF , p }

```

(End of definition for `\str_if_eq:NNTF`. This function is documented on page 137.)

`\str_if_in:NnTF` Everything here needs to be detokenized but beyond that it is a simple token list test.  
`\str_if_in:cnTF` It would be faster to fine-tune the T, F, TF variants by calling the appropriate variant of  
`\str_if_in:nnTF` `\tl_if_in:nnTF` directly but that takes more code.

```

13726   \prg_new_protected_conditional:Npnn \str_if_in:Nn #1#2 { T , F , TF }
13727   {
13728     \use:e
13729     { \tl_if_in:nnTF { \tl_to_str:N #1 } { \tl_to_str:n {#2} } }
13730     { \prg_return_true: } { \prg_return_false: }
13731   }
13732   \prg_generate_conditional_variant:Nnn \str_if_in:Nn
13733   { c } { T , F , TF }
13734   \prg_new_protected_conditional:Npnn \str_if_in:nn #1#2 { T , F , TF }
13735   {
13736     \use:e
13737     { \tl_if_in:nnTF { \tl_to_str:n {#1} } { \tl_to_str:n {#2} } }
13738     { \prg_return_true: } { \prg_return_false: }
13739   }

```

(End of definition for `\str_if_in:NnTF` and `\str_if_in:nnTF`. These functions are documented on page 138.)

`\str_case:nn` The aim here is to allow the case statement to be evaluated using a known number of  
`\str_case:Vn` expansion steps (two), and without needing to use an explicit “end of recursion” marker.  
`\str_case:on` That is achieved by using the test input as the final case, as this is always true. The  
`\str_case:en` trick is then to tidy up the output such that the appropriate case code plus either the  
`\str_case:nV` true or false branch code is inserted.  
`\str_case:nv` 13740 \cs\_new:Npn \str\_case:nn #1#2

13804 }

```

To tidy up the recursion, there are two outcomes. If there was a hit to one of the cases searched for, then #1 is the code to insert, #2 is the *next* case to check on and #3 is all of the rest of the cases code. That means that #4 is the **true** branch code, and #5 tidies up the spare \s\_\_str\_mark and the **false** branch. On the other hand, if none of the cases matched then we arrive here using the “termination” case of comparing the search with itself. That means that #1 is empty, #2 is the first \s\_\_str\_mark and so #4 is the **false** code (the **true** code is mopped up by #3).

```

13805 \cs_new:Npn \__str_case_end:nw #1#2#3 \s__str_mark #4#5 \s__str_stop

```

```
13806 { \exp_end: #1 #4 }

```

The inline and variable mappings are similar to the usual token list mappings but start out by turning the argument to an “other string”. Doing the same for the expandable function mapping would require `\__kernel_str_to_other:n`, quadratic in the string length. To deal with spaces in that case, `\__str_map_function:w` replaces the following space by a braced space and a further call to itself. These are received by `\__str_map_function:nn`, which passes the space to `#1` and calls `\__str_map_function:w` to deal with the next space. The space before the braced space allows to optimize the `\q__str_recursion_tail` test. Of course we need to include a trailing space (the question mark is needed to avoid losing the space when TeX tokenizes the line). At the cost of about three more auxiliaries this code could get a 9 times speed up by testing only every 9-th character for whether it is `\q__str_recursion_tail` (also by converting 9 spaces at a time in the `\str_map_function:nN` case).

For the `map_variable` functions we use a string assignment to store each character because spaces are made catcode 12 before the loop.

## 58.6 Accessing specific characters in a string

`\__kernel_str_to_other:n` First apply `\tl_to_str:n`, then replace all spaces by “other” spaces, 8 at a time, storing the converted part of the string between the `\s__str_mark` and `\s__str_stop` markers. `\__str_to_other_loop:w` The end is detected when `\__str_to_other_loop:w` finds one of the trailing A, distinguished from any contents of the initial token list by their category. Then `\__str_to_other_end:w` is called, and finds the result between `\s__str_mark` and the first A (well, there is also the need to remove a space).

```

13885 \cs_new:Npn \__kernel_str_to_other:n #1
13886 {
13887   \exp_after:wN \__str_to_other_loop:w
13888   \tl_to_str:n {#1} ~ A ~ A ~ A ~ A ~ A ~ A ~ A ~ \s__str_mark \s__str_stop
13889 }
13890 \group_begin:
13891 \tex_lccode:D '\* = '\ %
13892 \tex_lccode:D '\A = '\A %
13893 \tex_lowercase:D
13894 {
13895   \group_end:
13896   \cs_new:Npn \__str_to_other_loop:w
13897     #1 ~ #2 ~ #3 ~ #4 ~ #5 ~ #6 ~ #7 ~ #8 ~ #9 \s__str_stop
13898   {
13899     \if_meaning:w A #8

```

(End of definition for \\_str\\_sep:.)

**\str\\_item:Nn** The \str\\_item:n hands its argument with spaces escaped to \\_str\\_item:nn, and makes sure to turn the result back into a proper string (with category code 10 spaces) eventually. The \str\\_item\\_ignore\\_spaces:nn function does not escape spaces, which are thus ignored by \\_str\\_item:nn since everything else is done with unlimited arguments. Evaluate the <index> argument #2 and count characters in the string, passing those two numbers to \\_str\\_item:w for further analysis. If the <index> is negative, shift it by the <count> to know the how many character to discard, and if that is still negative give an empty result. If the <index> is larger than the <count>, give an empty result, and otherwise discard <index> - 1 characters before returning the following one. The shift by -1 is obtained by inserting an empty brace group before the string in that case: that brace group also covers the case where the <index> is zero.

\\_\_str\_skip\_exp\_end:w Removes  $\max(\#1, 0)$  characters from the input stream, and then leaves \exp\_end:. This should be expanded using \exp:w. We remove characters 8 at a time until there are at most 8 to remove. Then we do a dirty trick: the \if\_case:w construction leaves between 0 and 8 times the \or: control sequence, and those \or: become arguments of \\_\_str\_skip\_end:NNNNNNNN. If the number of characters to remove is 6, say, then there are two \or: left, and the 8 arguments of \\_\_str\_skip\_end:NNNNNNNN are the two \or:, and 6 characters from the input stream, exactly what we wanted to remove. Then close the \if\_case:w conditional with \fi:, and stop the initial expansion with \exp\_end: (see places where \\_\_str\_skip\_exp\_end:w is called).

(End of definition for `\_str_range_normalize:nn`.)

`\_str_collect_delimit_by_q_stop:w` Collects `max(#1,0)` characters, and removes everything else until `\s\_str_stop`. This is somewhat similar to `\_str_skip_exp_end:w`, but accepts integer expression arguments. `\_str_collect_loop:wn` This time we can only grab 7 characters at a time. At the end, we use an `\if_case:w` trick again, so that the 8 first arguments of `\_str_collect_end:nnnnnnnnw` are some `\or:`, followed by an `\fi:`, followed by #1 characters from the input stream. Simply leaving this in the input stream closes the conditional properly and the `\or:` disappear.

## 58.7 Counting characters

`\str_count_spaces:N` To speed up this function, we grab and discard 9 space-delimited arguments in each iteration of the loop. The loop stops when the last argument is one of the trailing `X⟨number⟩`, and that `⟨number⟩` is added to the sum of 9 that precedes, to adjust the result.

```

14069 \cs_new:Npn \str_count_spaces:N
14070 { \exp_args:No \str_count_spaces:n }
14071 \cs_generate_variant:Nn \str_count_spaces:N { c }
14072 \cs_new:Npn \str_count_spaces:n #1
14073 {

```

```

14074 \int_eval:n
14075 {
14076   \exp_after:wN \__str_count_spaces_loop:w
14077   \tl_to_str:n {#1} ~
14078   X 7 ~ X 6 ~ X 5 ~ X 4 ~ X 3 ~ X 2 ~ X 1 ~ X 0 ~ X -1 ~
14079   \s__str_stop
14080 }
14081 }
14082 \cs_new:Npn \__str_count_spaces_loop:w #1~#2~#3~#4~#5~#6~#7~#8~#9~
14083 {
14084   \if_meaning:w X #9
14085     \__str_use_i_delimit_by_s_stop:nw
14086   \fi:
14087   9 + \__str_count_spaces_loop:w
14088 }

```

(End of definition for `\str_count_spaces:N`, `\str_count_spaces:n`, and `\__str_count_spaces_loop:w`. These functions are documented on page 141.)

`\str_count:N` To count characters in a string we could first escape all spaces using `\__kernel_str_-to_other:n`, then pass the result to `\tl_count:n`. However, the escaping step would be quadratic in the number of characters in the string, and we can do better. Namely, `\str_count:n` sum the number of spaces (`\str_count_spaces:n`) and the result of `\tl_count:n`, which ignores spaces. Since strings tend to be longer than token lists, we use specialized functions to count characters ignoring spaces. Namely, `loop`, grabbing 9 non-space characters at each step, and end as soon as we reach one of the 9 trailing items. The internal function `\__str_count:n`, used in `\str_item:nn` and `\str_range:nnn`, is similar to `\str_count_ignore_spaces:n` but expects its argument to already be a string or a string with spaces escaped.

```

14089 \cs_new:Npn \str_count:N { \exp_args:No \str_count:n }

## 58.8 The first character in a string

`\str_head:N` The `\_ignore_spaces` variant applies `\tl_to_str:n` then grabs the first item, thus skipping spaces. As usual, `\str_head:N` expands its argument and hands it to `\str_head:n`.  
`\str_head:c` To circumvent the fact that  $\TeX$  skips spaces when grabbing undelimited macro parameters, `\__str_head:w` takes an argument delimited by a space. If `#1` starts with a non-space character, `\__str_use_i_delimit_by_s_stop:nw` leaves that in the input stream. On the other hand, if `#1` starts with a space, the `\__str_head:w` takes an empty argument, and the single (initially braced) space in the definition of `\__str_head:w` makes its way to the output. Finally, for an empty argument, the (braced) empty brace group in the definition of `\str_head:n` gives an empty result after passing through `\__str_use_i_delimit_by_s_stop:nw`.

```

14127 \cs_new:Npn \str_head:N { \exp_args:No \str_head:n }
14128 \cs_generate_variant:Nn \str_head:N { c }
14129 \cs_new:Npn \str_head:n #1
14130 {
14131     \exp_after:wN \__str_head:w
14132     \tl_to_str:n {#1}
14133     { { } } ~ \s__str_stop
14134 }
14135 \cs_new:Npn \__str_head:w #1 ~ %
14136 { \__str_use_i_delimit_by_s_stop:nw #1 { ~ } }
14137 \cs_new:Npn \str_head_ignore_spaces:n #1
14138 {
14139     \exp_after:wN \__str_use_i_delimit_by_s_stop:nw
14140     \tl_to_str:n {#1} { } \s__str_stop
14141 }

```

(End of definition for `\str_head:N` and others. These functions are documented on page 142.)

`\str_tail:N` Getting the tail is a little bit more convoluted than the head of a string. We hit the front of the string with `\reverse_if:N` `\if_charcode:w` `\scan_stop:.` This removes the first character, and necessarily makes the test true, since the character cannot match `\scan_stop:.` The auxiliary function then inserts the required `\fi:` to close the conditional, and leaves the tail of the string in the input stream. The details are such that an empty string has an empty tail (this requires in particular that the end-marker `X` be unexpandable and

not a control sequence). The `_ignore_spaces` is rather simpler: after converting the input to a string, `\__str_tail_auxii:w` removes one undelimited argument and leaves everything else until an end-marker `\s__str_mark`. One can check that an empty (or blank) string yields an empty tail.

```

14142 \cs_new:Npn \str_tail:N { \exp_args:No \str_tail:n }
14143 \cs_generate_variant:Nn \str_tail:N { c }
14144 \cs_new:Npn \str_tail:n #1
14145 {
14146   \exp_after:wN \__str_tail_auxi:w

```

(End of definition for `\str_tail:N` and others. These functions are documented on page 142.)

## 58.9 String manipulation

`\str_casefold:n`  
`\str_casefold:V`  
`\str_lowercase:n`  
`\str_lowercase:f`  
`\str_uppercase:n`  
`\str_uppercase:f`

Case changing for programmatic reasons is done by first detokenizing input then doing a simple loop that only has to worry about spaces and everything else. The output is detokenized to allow data sharing with text-based case changing. Similarly, for 8-bit engines the multi-byte information is shared.

```

14157 \cs_new:Npn \str_casefold:n #1 { \__str_change_case:nn {#1} { casefold } }

14328 `\tl_new:N l__str_tmp_tl`

*(End of definition for `__str_tmp:w` and `l__str_tmp_tl`.)*

`g__str_result_tl` The `g__str_result_tl` variable is used to hold the result of various internal string operations (mostly conversions) which are typically performed in a group. The variable is global so that it remains defined outside the group, to be assigned to a user-provided variable.

14329 `\tl_new:N g__str_result_tl`

*(End of definition for `g__str_result_tl`.)*

`c__str_replacement_char_int` When converting, invalid bytes are replaced by the Unicode replacement character "FFFD.

14330 `\int_const:Nn c__str_replacement_char_int { "FFFD }`

*(End of definition for `c__str_replacement_char_int`.)*

`c__str_max_byte_int` The maximal byte number.  
14331 `\int_const:Nn c__str_max_byte_int { 255 }`

*(End of definition for `c__str_max_byte_int`.)*

`s__str` Internal scan marks.

14332 `\scan_new:N s__str`

*(End of definition for `s__str`.)*

`\q__str_nil` Internal quarks.

```
14333 \quark_new:N \q__str_nil
```

*(End of definition for \q\_\_str\_nil.)*

`\g__str_alias_prop` To avoid needing one file per encoding/escaping alias, we keep track of those in a property list.

```
14334 \prop_new:N \g__str_alias_prop
14335 \prop_gput:Nnn \g__str_alias_prop { latin1 } { iso88591 }
14336 \prop_gput:Nnn \g__str_alias_prop { latin2 } { iso88592 }
14337 \prop_gput:Nnn \g__str_alias_prop { latin3 } { iso88593 }
14338 \prop_gput:Nnn \g__str_alias_prop { latin4 } { iso88594 }
14339 \prop_gput:Nnn \g__str_alias_prop { latin5 } { iso88599 }
14340 \prop_gput:Nnn \g__str_alias_prop { latin6 } { iso885910 }
14341 \prop_gput:Nnn \g__str_alias_prop { latin7 } { iso885913 }
14342 \prop_gput:Nnn \g__str_alias_prop { latin8 } { iso885914 }
14343 \prop_gput:Nnn \g__str_alias_prop { latin9 } { iso885915 }
14344 \prop_gput:Nnn \g__str_alias_prop { latin10 } { iso885916 }
14345 \prop_gput:Nnn \g__str_alias_prop { utf16le } { utf16 }
14346 \prop_gput:Nnn \g__str_alias_prop { utf16be } { utf16 }
14347 \prop_gput:Nnn \g__str_alias_prop { utf32le } { utf32 }
14348 \prop_gput:Nnn \g__str_alias_prop { utf32be } { utf32 }
14349 \prop_gput:Nnn \g__str_alias_prop { hexadecimal } { hex }
14350 \bool_lazy_any:nTF
14351 {
14352   \sys_if_engine luatex_p:
14353   \sys_if_engine xetex_p:
14354 }
14355 {
14356   \prop_gput:Nnn \g__str_alias_prop { default } { }
14357 }
14358 {
14359   \prop_gput:Nnn \g__str_alias_prop { default } { utf8 }
14360 }
```

*(End of definition for \g\_\_str\_alias\_prop.)*

`\g__str_error_bool` In conversion functions with a built-in conditional, errors are not reported directly to the user, but the information is collected in this boolean, used at the end to decide on which branch of the conditional to take.

```
14361 \bool_new:N \g__str_error_bool
```

*(End of definition for \g\_\_str\_error\_bool.)*

`\l__str_byte_flag` `\l__str_error_flag` Conversions from one *<encoding>*/*<escaping>* pair to another are done within e-expanding assignments. Errors are signalled by raising the relevant flag.

```
14362 \flag_new:N \l__str_byte_flag
14363 \flag_new:N \l__str_error_flag
```

*(End of definition for \l\_\_str\_byte\_flag and \l\_\_str\_error\_flag.)*

## 59.2 String conditionals

`\_str_if_contains_char:NnT`      `\_str_if_contains_char:nnTF {<token list>} <char>`  
`\_str_if_contains_char:NnTF`      Expects the `<token list>` to be an `<other string>`: the caller is responsible for  
`\_str_if_contains_char:nnTF`      ensuring that no (too-)special catcodes remain. Loop over the characters of the string,  
     `\_str_if_contains_char_aux:nn`      comparing character codes. The loop is broken if character codes match. Otherwise we  
     `\_str_if_contains_char_aux:nN`      return “false”.  
     `\_str_if_contains_char_true:`

```

14364 \prg_new_conditional:Npnn \_str_if_contains_char:Nn #1#2 { T , TF }
14365 {
14366   \exp_after:wN \_str_if_contains_char_aux:nn \exp_after:wN {#1} {#2}
14367   { \prg_break:n { ? \fi: } }
14368   \prg_break_point:
14369   \prg_return_false:
14370 }
14371 \cs_new:Npn \_str_if_contains_char_aux:nn #1#2
14372 { \_str_if_contains_char_aux:nN {#2} #1 }
14373 \prg_new_conditional:Npnn \_str_if_contains_char:nn #1#2 { TF }
14374 {
14375   \_str_if_contains_char_aux:nN {#2} #1 { \prg_break:n { ? \fi: } }
14376   \prg_break_point:
14377   \prg_return_false:
14378 }
14379 \cs_new:Npn \_str_if_contains_char_auxi:nN #1#2
14380 {
14381   \if_charcode:w #1 #2
14382     \exp_after:wN \_str_if_contains_char_true:
14383     \fi:
14384     \_str_if_contains_char_auxi:nN {#1}
14385 }
14386 \cs_new:Npn \_str_if_contains_char_true:
14387 { \prg_break:n { \prg_return_true: \use_none:n } }
```

(End of definition for `\_str_if_contains_char:NnT` and others.)

`\_str_octal_use:NTF`      `\_str_octal_use:NTF <token> {<true code>} {<false code>}`  
 If the `<token>` is an octal digit, it is left in the input stream, *followed* by the `<true code>`. Otherwise, the `<false code>` is left in the input stream.

**T<sub>E</sub>Xhackers note:** This function will fail if the escape character is an octal digit. We are thus careful to set the escape character to a known value before using it. T<sub>E</sub>X dutifully detects

octal digits for us: if #1 is an octal digit, then the right-hand side of the comparison is '1#1, greater than 1. Otherwise, the right-hand side stops as '1, and the conditional takes the false branch.

```

14388 \prg_new_conditional:Npnn \_str_octal_use:N #1 { TF }
14389 {
14390   \if_int_compare:w 1 < '1 \token_to_str:N #1 \exp_stop_f:
14391   #1 \prg_return_true:
14392   \else:
14393     \prg_return_false:
14394   \fi:
14395 }
```

(End of definition for `\_str_octal_use:NTF`.)

`\__str_hexadecimal_use:N`TF TeX detects uppercase hexadecimal digits for us (see `\__str_octal_use:N`TF), but not the lowercase letters, which we need to detect and replace by their uppercase counterpart.

```

14396 \prg_new_conditional:Npnn \__str_hexadecimal_use:N #1 { TF }
14397 {
14398   \if_int_compare:w 1 < "1 \token_to_str:N #1 \exp_stop_f:
14399     #1 \prg_return_true:
14400   \else:
14401     \if_case:w \int_eval:n { \exp_after:wN ' \token_to_str:N #1 - 'a }
14402       A
14403     \or: B
14404     \or: C
14405     \or: D
14406     \or: E
14407     \or: F
14408     \else:
14409       \prg_return_false:
14410       \exp_after:wN \use_none:n
14411     \fi:
14412     \prg_return_true:
14413   \fi:
14414 }

```

(End of definition for `\__str_hexadecimal_use:N`TF.)

## 59.3 Conversions

### 59.3.1 Producing one byte or character

`\c__str_byte_0_tl` For each integer  $N$  in the range  $[0, 255]$ , we create a constant token list which holds three character tokens with category code other: the character with character code  $N$ , followed by the representation of  $N$  as two hexadecimal digits. The value  $-1$  is given a default token list which ensures that later functions give an empty result for the input  $-1$ .

```

14415 \group_begin:
14416   \__kernel_tl_set:Nx \l__str_tmp_tl { \tl_to_str:n { 0123456789ABCDEF } }
14417   \tl_map_inline:Nn \l__str_tmp_tl
14418     {
14419       \tl_map_inline:Nn \l__str_tmp_tl
14420         {
14421           \tl_const:ce { c__str_byte_ \int_eval:n {"#1##1} _tl }
14422           { \char_generate:nn { "#1##1 } { 12 } #1 ##1 }
14423         }
14424     }
14425 \group_end:
14426 \tl_const:cn { c__str_byte_-1_tl } { { } \use_none:n { } }

```

(End of definition for `\c__str_byte_0_tl` and others.)

`\__str_output_byte:n` Those functions must be used carefully: feeding them a value outside the range  $[-1, 255]$  will attempt to use the undefined token list variable `\c__str_byte_⟨number⟩_tl`. Assuming that the argument is in the right range, we expand the corresponding token list, and pick either the byte (first token) or the hexadecimal representations (second and third tokens). The value  $-1$  produces an empty result in both cases.

```

14427 \cs_new:Npn \__str_output_byte:n #1
14428 { \__str_output_byte:w #1 \__str_output_end: }
14429 \cs_new:Npn \__str_output_byte:w
14430 {
14431   \exp_after:wN \exp_after:wN
14432   \exp_after:wN \use_i:nnn
14433   \cs:w c__str_byte_ \int_eval:w
14434 }
14435 \cs_new:Npn \__str_output_hexadecimal:n #1
14436 {
14437   \exp_after:wN \exp_after:wN
14438   \exp_after:wN \use_none:n
14439   \cs:w c__str_byte_ \int_eval:n {#1} _tl \cs_end:
14440 }
14441 \cs_new:Npn \__str_output_end:
14442 { \scan_stop: _tl \cs_end: }

```

(End of definition for \\_\_str\_output\_byte:n and others.)

\\_\_str\_output\_byte\_pair\_be:n Convert a number in the range [0,65535] to a pair of bytes, either big-endian or little-endian.  
 \\_\_str\_output\_byte\_pair\_le:n  
 \\_\_str\_output\_byte\_pair:nnN

```

14443 \cs_new:Npn \__str_output_byte_pair_be:n #1
14444 {
14445   \exp_args:Nf \__str_output_byte_pair:nnN
14446   { \int_div_truncate:nn { #1 } { "100 } } {#1} \use:nn
14447 }
14448 \cs_new:Npn \__str_output_byte_pair_le:n #1
14449 {
14450   \exp_args:Nf \__str_output_byte_pair:nnN
14451   { \int_div_truncate:nn { #1 } { "100 } } {#1} \use_ii_i:nn
14452 }
14453 \cs_new:Npn \__str_output_byte_pair:nnN #1#2#3
14454 {
14455   #3
14456   { \__str_output_byte:n { #1 } }
14457   { \__str_output_byte:n { #2 - #1 * "100 } }
14458 }

```

(End of definition for \\_\_str\_output\_byte\_pair\_be:n, \\_\_str\_output\_byte\_pair\_le:n, and \\_\_str\_output\_byte\_pair:nnN.)

### 59.3.2 Mapping functions for conversions

\\_\_str\_convert\_gmap:N This maps the function #1 over all characters in \g\_\_str\_result\_tl, which should be a byte string in most cases, sometimes a native string.  
 \\_\_str\_convert\_gmap\_loop:NN

```

14459 \cs_new_protected:Npn \__str_convert_gmap:N #1
14460 {
14461   \__kernel_tl_gset:Nx \g__str_result_tl
14462   {
14463     \exp_after:wN \__str_convert_gmap_loop:NN
14464     \exp_after:wN #1
14465     \g__str_result_tl { ? \prg_break: }
14466     \prg_break_point:
14467   }

```

```

14468     }
14469 \cs_new:Npn \__str_convert_gmap_loop:NN #1#2
14470 {
14471     \use_none:n #2
14472     #1#2
14473     \__str_convert_gmap_loop:NN #1
14474 }

```

(End of definition for \\_\_str\_convert\_gmap:N and \\_\_str\_convert\_gmap\_loop:NN.)

```

\__str_convert_gmap_internal:N
\__str_convert_gmap_internal_loop:Nw

```

This maps the function #1 over all character codes in \g\_\_str\_result\_tl, which must be in the internal representation.

```

14475 \cs_new_protected:Npn \__str_convert_gmap_internal:N #1
14476 {
14477     \__kernel_tl_gset:Nx \g__str_result_tl
14478     {
14479         \exp_after:wN \__str_convert_gmap_internal_loop:Nww
14480         \exp_after:wN #1
14481         \g__str_result_tl \s__str \s__str_stop \prg_break: \s__str
14482         \prg_break_point:
14483     }
14484 }
14485 \cs_new:Npn \__str_convert_gmap_internal_loop:Nww #1 #2 \s__str #3 \s__str
14486 {
14487     \__str_use_none_delimit_by_s_stop:w #3 \s__str_stop
14488     #1 {#3}
14489     \__str_convert_gmap_internal_loop:Nww #1
14490 }

```

(End of definition for \\_\_str\_convert\_gmap\_internal:N and \\_\_str\_convert\_gmap\_internal\_loop:Nw.)

### 59.3.3 Error-reporting during conversion

```

\__str_if_flag_error:Nne
\__str_if_flag_no_error:Nne

```

When converting using the function \str\_set\_convert:Nnnn, errors should be reported to the user after each step in the conversion. Errors are signalled by raising some flag (typically @@\_error), so here we test that flag: if it is raised, give the user an error, otherwise remove the arguments. On the other hand, in the conditional functions \str\_set\_convert:NnnnTF, errors should be suppressed. This is done by changing \\_\_str\_if\_flag\_error:Nne into \\_\_str\_if\_flag\_no\_error:Nne locally.

```

14491 \cs_new_protected:Npn \__str_if_flag_error:Nne #1
14492 {
14493     \flag_if_raised:NTF #1
14494     { \msg_error:nne { str } }
14495     { \use_none:nn }
14496 }
14497 \cs_new_protected:Npn \__str_if_flag_no_error:Nne #1#2#3
14498 { \flag_if_raised:NT #1 { \bool_gset_true:N \g__str_error_bool } }

```

(End of definition for \\_\_str\_if\_flag\_error:Nne and \\_\_str\_if\_flag\_no\_error:Nne.)

```

\__str_if_flag_times:NT

```

At the end of each conversion step, we raise all relevant errors as one error message, built on the fly. The height of each flag indicates how many times a given error was encountered. This function prints #2 followed by the number of occurrences of an error if it occurred, nothing otherwise.

```

14499 \cs_new:Npn \__str_if_flag_times:NT #1#2
14500 { \flag_if_raised:NT #1 { #2~(x \flag_height:N #1 ) } }

```

(End of definition for \\_\_str\_if\_flag\_times:NT.)

### 59.3.4 Framework for conversions

Most functions in this module expect to be working with “native” strings. Strings can also be stored as bytes, in one of many encodings, for instance UTF8. The bytes themselves can be expressed in various ways in terms of T<sub>E</sub>X tokens, for instance as pairs of hexadecimal digits. The questions of going from arbitrary Unicode code points to bytes, and from bytes to tokens are mostly independent.

Conversions are done in four steps:

- “unescape” produces a string of bytes;
- “decode” takes in a string of bytes, and converts it to a list of Unicode characters in an internal representation, with items of the form

$\langle \text{bytes} \rangle \backslash s\_str \langle \text{Unicode code point} \rangle \backslash s\_str$

where we have collected the  $\langle \text{bytes} \rangle$  which combined to form this particular Unicode character, and the  $\langle \text{Unicode code point} \rangle$  is in the range [0, "10FFFF].

- “encode” encodes the internal list of code points as a byte string in the new encoding;
- “escape” escapes bytes as requested.

The process is modified in case one of the encoding is empty (or the conversion function has been set equal to the empty encoding because it was not found): then the unescape or escape step is ignored, and the decode or encode steps work on tokens instead of bytes. Otherwise, each step must ensure that it passes a correct byte string or internal string to the next step.

```

\str_set_convert:Nnnn
\str_gset_convert:Nnnn
\str_set_convert:NnnnTF
\str_gset_convert:NnnnTF
\__str_convert:nNNnnn

```

The input string is stored in  $\backslash g\_str\_result\_tl$ , then we: unescape and decode; encode and escape; exit the group and store the result in the user’s variable. The various conversion functions all act on  $\backslash g\_str\_result\_tl$ . Errors are silenced for the conditional functions by redefining  $\backslash \_str\_if\_flag\_error:Nne$  locally.

```

14501 \cs_new_protected:Npn \str_set_convert:Nnnn
14502 { \__str_convert:nNNnnn { } \tl_set_eq:NN }
14503 \cs_new_protected:Npn \str_gset_convert:Nnnn

14542 }

```

(End of definition for `\str_set_convert:Nnnn` and others. These functions are documented on page 150.)

`\__str_convert:wwwnn`  
`\__str_convert:NNnNN`

The task of `\__str_convert:wwwnn` is to split `<encoding>/<escaping>` pairs into their components, #1 and #2. Calls to `\__str_convert:nnn` ensure that the corresponding conversion functions are defined. The third auxiliary does the main work.

- #1 is the encoding conversion function;
- #2 is the escaping function;
- #3 is the escaping name for use in an error message;
- #4 is `\prg_do_nothing:` for unescaping/decoding, and `\use_ii_i:nn` for encoding/escaping;
- #5 is the default encoding function (either “decode” or “encode”), for which there should be no escaping.

Let us ignore the native encoding for a second. In the unescaping/decoding phase, we want to do #2#1 in this order, and in the encoding/escaping phase, the order should be reversed: #4#2#1 does exactly that. If one of the encodings is the default (native), then the escaping should be ignored, with an error if any was given, and only the encoding, #1, should be performed.

```

14543 \cs_new_protected:Npn \__str_convert:wwwnn
14544     #1 / #2 // #3 \s__str_stop #4#5
14545 {

```

```

14546     \__str_convert:nnn {enc} {#4} {#1}

(End of definition for `\__str_convert:wwwnn` and `\__str_convert:NNnNN`.)

`\__str_convert:nnn`  
`\__str_convert:nnnn`

The arguments of `\__str_convert:nnn` are: `enc` or `esc`, used to build filenames, the type of the conversion (unescape, decode, encode, escape), and the encoding or escaping name. If the function is already defined, no need to do anything. Otherwise, filter out all non-alphanumerics in the name, and lowercase it. Feed that, and the same three arguments, to `\__str_convert:nnnn`. The task is then to make sure that the conversion function `#3_#1` corresponding to the type `#3` and filtered name `#1` is defined, then set our initial conversion function `#3_#4` equal to that.

How do we get the `#3_#1` conversion to be defined if it isn't? Two main cases.

First, if `#1` is a key in `\g__str_alias_prop`, then the value `\l__str_tmp_tl` tells us what file to load. Loading is skipped if the file was already read, i.e., if the conversion command based on `\l__str_tmp_tl` already exists. Otherwise, try to load the file; if that fails, there is an error, use the default empty name instead.

Second, `#1` may be absent from the property list. The `\cs_if_exist:cF` test is automatically false, and we search for a file defining the encoding or escaping `#1` (this should allow third-party `.def` files). If the file is not found, there is an error, use the default empty name instead.

In all cases, the conversion based on `\l__str_tmp_tl` is defined, so we can set the `#3_#1` function equal to that. In some cases (e.g., `utf16be`), the `#3_#1` function is actually defined within the file we just loaded, and it is different from the `\l__str_tmp_tl`-based function: we mustn't clobber that different definition.

```

### 59.3.5 Byte unescape and escape

Strings of bytes may need to be stored in auxiliary files in safe “escaping” formats. Each such escaping is only loaded as needed. By default, on input any non-byte is filtered out, while the output simply consists in letting bytes through.

In the case of 8-bit engines, every character is a byte. For Unicode-aware engines, test the character code; non-bytes cause us to raise the flag `\l__str_byte_flag`. Spaces have already been given the correct category code when this function is called.

```

\__str_filter_bytes:n
\__str_filter_bytes_aux:N
14624 \bool_lazy_any:nTF
14625 {
14626   \sys_if_engine luatex_p:

14721 }
14722 \cs_new:Npn \__str_encode_clist_char:n #1 { , #1 }

```

(End of definition for `\__str_convert_encode_clist:` and `\__str_encode_clist_char:n`.)

### 59.3.8 8-bit encodings

It is not clear in what situations 8-bit encodings are used, hence it is not clear what should be optimized. The current approach is reasonably efficient to convert long strings, and it scales well when using many different encodings.

The data needed to support a given 8-bit encoding is stored in a file that consists of a single function call

```

\__str_declare_eight_bit_encoding:nnnn {<name>} {<modulo>} {<mapping>}
{<missing>}

```

This declares the encoding  $\langle name \rangle$  to map bytes to Unicode characters according to the  $\langle mapping \rangle$ , and map those bytes which are not mentioned in the  $\langle mapping \rangle$  either to the replacement character (if they appear in  $\langle missing \rangle$ ), or to themselves. The  $\langle mapping \rangle$  argument is a token list of pairs  $\{\langle byte \rangle\} \{\langle Unicode \rangle\}$  expressed in uppercase hexadecimal notation. The  $\langle missing \rangle$  argument is a token list of  $\{\langle byte \rangle\}$ . Every  $\langle byte \rangle$  which does not appear in the  $\langle mapping \rangle$  nor the  $\langle missing \rangle$  lists maps to itself in Unicode, so for instance the `latin1` encoding has empty  $\langle mapping \rangle$  and  $\langle missing \rangle$  lists. The  $\langle modulo \rangle$  is a (decimal) integer between 256 and 558 inclusive, modulo which all Unicode code points supported by the encodings must be different.

We use two integer arrays per encoding. When decoding we only use the `decode` integer array, with entry  $n + 1$  (offset needed because integer array indices start at 1) equal to the Unicode code point that corresponds to the  $n$ -th byte in the encoding under consideration, or  $-1$  if the given byte is invalid in this encoding. When encoding we use both arrays: upon seeing a code point  $n$ , we look up the entry  $(1 \text{ plus } n \text{ modulo some number } M)$  in the `encode` array, which tells us the byte that might encode the given Unicode code point, then we check in the `decode` array that indeed this byte encodes the Unicode code point we want. Here,  $M$  is an encoding-dependent integer between 256 and 558 (it turns out), chosen so that among the Unicode code points that can be validly represented in the given encoding, no pair of code points have the same value modulo  $M$ .

Loop through both lists of bytes to fill in the `decode` integer array, then fill the `encode` array accordingly. For bytes that are invalid in the given encoding, store  $-1$  in the `decode` array.

```

14723 \cs_new_protected:Npn \__str_declare_eight_bit_encoding:nnnn #1

```
__str_convert_encode_eight_bit:n
__str_encode_eight_bit_aux:nnN
__str_encode_eight_bit_aux:NnN
```

It is not practical to make an integer array with indices in the full Unicode range, so we work modulo some number, which is simply the size of the `encode` integer array for the given encoding. This gives us a candidate byte for representing a given Unicode code point. Of course taking the modulo leads to collisions so we check in the `decode` array that the byte we got is indeed correct. Otherwise the Unicode code point we started from is simply not representable in the given encoding.

```

## 59.4 Messages

General messages, and messages for the encodings and escapings loaded by default (“native”, and “bytes”).

```
14827 \msg_new:nnn { str } { unknown-esc }
14828 { Escaping-scheme~'#1'~(filtered:~'#2')~unknown. }
14829 \msg_new:nnn { str } { unknown-enc }
14830 { Encoding-scheme~'#1'~(filtered:~'#2')~unknown. }
14831 \msg_new:nnnn { str } { native-escaping }
14832 { The~'native'~encoding~scheme~does~not~support~any~escaping. }
14833 {
```

```

14834 Since~native~strings~do~not~consist~in~bytes,~
14835 none~of~the~escaping~methods~make~sense.~
14836 The~specified~escaping,~'#1',~will~be~ignored.
14837 }
14838 \msg_new:nnn { str } { file-not-found }
14839 { File~'l3str-#1.def'~not~found. }

```

Message used when the “bytes” unescaping fails because the string given to `\str_set_convert:Nnnn` contains a non-byte. This cannot happen for the -8-bit engines. Messages used for other escapings and encodings are defined in each definition file.

```

14840 \bool_lazy_any:nT
14841 {
14842   \sys_if_engine luatex_p:
14843   \sys_if_engine xetex_p:
14844 }
14845 {
14846   \msg_new:nnnn { str } { non-byte }
14847   { String~invalid~in~escaping~'#1':~it~may~only~contain~bytes. }
14848   {
14849     Some~characters~in~the~string~you~asked~to~convert~are~not~
14850     8-bit~characters.~Perhaps~the~string~is~a~'native'~Unicode~string?~
14851     If~it~is,~try~using\\
14852     \\
14853     \iow_indent:n
14854     {
14855       \iow_char:N\\str_set_convert:Nnnn \\
14856       \ \ <str-var>~\{~<string>~\}~\{~<native>~\}~\{~<target-encoding>~\}
14857     }
14858   }
14859 }

```

Those messages are used when converting to and from 8-bit encodings.

```

14860 \msg_new:nnnn { str } { decode-8-bit }
14861 { Invalid-string-in-encoding~'#1'. }
14862 {
14863   LaTeX~came~across~a~byte~which~is~not~defined~to~represent~

14865 }
14866 \msg_new:nnnn { str } { encode-8-bit }
14867 { Unicode-string-cannot-be-converted-to-encoding~'#1'. }
14868 {
14869   The~encoding~'#1'~only~contains~a~subset~of~all~Unicode~characters.~
14870   LaTeX~was~asked~to~convert~a~string~to~that~encoding,~but~that~
14871   string~contains~a~character~that~'#1'~does~not~support.
14872 }

```

## 59.5 Escaping definitions

Several of those encodings are defined by the pdf file format. The following byte storage methods are defined:

- **bytes** (default), non-bytes are filtered out, and bytes are left untouched (this is defined by default);

- `hex` or `hexadecimal`, as per the pdfTeX primitive `\pdfescapehex`
- `name`, as per the pdfTeX primitive `\pdfescapename`
- `string`, as per the pdfTeX primitive `\pdfescapestring`
- `url`, as per the percent encoding of urls.

### 59.5.1 Unescape methods

`\__str_convert_unescape_hex:` Take chars two by two, and interpret each pair as the hexadecimal code for a byte.  
`\__str_unescape_hex_auxi:N` Anything else than hexadecimal digits is ignored, raising the flag. A string which contains  
`\__str_unescape_hex_auxii:N` an odd number of hexadecimal digits gets 0 appended to it: this is equivalent to appending a 0 in all cases, and dropping it if it is alone.

```

14873 \cs_new_protected:Npn \__str_convert_unescape_hex:

14918 }

```

(End of definition for `__str_convert_unescape_hex:`, `__str_unescape_hex_auxi:N`, and `__str_unescape_hex_auxii:N`.)

```

__str_convert_unescape_name:
__str_unescape_name_loop:wNN
__str_convert_unescape_url:
__str_unescape_url_loop:wNN

```

The `__str_convert_unescape_name:` function replaces each occurrence of # followed by two hexadecimal digits in `\g__str_result_tl` by the corresponding byte. The `url` function is identical, with escape character % instead of #. Thus we define the two together. The arguments of `__str_tmp:w` are the character code of # or % in hexadecimal, the name of the main function to define, and the name of the auxiliary which performs the loop.

The looping auxiliary #3 finds the next escape character, reads the following two characters, and tests them. The test `__str_hexadecimal_use:NTF` leaves the upper-case digit in the input stream, hence we surround the test with `__str_output_byte:w "` and `__str_output_end:.` If both characters are hexadecimal digits, they should be removed before looping: this is done by `\use_i:nnn`. If one of the characters is not a hexadecimal digit, then feed "#1 to `__str_output_byte:w` to produce the escape character, raise the flag, and call the looping function followed by the two characters (remove `\use_i:nnn`).

\__str_convert_unescape_string:
\__str_unescape_string_newlines:wN
\__str_unescape_string_loop:wNNN
\__str_unescape_string_repeat:NNNNN

```

The **string** escaping is somewhat similar to the **name** and **url** escapings, with escape character `\`. The first step is to convert all three line endings, `^^J`, `^^M`, and `^^M^^J` to the common `^^J`, as per the PDF specification. This step cannot raise the flag.

Then the following escape sequences are decoded.

```

\ n Line feed (10)
\ r Carriage return (13)
\ t Horizontal tab (9)
\ b Backspace (8)
\ f Form feed (12)
\ ( Left parenthesis
\ ) Right parenthesis
\\ Backslash

```

`\ddd` (backslash followed by 1 to 3 octal digits) Byte `ddd` (octal), subtracting 256 in case of overflow.

If followed by an end-of-line character, the backslash and the end-of-line are ignored. If followed by anything else, the backslash is ignored, raising the error flag.

## 59.6 Encoding definitions

The **native** encoding is automatically defined. Other encodings are loaded as needed. The following encodings are supported:

- UTF-8;
- UTF-16, big-, little-endian, or with byte order mark;
- UTF-32, big-, little-endian, or with byte order mark;
- the ISO 8859 code pages, numbered from 1 to 16, skipping the inexistent ISO 8859-12.

### 59.6.1 utf-8 support

```

__str_convert_encode_utf8:
  __str_encode_utf_viii_char:n
  __str_encode_utf_viii_loop:wwnnw

```

Loop through the internal string, and convert each character to its UTF-8 representation. The representation is built from the right-most (least significant) byte to the left-most (most significant) byte. Continuation bytes are in the range [128, 191], taking 64 different values, hence we roughly want to express the character code in base 64, shifting the first digit in the representation by some number depending on how many continuation bytes there are. In the range [0, 127], output the corresponding byte directly. In the range [128, 2047], output the remainder modulo 64, plus 128 as a continuation byte, then output the quotient (which is in the range [0, 31]), shifted by 192. In the next range, [2048, 65535], split the character code into residue and quotient modulo 64, output the

residue as a first continuation byte, then repeat; this leaves us with a quotient in the range [0,15], which we output shifted by 224. The last range, [65536,1114111], follows the same pattern: once we realize that dividing twice by 64 leaves us with a number larger than 15, we repeat, producing a last continuation byte, and offset the quotient by 240 for the leading byte.

How is that implemented? `\__str_encode_utf_vii_loop:wnnw` takes successive quotients as its first argument, the quotient from the previous step as its second argument (except in step 1), the bound for quotients that trigger one more step or not, and finally the offset used if this step should produce the leading byte. Leading bytes can be in the ranges [0,127], [192,223], [224,239], and [240,247] (really, that last limit should be 244 because Unicode stops at the code point 1114111). At each step, if the quotient #1 is less than the limit #3 for that range, output the leading byte (#1 shifted by #4) and stop. Otherwise, we need one more step: use the quotient of #1 by 64, and #1 as arguments for the looping auxiliary, and output the continuation byte corresponding to the remainder #2 - 64#1 + 128. The bizarre construction `- 1 + 0 *` removes the spurious initial continuation byte (better methods welcome).

```

<code>__str_missing</code> <code>__str_extra</code> <code>__str_overlong</code> <code>__str_overflow</code>	When decoding a string that is purportedly in the UTF-8 encoding, four different errors can occur, signalled by a specific flag for each (we define those flags using <code>\flag_clear_new:N</code> rather than <code>\flag_new:N</code> , because they are shared with other encoding definition files).
--	--

- “Missing continuation byte”: a leading byte is not followed by the right number of continuation bytes.
- “Extra continuation byte”: a continuation byte appears where it was not expected, i.e., not after an appropriate leading byte.

- “Overlong”: a Unicode character is expressed using more bytes than necessary, for instance, "C0"80 for the code point 0, instead of a single null byte.
- “Overflow”: this occurs when decoding produces Unicode code points greater than 1114111.

We only raise one L<sup>A</sup>T<sub>E</sub>X3 error message, combining all the errors which occurred. In the short message, the leading comma must be removed to get a grammatically correct sentence. In the long text, first remind the user what a correct UTF-8 string should look like, then add error-specific information.

(End of definition for `__str_missing` and others.)

`__str_convert_decode_utf8:` Decoding is significantly harder than encoding. As before, lower some flags, which are tested at the end (in bulk, to trigger at most one L<sup>A</sup>T<sub>E</sub>X3 error, as explained above).  
`\_str_decode_utf_viii_start:N` We expect successive multi-byte sequences of the form *⟨start byte⟩* *⟨continuation bytes⟩*. The `_start` auxiliary tests the first byte:  
`\_str_decode_utf_viii_continuation:wwN`  
`\_str_decode_utf_viii_aux:wNnnwN`  
`\_str_decode_utf_viii_overflow:w`  
`__str_decode_utf_viii_end:`

- [0, "7F]: the byte stands alone, and is converted to its own character code;
- ["80, "BF]: unexpected continuation byte, raise the appropriate flag, and convert that byte to the replacement character "FFFD;
- ["C0, "FF]: this byte should be followed by some continuation byte(s).

In the first two cases, `\use_none_delimit_by_q_stop:w` removes data that only the third case requires, namely the limits of ranges of Unicode characters which can be expressed with 1, 2, 3, or 4 bytes.

We can now concentrate on the multi-byte case and the `_continuation` auxiliary. We expect `#3` to be in the range ["80, "BF]. The test for this goes as follows: if the character code is less than "80, we compare it to –"C0, yielding `false`; otherwise to "C0, yielding `true` in the range ["80, "BF] and `false` otherwise. If we find that the byte is not a continuation range, stop the current slew of bytes, output the replacement character, and continue parsing with the `_start` auxiliary, starting at the byte we just tested. Once we know that the byte is a continuation byte, leave it behind us in the input stream, compute what code point the bytes read so far would produce, and feed that number to the `_aux` function.

The `_aux` function tests whether we should look for more continuation bytes or not. If the number it receives as `#1` is less than the maximum `#4` for the current range, then we are done: check for an overlong representation by comparing `#1` with the maximum `#3` for the previous range. Otherwise, we call the `_continuation` auxiliary again, after shifting the “current code point” by `#4` (maximum from the range we just checked).

Two additional tests are needed: if we reach the end of the list of range maxima and we are still not done, then we are faced with an overflow. Clean up, and again insert the code point "FFFD for the replacement character. Also, every time we read a byte, we need to check whether we reached the end of the string. In a correct UTF-8 string, this happens automatically when the `_start` auxiliary leaves its first argument in the input stream: the end-marker begins with `\prg_break:`, which ends the loop. On the other hand, if the end is reached when looking for a continuation byte, the `\use_none:n #3` construction removes the first token from the end-marker, and leaves the `_end` auxiliary, which raises the appropriate error flag before ending the mapping.

## 59.6.2 utf-16 support

The definitions are done in a category code régime where the bytes 254 and 255 used by the byte order mark have catcode 12.

```

15306 \group_begin:
15307   \char_set_catcode_other:N \^^fe
15308   \char_set_catcode_other:N \^^ff

```

`\__str_convert_encode_utf16:` When the endianness is not specified, it is big-endian by default, and we add a byte-order mark. Convert characters one by one in a loop, with different behaviours depending on the character code.

`\__str_encode_utf_xvi_aux:N`  
`\__str_encode_utf_xvi_char:n`

- [0, "D7FF]: converted to two bytes;

- ["D800,"DFFF] are used as surrogates: they cannot be converted and are replaced by the replacement character;
- ["E000,"FFFF]: converted to two bytes;
- ["10000,"10FFFF]: converted to a pair of surrogates, each two bytes. The magic "D7C0 is "D800 – "10000/"400.

For the duration of this operation, `\__str_tmp:w` is defined as a function to convert a number in the range [0, "FFFF] to a pair of bytes (either big endian or little endian), by feeding the quotient of the division of #1 by "100, followed by #1 to `\__str_encode_utf_xvi_be:nn` or its `le` analog: those compute the remainder, and output two bytes for the quotient and remainder.

*(End of definition for `\__str_convert_encode_utf16:` and others.)*

`__str_missing` When encoding a Unicode string to UTF-16, only one error can occur: code points in the range ["D800,"DFFF], corresponding to surrogates, cannot be encoded. We use the `__str_extra` all-purpose flag `@@_error` to signal that error.

When decoding a Unicode string which is purportedly in UTF-16, three errors can occur: a missing trail surrogate, an unexpected trail surrogate, and a string containing an odd number of bytes.

```

(End of definition for `__str_missing`, `__str_extra`, and `__str_end`.)

`__str_convert_decode_utf16:` As for UTF-8, decoding UTF-16 is harder than encoding it. If the endianness is unknown, check the first two bytes: if those are "FE and "FF in either order, remove them and use the corresponding endianness, otherwise assume big-endianness. The three endianness cases are based on a common auxiliary whose first argument is 1 for big-endian and 2 for little-endian, and whose second argument, delimited by the scan mark `\s__str_stop`, is expanded once (the string may be long; passing `\g__str_result_t1` as an argument before expansion is cheaper).

The `__str_decode_utf_xvi:Nw` function defines `__str_tmp:w` to take two arguments and return the character code of the first one if the string is big-endian, and the second one if the string is little-endian, then loops over the string using `__str_decode_utf_xvi_pair:NN` described below.

```

(End of definition for `__str_convert_decode_utf16:` and others.)

`__str_decode_utf_xvi_pair:NN` Bytes are read two at a time. At this stage, `\@@_tmp:w #1#2` expands to the character code of the most significant byte, and we distinguish cases depending on which range it lies in:

`__str_decode_utf_xvi_quad:NNwNN`

`__str_decode_utf_xvi_pair_end:Nw`

`__str_decode_utf_xvi_error:nNN`

`__str_decode_utf_xvi_extra:NNw`

- ["D8, "DB] signals a lead surrogate, and the integer expression yields 1 ( $\varepsilon$ -TeX rounds ties away from zero);
- ["DC, "DF] signals a trail surrogate, unexpected here, and the integer expression yields 2;
- any other value signals a code point in the Basic Multilingual Plane, which stands for itself, and the `\if_case:w` construction expands to nothing (cases other than 1 or 2), leaving the relevant material in the input stream, followed by another call to the `_pair` auxiliary.

The case of a lead surrogate is treated by the `_quad` auxiliary, whose arguments `#1`, `#2`, `#4` and `#5` are the four bytes. We expect the most significant byte of `#4#5` to be in the range ["DC, "DF] (trail surrogate). The test is similar to the test used for continuation bytes in the UTF-8 decoding functions. In the case where `#4#5` is indeed a trail surrogate, leave `#1#2#4#5 \s__str <code point> \s__str`, and remove the pair `#4#5` before looping with `\__str_decode_utf_xvi_pair:NN`. Otherwise, of course, complain about the missing surrogate.

The magic number "D7F7 is such that "D7F7\*"400 = "D800\*"400+"DC00—"10000.

Every time we read a pair of bytes, we test for the end-marker `\q__str_nil`. When reaching the end, we additionally check that the string had an even length. Also, if the end is reached when expecting a trail surrogate, we treat that as a missing surrogate.

`__str_overflow` There can be no error when encoding in UTF-32. When decoding, the string may not  
`__str_end` have length  $4n$ , or it may contain code points larger than "10FFFF". The latter case often happens if the encoding was in fact not UTF-32, because most arbitrary strings are not valid in UTF-32.

`__str_convert_decode_utf32`: The structure is similar to UTF-16 decoding functions. If the endianness is not given, test the first 4 bytes of the string (possibly `s__str_stop` if the string is too short) for the presence of a byte-order mark. If there is a byte-order mark, use that endianness, and remove the 4 bytes, otherwise default to big-endian, and leave the 4 bytes in place. The `__str_decode_utf_xxxii:Nw` auxiliary receives 1 or 2 as its first argument indicating endianness, and the string to convert as its second argument (expanded or not). It sets `__str_tmp:w` to expand to the character code of either of its two arguments depending on endianness, then triggers the `_loop` auxiliary inside an `e`-expanding assignment to `g__str_result_tl`.

The `_loop` auxiliary first checks for the end-of-string marker `s__str_stop`, calling the `_end` auxiliary if appropriate. Otherwise, leave the `(4 bytes)` `s__str` behind, then check that the code point is not overflowing: the leading byte must be 0, and the following byte at most 16.

In the ending code, we check that there remains no byte: there should be nothing left until the first `s__str_stop`. Break the map.
